69456. There should be an extended period of training for the younger officers after their arrival in India; and he suggested this should be two years, so that the officer might acquire knowledge of the country and of the language and have some knowledge of the special diseases of India. It was also important to provide a reserve of officers capable of filling up vacancies on the staffs of veterinary colleges and a system of study leave. A few years ago he had recommended that study leave should be granted to some of the officers in the Civil Veterinary Department, and arrangements were made accordingly, but study leave had been only granted to two of the officers and he understood the system had been stopped. Provided study leave was granted he would leave the selected officers considerable latitude. He would be prepared to grant facilities for a post-graduate course in his own college or allow them to spend the time at any place where they could get a proper training in research. It was possible that they might also be allowed to see the research which was going on at other recently established research institutes for the study of animal pathology in this country. They should also be given the alternative of going to Paris or spending part of their time in England and part in Paris or in Berlin or Budapest. The period of study leave would be definitely fixed and the officers should have permission to divide it up between the different selected places. The same course of study leave could not be provided for a candidate coming from an Indian Veterinary College. The average Indian veterinary graduate would not be qualified for a research course; he would not be like officers who had had a good general education and professional education on the top of which they had had practical experience. Such officers would be able to take part in research investigations and that was the best sort of training. He did not see any simple way by which an Indian trained in an Indian college could perfect his education in the colleges in England. Th only way was to endeavour to improve the education in the Indian colleges. If an Indian student simply came to England and put in one complete year in attending the final courses of instruction at a British veterinary college it would considerably improve his knowledge, and if on the top of that he attended a short post-graduate course in pathology and bacteriology that would still further improve his knowledge. That was quite practicable. But he could not make suggestions for giving courses to Indian veterinary graduates which would bring them up to the same level as European graduates. A year, together with a certain amount of research, was the nearest approach possible, without organising a special class; and unless there was a sufficient number of students the organisation of a course would be difficult and costly.

69457. (*Lord Ronaldshay.*) It was a mistake on Colonel Queripel's part to say that no one who did not possess the British diploma could attend the post-graduate course at any of the British colleges. The College did not admit to the post-graduate courses any other persons than qualified veterinary surgeons or medical men, but for that purpose a student was recognised as qualified who had obtained a diploma from one of the Indian Veterinary Colleges; and several Indian graduates had gone through the course.

69458. (*Sir Theodore Morison.*) The standard for admission to the Royal College of Veterinary Surgeons for the last sixteen or eighteen years had been the same as for admission to the profession of medicine; the Royal College of Veterinary Surgeons had adopted the regulations of the General Medical Council with regard to general education and those regulations were accepted. Latin was compulsory. He did not know whether that operated to keep Indian students out. As a matter of fact, the Royal College of Veterinary Surgeons at present were revising the rules with regard to general education, and a proposal had been put forward that Latin should not be insisted upon as a compulsory subject, as it was rather preferred that candidates should take modern languages like French or German. All the higher educational qualifications throughout the civilised world were accepted as equivalent to an entrance examination, especially those of British Possessions and India. The degrees in Arts of the different universities in India and some of the tests for admission to universities were accepted by the Royal College of Veterinary Surgeons. The Indian B.A. degree would not be accepted at present if it did not include Latin. There might be 70 or 80 different

qualifications granted throughout the world that were accepted provided they satisfied certain conditions.

69459. (*Sir Murray Hammick.*) Indians had come from Indian colleges to attend the post-graduate course, but he did not think a special course could be formed to enable Indians to become qualified up to the standard of the English qualification even by special lectures and special teaching, because their professional education from top to bottom had been elementary. An exceptional Indian student who had a good educational qualification and had taken a diploma from an Indian Veterinary College would be permitted to attend any of the ordinary courses of instruction given to undergraduates and if he had a qualification from an Indian Veterinary College he would be admitted to the post-graduate course, but not otherwise.

69460. (*Chairman.*) There had been several Indians who had done that, but no examination had been conducted to test the benefit they had derived from the post-graduate training.

(The witness withdrew.)

NOTE.

69461–70043. Attention is also invited to the following:—

I. Evidence given by Mr. F. C. Drake, Secretary in the Revenue and Statistics Department of the India Office, on Monday, 4th May, 1914. This will be found generally in paragraphs 66679–66719 in the sections of this volume (XV.) relating to the Forest Service and the Agricultural Department, and in particular in paragraphs 66696–7, 66708 and 66716.

Mr. Drake also put in the following statement with special reference to the Civil Veterinary Department:—

Statement to show the number of Officers appointed by the Secretary of State to the Indian Civil Veterinary Department from 1904 *to* 1914 (*end of April*) *inclusive.*

Year.	Europeans.	Indians.
1904	2	—
1905	4	—
1906	6	—
1907	5	—
1908	1	—
1909	1*	—
1910	1	—
1911	1	—
1912	2	—
1913	2	—
1914 (to end of April) ...	2	—
Total	27	—

* Includes one appointment to Muktesar in each year.

II. Memorandum on appointments made by the Secretary of State for India in Council to certain branches of the Government Service in India—*vide* Vol. I., Appendix.

LIST OF APPENDICES.

PAGE.

I.—Letter from the Chief Secretary to the Government of the Punjab, No. 238, dated 22nd October, 1913, forwarding the views of the Punjab Government 328

II.—Letter from the Government of the United Provinces, Industries Department, to the Secretary to the Government of India, Department of Revenue and Agriculture, No. 1293, dated the 15th September, 1913, containing the views of the Government of the United Provinces of Agra and Oudh on the Civil Veterinary Department 329

III.—Memorandum prepared by the Government of Bengal relating to the Civil Veterinary Department 329

IV.—Memorandum prepared by the Government of Bihar and Orissa relating to the Civil Veterinary Department 330

V.—Memorandum prepared by the Assam Administration relating to the Civil Veterinary Department 331

VI.—Note, dated the 9th April, 1913, by the Honourable Sir Archdale Earle, Chief Commissioner of Assam, on the Civil Veterinary Department 332

VII.—Note, dated the 1st August, 1913, by the Honourable Sir Archdale Earle, Chief Commissioner of Assam, on the Civil Veterinary Department, supplementary to his note of the 9th April, 1913 332

XI.—Memorandum prepared by the Administration of the Central Provinces and Berar relating to the Civil Veterinary Department 338

XII.—Statement of the Civil Appointments on Rs. 200 a month and over held by Europeans, Anglo-Indians, and Indians on the 1st April, 1913, in the Civil Veterinary Department (appointments under the Government of India) 339

XIII.—Statement (with details by Provinces) of the Provincial Establishment of the Civil Appointments on Rs. 200 a month and over held by Europeans, Anglo-Indians, and Indians on the 1st April, 1913, in the Civil Veterinary Department 340

XIV.—Regulations for appointment to the Indian Civil Veterinary Department 342

XV.—Officials and non-officials who furnished written evidence to the Royal Commission in connection with their enquiry into the Civil Veterinary Department, but who were not orally examined 342

APPENDIX I.

Letter from the Chief Secretary to the Government of the Punjab, No. 238 (Rev. and Agri.—Agri.), dated Lahore, 22nd October, 1913.

With reference to your letter* dated 1st August, 1913, I am directed to forward 20 copies of a letter from the Director of Agriculture and Industries, Punjab, No. 3453, dated 2nd October, 1913, and of its enclosures, furnishing the information required in connection with the Civil Veterinary . . . Department in the Punjab.

Enclosures in covering letter from the Director of Agriculture and Industries, Punjab, No. 3453, of Lahore, 2nd October, 1913.

Statement showing supplementary information as to the organisation of the Civil Veterinary Department in the Punjab.

1. *The present regulations as to recruitment, training and probation and whether these regulations are satisfactory.—(a) Army Officers of the Civil Veterinary Department.*—The practice of recruiting Civil Veterinary Department Officers from amongst the Army Veterinary Officers has been discontinued.

(*b*) *Indian Civil Veterinary Department Officers.*—The rules on these points are contained in the Government of India resolution, No. 10—8-4, dated 2nd August, 1901.

Satisfactory.

(*c*) *Provincial Service Officers.*—There are at present one Professor of Surgery and three Senior Assistant Professors in the Punjab Veterinary College who belong to the Provincial Veterinary Service. Recruitment is from graduates of the Punjab Veterinary College.

Not satisfactory. Post-graduate training is necessary.

2. *The rates of pay and allowances in force in* 1890, 1900 *and the present time, and whether the present rates of pay and allowances are satisfactory.—(a) Army Officers of the Civil Veterinary Department.*—

	1900. Military pay.	Civil allowance.
	Rs.	Rs.
Veterinary Lieutenants under 5 years' service	400	150
Veterinary Lieutenants after 5 years' service	450	200
10 years' service	500	250
Veterinary Captains	600	300
Veterinary Captains after 5 years' service in that class ...	650	350
Veterinary Major after 10 years' service as Veterinary Captain	750	400

Army Veterinary Officers serving in the Civil Veterinary Department were entitled to military rank and title and all other advantages conferred on Army Veterinary Officers by the Royal Warrant of pay and promotion.

The salary and rank of the Inspector-General, Civil Veterinary Department corresponded with those of Provincial Veterinary Officers in India, his total emoluments being Rs. 1,620 per mensem irrespective of rank.

	1913. Military pay.	Civil allowance.
	Rs.	Rs.
Lieutenants under 5 years' service	480	150
Captains—		
After 5 years' total service ...	570	200
After 7½ years' total service ...	570	300
After 5 years' service as such (or on completing 10 years' total service, if he received his commission before 5th October, 1898)	650	300
After 2½ years' total service ...	650	350
Major—		
After 15 years' total service ...	750	350
After 17½ years' total service ...	750	400
After 5 years' service as such (or after 20 years' total service if promoted on or before the 20th March, 1902) ...	800	500
Lieutenant-Colonel	1,120	500
Colonel	1,220	500

* Not reprinted.

The post of Inspector-General, Civil Veterinary Department, carrying a salary of Rs. 2,000 per mensem, had been abolished with effect from 1st April, 1912.

Not satisfactory. See paragraph 69248.

(*b*) *Indian Civil Veterinary Department Officers.*—The Civil Veterinary Department came into being in 1901. The pay is progressive. The pay on appointment is Rs. 500 per mensem, rising to Rs. 1,110 by annual increments of Rs. 40. After 20 years' service Rs. 1,200. The post of Inspector-General, Civil Veterinary Department, carrying a salary of Rs. 2,000, has been abolished from 1st April, 1912.

There are two allowances, viz., a local allowance of Rs. 100 per mensem, attached to the post of the Principal, Punjab Veterinary College, and a conveyance allowance of Rs. 50 per mensem has recently been sanctioned for the Superintendent, Government Cattle Farm, Hissar.

Not satisfactory. See paragraph 69248.

(*c*) *Provincial Service Officers.*—The post of Professor of Surgery in the Punjab Veterinary College is usually held by an Imperial Service Officer, but is at present held by a Provincial Service Officer drawing pay Rs. 600—25—700. The pay of the three senior Assistant Professors is Rs. 200—20—400.

Not satisfactory. See paragraph 69248.

3. *The number of posts in each grade, and the provision, if any, made in the cadre for leave and training.—(a) Army Officers of the Civil Veterinary Department.*—Further recruitment into Civil Veterinary Department of this class of officers has been discontinued. There are only three offcers of this class serving in the Punjab, one of whom is Colonel, one Lieut.-Colonel, and one Major of 17½ years' standing. There is no reserve for leave and training in the Punjab.

(*b*) *Indian Civil Veterinary Department Officers.*—Apart from the three posts held by the Army Officers in Civil employ seven officers of the Indian Civil Veterinary Department are employed in the Punjab, one of whom is in transit from long leave. There is no leave or training reserve for the Punjab.

(*c*) *Provincial Service Officers.*—Three posts in the grade. No leave or training reserve.

4. *What appointments outside the cadre are held, temporarily or otherwise, by the officers of the various Services.—(a) Army Officers of the Civil Veterinary Department.*—None.

(*b*) *Indian Civil Veterinary Department Officers.*—One temporary appointment of Camel Specialist is held by a member of the Indian Civil Veterinary Department.

(*c*) *Provincial Service Officers.*—The post of the Professor of Surgery is held by a Provincial Service Officer temporarily. On his vacating it it will be filled up by an Imperial Officer.

5. *Whether any addition is required to the present cadre.—(a) Army Officers of the Civil Veterinary Department.*—None.

(*b*) *Indian Civil Veterinary Department Officers.*—It is not clear what is regarded as our existing cadre. The posts required are:—

College.
1 Principal.
4 Professors.

District Work.
1 Chief Superintendent.
2 Superintendents.

Special.
1 Superintendent of Cattle Farm.
1 Camel Specialist.

Total ... 10 Indian Civil Veterinary Department Officers.

(*c*) *Provincial Service Officers.*—Yes. Three more Deputy Superintendents on Rs. 200—20—400 are required.

APPENDIX II.

Letter from the Government of the United Provinces, Industries Department, to the Secretary to the Government of India, Department of Revenue and Agriculture, No. 1293, dated the 15th September, 1913, containing the views of the Government of the United Provinces of Agra and Oudh on the Civil Veterinary Department.

I am directed to invite a reference to the correspondence* ending with Letter No. 2666, dated the 12th May, 1913, from the Appointment Department of this Government, submitting for transmission to the Public Services Commission a copy of the memorials* of Messrs. E. W. Oliver and C. W. Wilson of the Civil Veterinary Department of this Province, and to convey the opinion of the Lieutenant-Governor on the points raised in the memorials.

2. As regards the request for some compensation for the loss of the post of Inspector-General of the Civil Veterinary Department, it is obvious that although a very small number may be prejudiced by the abolition of the post the majority of the members of the Service could not hope to hold it. But at the same time its abolition does remove one desirable post from some of the ablest men of the Service who had reasonable hopes of attaining to it. Moreover, while the Secretary of State, in order to compensate the members of the Military Veterinary Officers in civil employ, has directed that no reduction should be made in the number of posts of Colonels, nothing has been done for the civilian members of the Department.

3. As regards the request for some general improvement in the conditions of the Service the complaint of the members of the Civil Veterinary Department is that their scale of pay was fixed before the recent rise in prices, that they have to live in expensive centres such as Lucknow, and that a great deal more work and responsibility is being imposed on them than formerly. Such drawbacks are common to most Services and but slowly reduce their popularity; combined, however, with other circumstances they may seriously affect recruiting. It is stated that appointments in the Veterinary Department are becoming unpopular in England owing to the fact that the emoluments do not compensate for the expenses of the scientific training now demanded. The great fall in the number of students at various British colleges within the last ten years is evidence of the decrease in attraction, and the reasons for this unpopularity are readily understood. A good deal of the work is of a distasteful nature, and it is probably the fact that the profession is not held in a very high social esteem. At the same time, partly owing to the spread of knowledge of the nature of animal diseases and partly owing to their intimate connection with public health, a much higher standard of scientific knowledge is being demanded from the members of the profession. This is specially true of India, where the Service calls for a sound bacteriological training. It therefore seems probable that some action will be necessary to improve the prospects of the Indian Civil Veterinary Department if a sufficient number of recruits to man the Department is to be forthcoming.

4. His Honour trusts, however, that this probable increase in the cost of the Service will be fully provided for before the Service is provincialised. I am in this connection to refer to my letter No. 571, dated the 19th April, 1913.

Sir James Meston is unwilling to regard this increase as an additional burden in the future on Provincial revenues, and hopes that the Imperial Government will see its way to cover the improvement by an assignment from the Imperial revenues.

5. I am to add that for the reasons already mentioned it appears to the Lieutenant-Governor to be highly improbable that Indians will be forthcoming of sufficient training to be appointed to the higher posts in the Department. Veterinary work has always been unpopular among educated Indians, and a man with the education and means to go through a course in an English veterinary college would almost certainly prefer some other line of life, while the Indian veterinary colleges must develop greatly before they could turn out men sufficiently well trained. They have not yet begun to attract the class of men who would profit by a higher scientific education.

* Not printed.

APPENDIX III.

Memorandum prepared by the Government of Bengal relating to the Veterinary Department.

THE IMPERIAL VETERINARY SERVICE.

1. *The present regulations as to recruitment, training and probation, and whether these regulations are satisfactory.*—The Imperial Civil Veterinary Department, as at present constituted, is composed of officers of the Army Veterinary Department electing to remain permanently in civil employ and of civilian officers recruited from the Veterinary Colleges in England. It has been decided that the Department in future is to be recruited entirely from the latter source.

The civilian officers are selected by the Secretary of State for India from among candidates ordinarily under twenty-seven years of age and possessing a diploma from the Royal College of Veterinary Surgeons. They are first appointed on probation for five years and are required to qualify in the vernacular within two years. It is usual for all officers on arriving at this country to obtain some training partly in the Bacteriological Laboratory at Muktesar and partly under a Superintendent in the provinces before being entrusted with responsible work.

The present regulations are working satisfactorily.

2. *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*—The Imperial Service was not organised before the year 1892. In 1900 the salary of Civil Veterinary Officers who were recruited from the Army Veterinary Department consisted of the Indian military pay and allowances of rank and a staff or civil allowance on the following scale:—

	Indian Military pay and allowances.	Civil allowances.
	Rs.	Rs.
Veterinary-Lieutenant—		
Under 5 years' service ...	400	150
After 5 ,, ...	450	200
After 10 ,, ...	500	250
Veterinary-Captain—		
After 5 years' service in that class	650	350
Veterinary-Major—		
After 10 years' service as Veterinary-Captain ...	750	400

The present rates of pay are as follows:—

(*a*) The pay of the civilian officers of the Department is on a time scale beginning on Rs. 500 a month and rising by Rs. 40 each year to Rs. 1,100, a further rise to Rs. 1,200 being given in the 21st year of service.

(*b*) The scale of pay for the military officers now in force (omitting ranks below that of Major, which are no longer represented in the service) is—

	Indian Military pay and allowances.	Civil allowances.
	Rs.	Rs.
Major—		
After 15 years' total service	750	350
After 17½ ,,	750	400
After 5 years' service as such	800	500
Lieutenant-Colonel	1,120	500
Colonel	1,220	500

Both the Superintendent, Civil Veterinary Department, and the Principal, Bengal Veterinary College, get house-rent according to salary under the special conditions applicable to the Calcutta House Allowance Scheme. The latter also gets a local allowance of Rs. 100 per mensem. They both get exchange compensation allowance.

So far as the Government of Bengal are aware suitable candidates are obtained for the present rates of pay, and if this assumption is correct, there seems to be no necessity to alter them.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—These officers are borne on a single cadre for the whole of India, and their pay being on time scale there are no grades. There are two officers attached to this Province. The Imperial cadre provides for a leave reserve.

4. *What appointments outside the authorised cadre are held, temporarily or otherwise, by officers of the various Services.*—None.

5. *Whether any addition is required to the present cadre.*—Yes; proposals are being formulated for the appointment of (1) an additional Veterinary Superintendent and (2) an additional Imperial Officer at the Belgachia College.

THE PROVINCIAL VETERINARY SERVICE.

1. *The present regulations as to recruitment, training and probation, and whether these regulations are satisfactory.*—The Provincial Veterinary Service consists of Deputy Superintendents and Veterinary Inspectors.

The Deputy Superintendents are recruited from specially selected veterinary graduates who have undergone a post-graduate course of study and have received the necessary training. They are appointed with the sanction of the Local Government.

Inspectors are recruited by selection from among the Veterinary graduates at the Bengal Veterinary College and by promotion from the ranks of Veterinary Assistants and are appointed with the approval of the Local Government.

There are no special rules for the recruitment, etc., of the officers of the Provincial Service. The Service is at present a small one, and the existing methods of recruitment are satisfactory.

2. *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*—In 1890 the Provincial Veterinary Service had not come into existence. In 1900 there were only three lecturers on Rs. 150—10—200 in the Provincial Service.

The existing rates of pay are shown below:—

Deputy Superintendents.

1st grade	Rs.	250—15—400
2nd ,, ...	,,	200—10—250
3rd ,, ...	,,	150—10—200

A local allowance of Rs. 100 per mensem is drawn by the Assistant Principal of the Bengal Veterinary College.

Inspectors.

1st grade	Rs.	150
2nd ,, ...	,,	130
3rd ,, ...	,,	115
4th ,, ...	,,	100
5th ,, ...	,,	90
6th ,, ...	,,	80
7th ,, ...	,,	70

Local allowances of Rs. 50 per mensem are attached to the posts of the Chief Inspector under the Glanders and Farcy Act and of the Prosecuting Inspector under the Cruelty to Animals Act.

The Government of Bengal are of opinion that in view of the important and responsible work falling on the Provincial Service the rates of pay of Deputy Superintendents should now be raised to Rs. 200—500 and of Inspectors to Rs. 100—200.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*

Deputy Superintendents.

			Number of posts.
1st grade	Rs.	250—15—400	1
2nd ,, ...	,,	200—10—250	2
3rd ,, ...	,,	150—10—200	3

Inspectors.

1st grade	Rs.	150	2
2nd ,, ...	,,	130	Nil.
3rd ,, ...	,,	115	3
4th ,, ...	,,	100	1
5th ,, ...	,,	90	1
6th ,, ...	,,	80	2
7th ,, ...	,,	70	5

N.B.—There are also two Inspectors on Rs. 100 and Rs. 110 each transferred from Eastern Bengal and Assam.

There is no provision in the cadre for leave and training.

4. *What appointments outside the authorised cadre are held, temporarily or otherwise by officers of the various Services.*—None.

5. *Whether any addition is required to the present cadre.*—The sanctioned cadre is sufficient for the present, but will have to be raised gradually as the staff of the Subordinate Service of Veterinary Assistants, who are mainly employed by local bodies, is increased.

APPENDIX IV.

Memorandum prepared by the Government of Bihar and Orissa relating to the Civil Veterinary Department.

IMPERIAL SERVICE.

1. *The present regulations as to recruitment, training and probation, and whether these regulations are satisfactory.*—The Superintendent of the Civil Veterinary Department in this Province is the only officer who belongs to the Imperial branch of the Service. The appointment of superintendents rests with the Government of India, and the conditions of recruitment, training and probation are described in the memorandum prepared by the Government of India. The Local Government have no recommendations to make under any of these heads, except that the period of probation might with advantage be curtailed from five years to three years. The objection to the longer period is that after the lapse of five years it is difficult for an officer to strike out a fresh career for himself and the resulting tendency must be to retain officers who are not altogether satisfactory and whose services might have been dispensed with more freely after the shorter term.

2. *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*—The present limit of pay is Rs. 1,200 per mensem which is attained in the 21st year of an officer's

service. The Local Government are disposed to think that a special grade limited to 10 per cent. of the Service might be created on Rs. 1,400, promotion to it being made by selection after 23 years' service.

This addition to the rospects of the Service would be a compensation for the loss of prospects entailed by the abolition of the Inspector-Generalship in 1912.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training; and* 4. *What appointments outside the authorised cadre are held, temporarily or otherwise, by officers of the various Services.*—There is only one appointment of superintendent in the Province and there are no appointments outside the authorised cadre. The provision for leave and training is an Imperial arrangement. One officer has recently been posted to Bihar and Orissa for training.

5. *Whether any addition is required to the present cadre.*—Proposals have recently been submitted by the Director of Agriculture for strengthening the supervisional staff of the Veterinary Department by the immediate addition of one superintendent and the ultimate addition of four superintendents. Government are disposed to think that the whole Province is too big a charge for a single officer, but they have not yet considered the Director's proposals in detail and are unable to say at present what increase, if any, will be recommended to the Government of India.

PROVINCIAL SERVICE.

According to the Memorandum prepared by the Government of India, the Provincial branch of the Veterinary Department includes Indian professors, assistant professors, lecturers, deputy superintendents, and inspectors. The first three classes are not represented in Bihar and Orissa as the Province does not yet possess a separate Veterinary College.

Provision exists in the present sanctioned staff for two Deputy Superintendents on pay ranging from Rs. 150 to Rs. 400 and for twelve Inspectors on pay ranging from Rs. 70 to Rs. 150. Hitherto no candidates of satisfactory qualifications and experience have been found to fill the two posts of Deputy Superintendent; and the Local Government experience very considerable difficulty in recruiting duly qualified inspectors and the subordinate staff of Veterinary Assistants, whose pay ranges from Rs. 30 to Rs. 70. At present an annual contribution of Rs. 20,000 is made by this Government towards the maintenance of the Belgachia Veterinary College in Calcutta from which its supply of Veterinary Inspectors and Assistants is obtained. The Local Government have now under consideration a proposal of the United Provinces Government for the establishment of a joint Veterinary College at Cawnpore. Before making any recommendations on the subject of the Provincial or subordinate services of the Veterinary Department the Local Government desire to consider the probable effects of the projected joint scheme of veterinary education. The educated middle classes of this Province do not take readily to veterinary work. It is possible that the necessity for obtaining the requisite preliminary training in Calcutta acts as an impediment, and that the difficulty might be lessened by the institution of a Veterinary College at Cawnpore where the language, manners, and character of the people are akin to those of Bihar. The recruitment and training of duly qualified Deputy Superintendents might thus be rendered possible, and this would affect both the strength of the superior supervisional staff and the prospects of the subordinate supervisional staff.

APPENDIX V.

Memorandum prepared by the Assam Administration relating to the Civil Veterinary Department.

IMPERIAL VETERINARY SERVICE.

1. *The present regulations as to recruitment, training and probation, and whether these regulations are satisfactory.*—The Imperial Veterinary Service in Assam comprises only the appointment of the Superintendent, Civil Veterinary Department. The methods of recruitment and probation are as prescribed by the Secretary of State. The existing rules contain no provisions regarding training. As regards recruitment, the remarks made in Chief Commissioner's note, dated the 13th December, 1912, on the Agricultural Department, apply generally to this Department also. The Chief Commissioner has no suggestions to offer with reference to training and probation.

2. *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*—The constitution of the Veterinary Department dates from 1907. The pay of an officer begins with Rs. 500 a month rising by Rs. 40 each year to Rs. 1,100, which rate will continue from the beginning of the 16th to the end of the 20th year of service; after the beginning of the 21st year, the salary will be Rs. 1,200 a month. No allowance is given to the incumbent except the usual travelling allowance.

The prospects of the Service have suffered owing to the abolition of the post of the Inspector-General on Rs. 1,800 a month. The Chief Commissioner would be glad to see the maximum rate of pay raised to Rs. 1,450 with, or to Rs. 1,600 without, private practice, the discretion resting with the Local Government. This would place a senior officer approximately on the same level as a senior Civil Surgeon. The Chief Commissioner would also support the grant of an extra charge allowance of Rs. 100 a month to Superintendents.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—One appointment only. No provision is made for leave and training.

4. *What appointments outside the authorised cadre are held, temporarily or otherwise, by officers of the various Services.*—None.

5. *Whether any addition is required to the present cadre.*—When the full cadre in the Provincial and Subordinate Services of the Department is worked up to, Assam may require a second Superintendent.

PROVINCIAL VETERINARY SERVICE.

1. *The present regulations as to recruitment, training and probation, and whether these regulations are satisfactory.*—The Provincial Veterinary Service consists of Veterinary Inspectors. They are recruited from among the Veterinary Assistants in the Province with due regard to their professional merit, academical and general qualifications and seniority in the Service. Their probationary period is one year during which the Inspector is deputed to undergo a post-graduate course in a selected Veterinary College for training in bacteriological work. In the opinion of the Chief Commissioner, the present regulations are satisfactory.

2. *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*—The present rate of pay of Veterinary Inspectors is Rs. 100—5—175 per mensem. They get no allowance except the usual travelling allowance. The present scale of pay is inadequate, and should be raised to at least Rs. 100—10—200. The Chief Commissioner, however, would not object to a scale of Rs. 100—10—300 as suggested in the memorandum prepared by Mr. Harris.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—There are three posts of Inspectors and no provision is made for leave and training.

4. *What appointments outside the authorised cadre are held, temporarily or otherwise, by officers of the various Services.*—None.

5. *Whether any addition is required to the present cadre.*—The Provincial cadre may eventually include two posts of Deputy Superintendents for the Brahmaputra and Surma Valleys and more Inspectors, but no immediate increase is required.

APPENDIX VI.

Note, dated 9th April 1913, by the Hon. Sir Archdale Earle, Chief Commissioner of Assam, on the Civil Veterinary Department.

1. The remarks made in my note on the Agricultural Department apply generally to this Department also.

PROVINCIAL VETERINARY SERVICE.

2. The present rate of pay of Veterinary Inspectors in this Province is Rs. 100—5—175. The Government of Eastern Bengal and Assam originally proposed to pay Rs. 100—10—250, but were overruled. Experience has shown that it is impossible to secure suitable candidates in this Province on the present rate of pay, and that the lowest pay which will attract such candidates is Rs. 100—10—200.

SUBORDINATE VETERINARY SERVICE.

3. The present sanctioned pay of Veterinary Assistants in this Province is Rs. 30—10-5—70 with the following allowances.—

Stationary Assistant.

Pay plus house allowance of Rs. 5 a month or free quarters.

Hill District Assistant.

Pay plus local allowance of Rs. 10 a month and house allowance of Rs. 5 a month or free quarters and fixed travelling allowance from Rs. 15 to Rs. 25.

Plains District Itinerant Assistant.

Pay plus local allowance of Rs. 12-8 a month and fixed travelling allowance from Rs. 15 to Rs. 25.

Staff Assistant.

Pay plus personal allowance of Rs. 30 a month with travelling allowance under the Civil Service Regulations.

Reserve Assistant.

Pay plus personal allowance of Rs. 10 a month when on duty in the moussil.

This rate of pay has been found by experience to be insufficient to attract the class of man required, and a rate of Rs. 45—10-5—75, with the same allowances, is required.

APPENDIX No. VII.

Note, dated the 1st August 1913, by the Hon. Sir Archdale Earle, Chief Commissioner of Assam, on the Civil Veterinary Department, supplementary to his note of the 9th April 1913.

Clause 3 of the Agreement executed by officers of the Civil Veterinary Department runs as follows:—

"3. That the party of the first part will devote his whole time to the duties of the Service, and will not engage, directly or indirectly, in any trade, business or occupation on his own account, and that he will not (except in case of accident or sickness certified by competent medical authority) absent himself from his said duties without having first obtained permission from the Government or its authorised officers."

1. The Government of Eastern Bengal and Assam instituted enquiries in the year 1909 as to whether Veterinary Superintendents were allowed in other Provinces to practise privately, and ascertained that there was no uniformity in this respect. Mr. Harris, Superintendent of the Civil Veterinary Department in Eastern Bengal and Assam, ascertained from the Inspector-General of his Department that he had no objection to him (Mr. Harris) being allowed private practice, provided that his work as a Government servant was not interfered with. The Government of Eastern Bengal and Assam therefore enquired of the Government of India whether, in view of Clause 3 of the Agreement, Mr. Harris could be allowed to undertake private practice. It was suggested that in places where there was a Veterinary Hospital, owners would be required to send their animals there, and the hospital fee only would be charged. In cases where the superintendent was required to visit the owner's house to give advice or to examine animals for soundness, a fee of Rs. 10 to Rs. 15 would be charged, and for operations a charge from Rs. 15 to Rs. 30 would be made. Private practice was to be undertaken only on condition that it did not interfere with departmental work.

2. The Government of India observed that when it was first decided to recruit civilians for the Civil Veterinary Department, it was definitely settled that they should be debarred from engaging in private practice. A rule to this effect was accordingly embodied in the conditions for appointment to the Department and the scale of pay offered to the candidates was fixed with reference to the restriction. They considered that this rule should be adhered to. Administrative officers of the Department, such as superintendents, were usually in charge of very large areas and of a number of veterinary assistants whose work required close inspection. It was essential that they should spend a considerable portion of their time in touring through their charges, and it was thought inadvisable to allow them to build up private practices at their headquarters or to engage in private work which might interfere with their duties. For these reasons the Government of India were not in favour of any relaxation of the ordinary rule of the Service in the case of Mr. Harris. It was added that if this officer were permitted to engage in private practice, a precedent would be established which might prove embarassing.

3. I have considered the matter very carefully, and am of opinion that in a Province like Assam, containing a large number of Europeans, who mostly possess valuable horses, some concession should be made. I learn that the Superintendent, Civil Veterinary Department, is continually being asked when on tour to attend to valuable animals. Heretofore he has done this, as far as practicable, without remuneration, in order to popularise his department. Two alternatives are possible. The Superintendent must either refuse to attend to all calls of this nature, or he must be allowed to charge a moderately high fee, which would have the desirable effect of restricting the number of cases which he was asked to attend. In view of the large number of valuable animals which there are in the Province, and the absence of any other veterinary practitioners, with the exception of the veterinary assistants, whose skill is not of a very high order, the adoption of the first alternative would involve serious inconvenience to the public.

For these reasons I think that the question should be reconsidered, at any rate, as regards Assam, and that the local administration should be given discretion in the matter.

APPENDIX VIII.

Memorandum prepared by the Government of Burma relating to the Civil Veterinary Department in Burma.

1. *The present regulations as to recruitment, training and probation, and whether these regulations are satisfactory.—Superior Staff.*—The original system of recruitment was to appoint officers with not less than 18 months' service in the Army Veterinary Department. This was discontinued in 1901, and the system of direct appointment by the Secretary of State from the English Veterinary Colleges was introduced. Candidates were required to be over 26 years of age and to possess a diploma from the Royal College of Veterinary Surgeons; they were to be on probation for five years. Rules for the officers of the Army Veterinary Department who elect for permanent employment in the Civil Veterinary Department were first published also in 1901, and have since been twice revised.

The Regulations governing admssion into the Department are generally satisfactory subject to the following remarks:—

(i) The possession of a diploma in Tropical Medicine and practical experience of contagious diseases should, other things being equal, be considered as entitling a candidate to preference,

(ii) The present period of probation (five years) might be reduced to three in view of the fact that most officers join the service at the age of 26 or 27.

(iii) A thorough acquaintance with the Vernacular of the Province is a *sine qua non* for success in this Department, and it should be made an express condition of employment that no officer will be confirmed in his appointment until he has passed in the Vernacular by the Higher Standard.

Inspecting Staff.—The rules and regulations affecting this Staff are satisfactory.

The wishes of the Government of India in respect of appointing a staff of Provincial Deputy Superintendents and Inspectors were laid down in a Circular of 1904 and the Local Government's scheme which was formulated on these lines provided for the recruitment of Deputy Superintendents from the ranks of Inspectors and for the recruitment of Inspectors from:—

(i) Selected students who have passed the University Entrance examination and who would be given scholarships to enable them to undergo a training at the Lahore Veterinary College.

(ii) Selected men from the staff of Veterinary Assistants who have passed the seventh standard examination (Vernacular).

Of these only the first were to be eligible for promotion to Deputy Superintendentships. The Government of India in accepting these proposals laid down the full three years' course of training and the College diploma as conditions of permanent appointment as Deputy Superintendents and Inspectors. Under this scheme three students were sent to the Bengal Veterinary College in 1907 with scholarships of Rs. 40—10—60 per mensem while seven Inspectors were appointed from among the Senior Assistants at once. Only the former Instructor at the Insein School has so far been appointed as a Deputy Superintendent.

2. *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*—The information required under this heading for the Superior and Inspecting Staffs is given in the attached statement.

Superior Staff.—A special allowance of Rs. 150 a month should be given to the officer in administrative charge of the department in each province, whatever his seniority.

Inspecting Staff.—The scale of pay provided for the officers of the Inspecting Staff is satisfactory.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—The number of posts in each grade is shown in the statement mentioned above. There are five leave reserve posts in the cadre of the Superior Staff, which may be drawn upon if local arrangement cannot be made. Officers from the Inspecting Staff may be appointed to fill short leave vacancies. No provision for leave and training exists in the cadre of the Inspecting Staff.

4. *What appointments outside the authorised cadre are held, temporarily or otherwise, by officers of the various Services.*—None.

5. *Whether any addition is required to the present cadre.—The Superior Staff* consists of three officers only. If it were doubled the increased number of officers would be fully employed, and the resulting diminution of cattle mortality and the improvement in the stock of the Province generally would amply compensate for the increased cost.

Inspecting Staff.—With one exception the existing sanctioned posts in the Inspecting Staff have not yet been filled.

Statement showing the Cadre of the Superior and Inspecting Staffs of the Civil Veterinary Department, Burma, in the years 1890, 1900 *and* 1913.

APPENDIX IX.

Memorandum prepared by the Government of Madras relating to the Civil Veterinary Department.

History of the department up to the date of formation of the Civil Veterinary Department. — The Civil Veterinary Department was created only in 1892. Prior to this, Veterinary Surgeons were obtained from the Military Department from time to time to undertake remedial measures for dealing with outbreaks of cattle disease. In 1864-65, such a Veterinary Surgeon was engaged for the first time in connection with an outbreak of cattle disease in Kurnool and the Nilgiris. The success attained on this and subsequent occasions, with the help of the Army Veterinary Officers, was so encouraging that the Government contemplated the employment of a Surgeon with the designation of Inspector of Cattle Diseases, to be in charge of operations for the prevention of cattle diseases, but the attempt to secure the services of an officer suitable for this purpose failed, and the matter remained in abeyance till 1881. In this year the Government resolved, in view of the extreme importance of dealing with cattle diseases on a more permanent footing, to obtain a Veterinary Officer with Indian experience as teacher of Veterinary Science in the School of Agriculture at Saidapet, who might also officiate as Inspector of Cattle Diseases. The Board of Revenue was asked to advertise in the Indian papers for an officer. Subsequently, it was decided to keep the post of Teacher of Veterinary Science distinct from that of Inspector of Cattle Diseases, and a Mr. Shunker was appointed as Inspector, while the duties of the Veterinary Instructor at the College were left in the hands of a Military Veterinary Surgeon.

2. The next holder of that post, who was also borrowed from the Army, was, however, entrusted with the dual duties of Veterinary Lecturer and Inspector of Cattle Diseases, the designation of the post held by Mr. Shunker being at the same time changed into "Deputy Inspector of Cattle Diseases." These officers were assisted by a subordinate staff of Stock Inspectors, each of whom was in charge of a district and under the immediate control of the District Collectors.

3. The organisation of the Veterinary Staff came under review of the Committee appointed by Government in 1888 to inquire into the constitution and operations of the Agricultural Department. The Committee found that the system of providing a single Inspector per district was of little or no use, and recommended an immediate and large increase in the number of Inspectors, but Government, in view of the apathy of the ryots and the cost of the operations, directed that the work of attempting to combat disease directly should be given up, and that the post of Inspector of Cattle Diseases should be abolished, the services of the Stock Inspectors, being at the same time dispensed with.

4. On a perusal of the Proceedings of this Government, the Government of India, however, urged the need for the retention of the staff of the Cattle Disease Department under the direction of the Agricultural Department, with a subordinate staff of an executive character; the Government of Madras thereupon accepted this recommendation and modified their former order.

5. In 1892, at the time of the organisation of the Civil Veterinary Department by the Government of India, there were on the staff of the department in Madras one Inspector of Cattle Diseases, one Deputy Inspector of Cattle Diseases, a few Stock Inspectors in the subordinate staff (corresponding to Veterinary Assistants of the present day).

6. *Formation of the Civil Veterinary Department.*— The question of the creation of a separate Civil Veterinary Department for the whole of India had been mooted as early as 1882, but was kept in abeyance till 1891, on financial considerations. The Government of India again took up the matter in 1891, and addressed the Secretary of State in their Despatch No. 82, dated 21st October, 1891, on the expediency of constituting a Civil Veterinary Department for the whole country. The Secretary of State sanctioned the proposal in his Despatch No. 18, dated 18th February, 1892. The superior staff of the department, as then sanctioned, consisted of 18 officers, including an Inspector-General, at their head. The staff was to be recruited from the Army Veterinary Department, and the officers were to receive the Indian pay and allowance of their military rank and a civil allowance on the scale laid down in paragraphs 18 and 19 of the Government of India Despatch No. 82 of 1891. The whole staff was to be borne on the Imperial list, but the officers were to carry out their duties under the orders of the respective local governments.

7. As already noted, there was one Army officer in Madras at the time of the constitution of the department, and he became the first Superintendent, Civil Veterinary Department, Madras. The Deputy Inspector of Cattle Diseases was thereafter designated "Deputy Superintendent, Civil Veterinary Department."

8. In 1901, a change was effected in the system of recruitment of the superior staff by obtaining officers for Civil employment from Army Veterinary Department, and the Government of India then decided that the candidates should in future be appointed by the Secretary of State direct from the English Veterinary Colleges, and rules for the recruitment of such candidates were also published. Officers of the Army Veterinary Department who elected to continue in the Civil Department do not come under these rules.

9. The Government of India, in 1905, took up the question of the general reorganisation of the department, and addressed the Secretary of State for sanction to increase the number of officers (25) on the Imperial staff of the department, in order to provide additional European officers for some of the more advanced Provinces. The scheme was accepted by the Secretary of State and the number of officers was then increased to 32 (at present 34). The increased cadre did not, however, provide for any additional officer in this Presidency. But the need of a second European Veterinary Officer was strongly felt, and, as a result of repeated requests, the Government of India sanctioned in 1909 the appointment of a second Superintendent to this Presidency. This second officer was posted as Principal of the Madras Veterinary College, under the control of the Superintendent, Civil Veterinary Department. In order, however, to avoid confusion of functions between the two officers, the Government subsequently defined the duties and responsibilities of each, and made the Principal of the College independent of the Superintendent. One is in charge of the executive branch and the other the educational branch of the department. The two officers work directly under the control of the Commissioner of Revenue Settlement, Land Records and Agriculture.

10. *Proposals of the Royal Commission on Decentralisation.*—The Royal Commission on Decentralisation suggested in paragraph 327 of their report the provincialisation of the superior officers of the Department serving in the Provinces. They stated:—

"Having regard to the local character of the "Civil Veterinary work, and to the circumstance "that in each Province it is under the general ad- "ministrative control of the Provincial Director "of Agriculture, we think it desirable that the "superior Veterinary Officers serving in the Pro- "vinces should be paid by and recruited on ac- "count of the local governments, as Provincial "Agricultural experts now are. This provincialis- "ing of the staff would eliminate a number of "references which now have to be made to the "Government of India, and would enable the "Veterinary Inspector-General to become in such

"matters the Advising Officer of the Provincial "Governments instead of being the head of a cen- "tralised controlling staff."

This suggestion was referred by the Government of India to the local governments for opinion. The Government of Madras in replying to their reference observed as follows:—

"So far as this Presidency is concerned no "difficulty has up till now arisen from the fact that "the two superior officers of the Civil Veterinary "Department in this Presidency . . . . are "borne on a single Imperial list and are paid "from Imperial revenues. This Government are "of opinion that, unless the staff of the Civil "Veterinary Department is materially increased, "a system of direct recruitment for Provincial "appointments is undesirable . . . . As re- "gards the question of pay of these officers, His "Excellency the Governor in Council is of opinion "that, so long as the Government of India control "the recruitment and posting of officers of the "Civil Veterinary Department, it is desirable, as "the Government of India recognise, that the cost "should continue to be debited to Imperial "revenues."

The Government of India, after ascertaining the views of the local governments, decided not to disturb the existing arrangements under which the superior offices were borne on the Imperial list and were paid from Imperial revenues. The question of provincialising the pay of the veterinary officers is again engaging the attention of the Government of India.

11. *Recruitment.*—When the Civil Veterinary Department was constituted in 1892, the Government of India laid down that as a rule the superior grades of the Department should be filled by European officers who should supervise and control the subordinate native agency employed on the bulk of the work of the Department. The Government of India also expressed the opinion that the European element in the service was indispensable, but that the possible expansion, in the number of European officers which, with the growth of responsibilities, may be demanded by Local Governments, might be confined within the narrowest limits by the employment of the educated natives of the country to relieve the labours of the European staff. The Government of India again reiterated the same policy in 1904 in the following terms:—

"While we desire to confine the European staff within the narrowest limits consistent with securing the efficient working of the Department and to employ the assistants trained in our Veterinary Colleges as far as is possible in the circumstances of each Province, we feel no doubt that for the present and for a good many years to come the superior supervising staff must as a rule be European."

12. *General remarks.*—The rules regarding pay, allowances, etc., applicable to Army Veterinary officers of the Civil Veterinary Department are different from those applicable to Civilian officers of the Department.

13. The salary* of Army Department officers consists of the Indian Military pay and allowances of rank and the staff or civil allowances according to a prescribed scale. Travelling allowances are granted under the Civil Service Regulations. Leave and leave allowances are regulated by the rules in the Civil Service Regulations applicable to Military officers subject to the Civil Leave rules with certain special conditions. Military officers may retire at 20 years' service. The rules in the Civil Service Regulations relating to the compulsory retirements of Military officers in Civil employ upon attaining the age of 55 years apply to Army officers in Civil Veterinary Department. Officers in the Civil Veterinary Department are debarred from private practice without the permission of the Local Government under which they serve.

14. The Civilian officers of the Department are debarred from private professional practice. The pay of these officers is fixed at Rs. 500 per mensem on arrival in India, rising by Rs. 40 each year to Rs. 1,100 a month, which rate will continue from the beginning of the sixteenth to the end of the twentieth year of service; after the beginning of the twenty-first year, Rs. 1,200 per mensem. All officers, Military and Civil, get exchange compensation allowance. Appointments of Civilian officers are made on probation for five years and subject to such rules as the Government of India may lay down in regard to qualification in the vernaculars. Officers who, after satisfactory completion of the probationary period, remain in the service of the Government of India will become entitled to the benefit of the leave and pension rules for European officers contained in the Indian Civil Service Regulations and will reckon service for leave and pension from the date of arrival in India on first appointment. Retirement is obligatory at 55 years of age.

15. The study leave rules for scientific departments are also applicable to officers of the Civil Veterinary Department. Every officer of the Civil Veterinary Department is required to pass an examination in the vernacular of the province in which he is serving within two years of the date on which he is posted to the province. Officers serving in Madras are required to pass in either Tamil, Telugu or Hindustani as the Government may decide; failure to pass entails loss of appointment.

16. The Principal of the College is allowed in addition to his pay a local allowance of Rs. 100 per mensem and a house-rent allowance of Rs. 50 per mensem debitable to Provincial revenues until he is provided with free quarters. The Superintendent is also granted a house-rent allowance of Rs. 50 per mensem. The Imperial officers of the Department are liable to transfer from one province to another. All questions affecting their appointment, promotion, leave for more than six months (for less than six months also if a substitute is required), transfer and retirement are dealt with by the Government of India in the Department of Revenue and Agriculture.

PROVINCIAL SERVICE.

17. A scheme for the organisation of a staff of local Cattle Disease Inspectors was formulated in 1878, but allowed to remain in abeyance until 1882, when the subordinate staff was first recruited. This staff comprised nine Inspectors to start with and was employed under the Inspector and Deputy Inspector of Cattle Diseases.

18. The Provincial supervising staff consisted of only one Deputy Inspector of Cattle Diseases until 1887. In that year a proposal was made to combine the functions of the superior officers of both the Veterinary and Agricultural branches of the Agricultural Department, so as to allow of better results being obtained with the small staff then available; but the only change effected was the appointment of a Sub-Assistant Director of Agriculture who was practically an Assistant to the Inspector of Cattle Diseases, but was also available for agricultural work on special occasions. The same staff continued until 1892 when the Civil Veterinary Department was constituted, and even then no actual change was effected except that the designation of the Deputy Inspector was changed to that of "Deputy Superintendent, Civil Veterinary Department."

19. After the constitution of the Civil Veterinary Department the Government of India themselves took up the question of subordinate veterinary establishment required to help the European Veterinary officers appointed to each province. They formulated schemes, one in 1893 and another in 1895, both of which were, in the opinion of the Madras Government, not suited to the circumstances of this Presidency. On a further reference from the Government of India in 1899, it was finally decided to retain the appointment of Deputy Superintendent and to add two Senior Veterinary Assistants (afterwards called Inspectors). The Government of India agreed to this arrangement. But

* The scale of pay is as follows:—

	Indian pay and allowances.	Civil allowance.
Major—	Rs.	Rs.
After 15 years' total service ...	750 ...	350
After 17½ years' total service ...	750 ...	400
After 5 years' service as such ...	800 ...	500
Lieutenant-Colonel	1,120 ...	500
Colonel	1,220 ...	500

The post of the Deputy Superintendent was allowed to remain vacant from 1901 owing to the paucity of trained hands competent to fill it. In 1904 the question of the development of the Civil Veterinary Department engaged the attention of this Government with reference to certain suggestions of the Supreme Government, and proposals were submitted in 1905 to the Government of India for the reorganisation of the Department. The scheme provided for the appointment of—

3 Deputy Superintendents			
15 Veterinary Inspectors	In-	6 in the first grade 9 in the second grade	Provincial service.
132 Veterinary Assistants	As-	13 in the first grade 40 in the second grade 79 in the third grade	Subordinate service.

This scheme was sanctioned by the Secretary of State in his despatch No. 57 (Revenue), dated 26th April, 1907.

20. *Recruitment and training.*—Up to 1895 there was no recognised system followed by Government; but there was no bar to the appointment of Indians. In 1895 the Government of India proposed that a complete scheme of Senior Veterinary Assistants should be organised in each Province. This was not, however, adopted. In 1904 the Government of India suggested, with a view to afford relief to the Imperial officers, the employment of indigenous agency, and observed as follows:—

"The Secretary of State has recently urged upon the Government of India the desirability of employing as far as possible the cheaper agency of native Veterinary Graduates. . . . . It appears to the Government of India, therefore, that the system on which the Veterinary Department should in future be developed is that each Province should have one, or in the case of larger Provinces, two European Superintendents drawn from the Imperial staff, and that this staff should be supplemented by the appointment of Native Assistants as 'Deputy Superintendents.' The men would be specially selected Veterinary Graduates with a thorough knowledge of English and good educational qualifications. They would be capable of filling the important subordinate appointments at the Veterinary Colleges." The Madras Veterinary College was established in 1903, and a diploma awarded to students after a three years' course at the College is a necessary preliminary to appointment to the rank of Inspector. Appointments to Inspectors' grade are made mainly by promotion from the subordinate service, while Deputy Superintendent's posts are intended to be filled either by direct recruitment or by promotion from among the Inspectors. One of the three sanctioned posts of Deputy Superintendents is now held by an Indian—a graduate of the Bombay Veterinary College—who was promoted from the grade of a Veterinary Inspector. There are an Assistant Principal and three lecturers at the College. The Assistant Principalship is a gazetted appointment. The Assistant Principal is placed on the same status as Deputy Superintendents. The present incumbent is a student of the Bombay Veterinary College. He was previously employed as Veterinary Overseer in the Remount Department, United Provinces of Agra and Oudh.

Organisation.—The Deputy Superintendents, the Inspectors, and teaching assistants at the College are all paid from Provincial funds. The executive staff is under the direct control of the Superintendent, Civil Veterinary Department, and the teaching staff under the Principal.

Numbers and pay.—The strength of the Department on 1st April, 1887, was—

One European Inspector of Cattle Diseases on Rs. 800 (no longer on the Provincial List).

One European Deputy Inspector of Cattle Diseases on Rs. 300.

Twenty-three Local Cattle Disease Inspectors (on pay* ranging between Rs. 50 and Rs. 100).

The present strength is—

Staff contemplated.		*Staff on 1st April, 1913.*
Three Deputy Superintendents (200-25-400).		One Deputy Superintendent.
Fifteen Inspectors	Six in the first grade. Rs. 100-4-120; nine in the second grade, Rs. 85-3-100.	Seven Inspectors.

The staff employed on teaching in the college is as under:—

One Assistant Principal on Rs. 200—25—400.
First Lecturer on Rs. 120—8—200.
Second ,, on ,, 100—5—150.
Third ,, on ,, 80—4—120.

The posts of Deputy Superintendents, Inspectors and Teaching Assistants are held by Indians.

Leave and pension rules.—The ordinary Indian Service leave and pension rules of the Civil Service Regulations apply to the Provincial Service.

II.

[*Additional statement called for in the Joint Secretary's letter dated 1st August*, 1913.]

INDIAN CIVIL VETERINARY DEPARTMENT.

1. *The present regulations as to recruitment, training, and probation, and whether these regulations are satisfactory.*—(*a*) The present system of recruitment is satisfactory.

(*b*) In the past there has been difficulty in arranging for an officer to become familiar with the actual conditions of the country and to acquire some knowledge of general administration, owing to the fact that by reason of the paucity of the leave reserve he is very often drafted into executive posts soon after his arrival. It would be advantageous if this could be remedied.

(*c*) The present period of probation may be reduced to three years.

2. *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*—

1890.

One Inspector of cattle diseases, Rs. 550 (now Superintendent, Civil Veterinary Department), house rent allowance, Rs. 50 per mensem.

1900.

One Superintendent, Civil Veterinary Department, Rs. 650 with exchange compensation allowance (Rs. 450 per annum) and house rent allowance, Rs. 50 per mensem.

1913.

Rs. 500—40—1,100; after the beginning of the twenty-first year, Rs. 1,200 a month; also draws exchange compensation allowance. (This rate applies to Superintendent, Civil Veterinary Department, and Principal, Veterinary College.) Principal gets Rs. 100 local allowance, and Rs. 50 house rent allowance. The Superintendent gets only Rs. 50 house rent allowance.

The allowances are satisfactory.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—There are no grades. The Superintendent and the Principal are the only two officers serving in this Province. Leave and training are arranged for by the Government of India.

4. *What appointments outside the authorised cadre are held, temporarily or otherwise, by Officers of the Service.*—No appointments are so held.

5. *Whether any addition is required to the present cadre.*—A second Superintendent may be required as soon as the operations of the Department expand.

PROVINCIAL SERVICE.

(i) The need for recruitment of Deputy Superintendents is beginning to be felt. It is

* Aggregate pay Rs. 17,260.

under contemplation to institute a post-graduate course at the Veterinary College for the purpose. Until the results of the experiment are known, it seems premature to consider the matter. The same remark applies to the training and probation of Deputy Superintendents.

(ii)—

1890.

One Deputy Inspector, Rs. 300.

1900.

One Deputy Superintendent, Rs. 150—10—200.

1913.

(1) Deputy Superintendent, Rs. 200—25—400.

(2) Assistant Principal, Madras Veterinary College, Rs. 200—25—400.

(3) Veterinary Inspectors, first grade, Rs. 100—4—120. Second grade, Rs. 85—3—100.

The rates of pay would seem to be sufficient.

(iii)—

	Sanctioned cadre.	Number now employed.
Deputy Superintendents ...	3	1
Assistant Principal graded with Deputy Superintendents ...	1	1
Veterinary Inspectors—		
First grade	6	2
Second ,, ...	9	5

No provision exists in the cadre of Deputy Superintendents and Inspectors for leave and training. The Inspectors are, however, recruited from among the Veterinary Assistants, in which class 22 posts have been created as reserve for leave and other contingencies.

(iv) There is an appointment of Special Veterinary Inspector in the Forest Department to which the Assistants and Inspectors of the Civil Veterinary Department can aspire. It is at present held by an Inspector of the Civil Veterinary Department.

(v) No additions are at present necessary.

APPENDIX X.

Memorandum prepared by the Government of Bombay relating to the Civil Veterinary Department.

1. *The present regulations as to recruitment, training and probation.—(a) Rules for the officers of the Army Veterinary Department in the Civil Veterinary Department.—1.* The selection of officers for particular appointments will be made by the Government of India.

2. An officer who accepts permanent appointment in the Civil Veterinary Department elects for continuous Civil employment in India.

3. Officers of the Civil Veterinary Department will be liable to transfer from one appointment to another or from one province to another. They will be under the control of the Local Government under which they are serving for the time being.

Rules for the civilian members of the Indian Civil Veterinary Department.—1. The officers of the Indian Civil Veterinary Department perform or supervise all official veterinary work in India, other than that of the Army, and are debarred from private professional practice in India. Their duties may be divided into three classes under the following heads:—

(*a*) Educational work in Veterinary Colleges;

(*b*) Horse and mule breeding;

(*c*) Cattle disease and cattle breeding.

2. Appointments to this Department are made by the Secretary of State for India, and applications regarding them should be addressed to the Revenue Secretary, India Office, London, S.W.

3. Candidates must not (except on special grounds to be approved by the Secretary of State) be over 26 years of age and must possess a diploma from the Royal College of Veterinary Surgeons. Evidence of a knowledge of bacteriology and of capacity for carrying out original research will be specially taken into account in estimating the claims of candidates. Good health, a sound constitution, and active habits are essential, and candidates must be certified by the Medical Board of the India Office to be physically fit for service in India.

4. Appointments will be made on probation for five years. Officers may be required from time to time to qualify in the vernacular language of the province within two years from the date of arrival in India, and in the event of transfer from one province to another, within two years from date of transfer.

(*b*) *Rules for the examination of officers of the Civil Veterinary Department in the Vernacular language.—1.* An officer of the Civil Veterinary Department must pass an examination by the Lower Standard in the vernacular of the province in which he is serving within 18 months of the date of his final election for Civil employ, or of the date on which he is posted to the province, whichever is later. Within three years of this date he must also pass a further examination in the vernacular of his province by the Higher Standard, unless he joined the Civil Veterinary Department before July, 1895. Failure to pass within the prescribed period will, in the absence of special orders to the contrary, entail loss of Civil allowances. But the Local Government may extend the period for passing.

2. The Lower and Higher Standards in vernacular shall ordinarily mean the Lower and Higher Standards in Hindustani prescribed by Army Regulations, India, Volume II. The Higher Standard examination shall include ability to transliterate from Persian into Nagri and *vice versâ*.

(*c*) As at present advised, Government consider that the regulations as to recruitment, training, and probation for the Civil Veterinary Department are satisfactory.

2. *The rates of pay and allowances in force* in 1890 *and* 1900 *and on 1st April,* 1913, *respectively.—(a)* These dates are not suitable for the Civil Veterinary Department. The Department commenced in 1892-93; new terms were issued in 1901 both for Military men and Civilians, and the terms for Military men were revised in 1908. It has been considered advisable to alter the dates to 1892, 1901, and 1st April, 1913.

(*b*) (*1*) In 1892 the following rates were in force for Military officers. These terms were issued for general information in 1895, but the rates of pay and allowances were in force from 1892:—

	Indian Military pay and allowances.	Civil allowances.	Total.
Veterinary Lieutenant—	Rs.	Rs.	Rs.
Under five years' service	400	150	550
After five years' service	450	200	650
After ten years' service	500	250	750
Veterinary Captain—	600	300	900
After five years' service in that class	650	350	1,000
Veterinary Major—			
After ten years' service as Veterinary Captain	750	400	1,150

The salary and rank of the Inspector-General of the Civil Veterinary Department corresponded with those of the Principal Veterinary Officer in India, his total emoluments being Rs. 1,620 a month irrespective of rank in the Army (*vide* rules for the Civil Veterinary Department published in Govern-

ment of India Resolution No. 10—59-5, dated 28th June, 1895).

At that time Lieutenants became Captains after 10 years; Captains became Majors after 20 years (*vide* Classified List of Officers of the Civil Veterinary Department, dated 1st January, 1899).

(*2*) The following was the scale of pay for Military Officers of the Civil Veterinary Department sanctioned in 1901 (*vide* Government Resolution, Revenue Department, No. 6194, dated 3rd September, 1901, and its accompaniments):—

	Indian Military pay and allowances.	Civil allowances.	Total.
Veterinary Lieutenant—	Rs.	Rs.	Rs.
Under five years' service	400	150	550
After five years' service	450	200	650
After ten years' service	500	250	750
Veterinary Captain—	600	300	900
After five years' service as such.	650	350	1,000
Veterinary Major—			
After ten years' service as Veterinary Captain.	750	400	1,150
After five years' service as Veterinary Major.	750	500	1,250
Veterinary Lieut.-Colonel	1,020	500	1,520

The pay of the Inspector-General of the Civil Veterinary Department was fixed at Rs. 1,800 a month irrespective of rank.

At that time Lieutenants became Captains after 10 years' service, and Majors after 20 years' service (*vide* Classified List of 1st July, 1902).

(*3*) The following is the scale of pay sanctioned by the Secretary of State in 1908, superseding a similar scale which was sanctioned in 1905, which in its turn superseded the scale of 1901 (*vide* Government Resolution, Revenue Department, No. 3419, dated 1st April, 1908). This scale was in force on 1st April, 1913, except that the Inspector-General's appointment had been abolished:—

	Indian Military pay and allowances.	Civil allowances.	Total.
Lieutenant—	Rs.	Rs.	Rs.
Under five years' service	480	150	630
Captain—			
After five years' total service.	570	200	770
After seven and a half years' total service.	570	300	870
After ten years' total service.	650	300	950
After twelve and a half years' total service.	650	350	1,000
Major —			
After fifteen years' total service.	750	350	1,100
After seventeen and a half years' total service.	750	400	1,150
After five years' service as such.	800	500	1,300
Lieut.-Colonel	1,120	500	1,620
Colonel	1,220	500	1,720

The pay of the Inspector-General, Civil Veterinary Department, was fixed at Rs. 2,000 a month irrespective of rank.

At present all the Majors in the Department have obtained their majority at 15 years' service and all Lieutenant-Colonels at 25 years' service or under.

(*c*) In 1892 there were no Civilians in the Department. The scale of pay for Civilians in 1901 was:—

Rs. 500—40—1,100 for the first 15 years.

After twentieth year—Rs. 1,200.

The scale laid down in 1901 was still in force on 1st April, 1913, except that the Inspector-General's appointment was abolished.

(*d*) Government reserve their opinion on the question whether the present rates of pay and allowances are satisfactory.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—(*1*) Among the Military men the pay is according to rank, and the numbers in each grade are governed by paragraph 3 of the rules for the officers of the Army Veterinary Department who were elected for permanent appointment in the Civil Veterinary Department (*vide* accompaniments to Government Resolution, Revenue Department, No. 3419, dated 1st April, 1908). It is laid down that not more than three officers, excluding the Inspector-General, will hold the rank of Colonel and Lieutenant-Colonel at the same time. The number in the rank of Major is unlimited.

(*2*) There are no grades for Civilian members of the Department.

(*3*) The number of appointments is as below:—

2 Superintendents (Military).

1 Principal (Civilian).

1 Assistant Principal (Civilian).

(*4*) The provision for leave reserve is five as sanctioned by the Secretary of State (*vide* Government Resolution, Revenue Department, No. 5720, dated 12th June, 1906, and its accompaniments).

4. *What appointments outside the authorised cadre are held temporarily or otherwise by officers of the various services?*—Nil.

(*b*) THE SUBORDINATE CIVIL VETERINARY SERVICE.

1. Deputy Superintendents are, as a rule, appointed by Government from the ranks of the Veterinary Inspectors. These officers are permitted to rejoin the Veterinary College for further studies. No period of probation is fixed.

2. These appointments were not in existence in 1890 and 1900. On 1st April, 1913, the rates of pay were as follows:—

	Rs.
First Grade	400
Second Grade	350
Third Grade	275
Fourth Grade	200

3. The number of posts in each grade is as below:—

		Rs.
3	Deputy Superintendents, fourth grade ...	200
2	do. third grade ...	275
2	do. second grade...	350
1	Deputy Superintendent, first grade ...	400

Three posts—one in the first grade, one in the second grade and one in the fourth grade—are vacant. The cadre provides for four appointments at the Veterinary College and four appointments for district work. No provision is made in the cadre for leave and training.

4. No appointments are held outside the authorised cadre by officers of this department.

5. Government consider that no addition is required to the cadre of the Civil Veterinary Department, so far as can be seen at present.

APPENDIX XI.

Memorandum prepared by the Administration of the Central Provinces and Berar relating to the Veterinary Department.

1. *Recruitment, training, and probation.*—(*a*) *Imperial Service.*—Appointments are made by the Secretary of State from the members of the Royal College of Veterinary Surgeons under regulations which apply to all the Provinces of India alike. The conditions of service are given in the Government of India Revenue and Agriculture Department's Memorandum on this Department.

Appointments were, until 1901, made entirely from the ranks of the Army Veterinary Department.

(*b*) *Provincial Service.*—This consists of Deputy Superintendents and Veterinary Inspectors. The scheme to be worked up to, and already sanctioned, contemplates a Deputy Superintendent for each Revenue Division and one at the Superintendent's headquarters, and one Inspector in each district. No definite rules have been drawn up for their recruitment, training, or probation. It is expected that most of the posts of Veterinary Inspectors will be filled sooner or later by recruitment from the staff of Veterinary Assistants of the Subordinate Service. For Deputy Superintendents, recruitment may be direct or from the ranks of Inspectors.

The Veterinary Assistants are trained at the Veterinary Colleges of Bombay, Calcutta, or Lahore, and a limited number of scholarships are granted each year to enable men to undergo the necessary training.

(*c*) *Remarks.*—The present arrangements for the recruitment, training, and probation of officers of the Imperial and Provincial Services are satisfactory, and Mr. Crump has no suggestions to make for their improvement.

2. *Pay and allowances.*—(*a*) *Imperial Service.*—These are detailed in the Government of India's Memorandum on this Service referred to above.

The pay of officers is—

	Rs.
From the 1st to the 15th year of service	500—40—1,100
From the 16th to the 20th year	1,100
From the 21st year	1,200

The service of officers drawn from the Army Veterinary Department to form the Indian Civil Veterinary Department was not finally organised till 1895. The rates of pay and allowances of these officers in Civil employ are given as in force in the year 1900, at page 29, and for the present day at page 45 of the Blue Book of Papers on the Civil Veterinary Department published by the Government of India.

(*b*) *Provincial Service.*—The Provincial Branch of the Service was completely reorganised, with a greatly increased cadre, and improved pay, in 1913. The sanctioned rates of pay are as follows:—

Deputy Superintendents.

Rs. 150—10—250, and then
Rs. 250—20—400.

It is open to the Administration to declare that any person whom it sees fit to appoint as a Deputy Superintendent shall draw on his first appointment such sum, within these limits of pay, as it may consider desirable to offer. This will enable the Chief Commissioner to appoint from outside the Provinces men of some seniority who will be useful at once.

Veterinary Inspectors.

Rs. 100—10—150.

Until 1913 the sanctioned rate of pay for Inspectors was Rs. 80—10—150.

3. *The number of posts in each grade and the provision for leave and training.*—(*a*) *Imperial Service.*—There is only one officer permanently posted to the Provinces, namely, the Superintendent of the Department, but occasionally, as at present, there is an additional Superintendent.

The leave reserve required is too small to be maintained separately for each Province, and is, therefore, managed by the Government of India.

(*b*) *Provincial Service.*—There are no grades, and pay, as above indicated, is on a time scale.

There are at present two Deputy Superintendents appointed out of the cadre of six which has been sanctioned. There is no leave or training reserve.

There are eight Veterinary Inspectors, and 22 such posts have been sanctioned.

4. *Appointments outside the authorised cadre.*—Nil.

5. *Additions to the cadre.*—(*a*) *Imperial Service.*—In no Department, perhaps, has work increased so rapidly as in the Veterinary Department. The Government of India have several times posted a second Superintendent to the Provinces, and at the present time there are two Superintendents. It is, however, a matter of the greatest urgency that there should be two Superintendents permanently posted to the Provinces, and the Government of India have more than once been asked to sanction this measure. The Chief Commissioner thinks that in the near future a staff of three superior officers will be the minimum that can meet the needs of the Provinces.

(*b*) *Provincial Service.*—The cadre sanctioned in 1913 provides for 6 Deputy Superintendents and 22 Inspectors. It is not intended that the whole of this staff shall be entertained at once; neither the men nor the funds are available. No further additions to the sanctioned cadre are needed at present.

APPENDIX XII.

Statement of the Civil Appointments on Rs. 200 *a Month and over held by Europeans, Anglo-Indians, and Indians on the* 1*st April,* 1913, *in the Civil Veterinary Department* (*Appointments under the Government of India*).

Pay.	Number of Employés in each Grade or Class.

APPENDIX XIV.

Regulations for appointment to the Indian Civil Veterinary Department.

1. The officers of the Indian Civil Veterinary Department perform or supervise all official veterinary work in India other than that of the Army, and are debarred from private professional practice in India. Their duties may be divided into three classes, under the following heads:—

(*a*) Educational work in veterinary colleges.
(*b*) Horse and mule breeding.
(*c*) Cattle disease and cattle breeding.

2. Appointments to this Department are made, as vacancies occur, by the Secretary of State for India, and applications regarding them should be addressed to the Revenue Secretary, India Office, London, S.W.

3. Candidates must not (except on special grounds to be approved by the Secretary of State) be over 26 years of age, and must possess a diploma from the Royal College of Veterinary Surgeons. Evidence of a knowledge of bacteriology, and of capacity for carrying out original research, will be specially taken into account in estimating the claims of candidates. Good health, a sound constitution, and active habits are essential, and candidates must be certified by the Medical Board of the India Office to be physically fit for service in India.

4. Pay will be as follows:—On arrival in India Rs. 500 a month, rising by Rs. 40 each year to Rs. 1,100, which rate will continue from the beginning of the 16th to the end of the 20th year of service; after the beginning of the 21st year Rs. 1,200 a month.

Extra allowances of Rs. 100 to Rs. 200 a month are attached to certain appointments, and house rent is allowed in certain cases.

5. Appointments will be made on probation for five years. Officers may be required from time to time to qualify in the vernacular language of the province within two years from the date of arrival in India, or, in the event of transfer from one Province to another within two years from date of transfer.

6. On appointment a free first-class passage to India will be granted, subject to the condition that its cost shall be refunded in the event of an officer resigning the Service, on grounds other than certified ill-health, within five years from the date of his arrival in India. If on the expiry of the five years of probation the officer's Service is determined, or if he is compelled by certified ill-health to resign the Service before such expiry, he will be provided with a free first-class passage back to England.

7. Officers who, after satisfactory completion of the period of probation, remain in the service of the Government of India, will become entitled to the benefit of the Leave and Pension Rules for European officers contained in the Indian Civil Service Regulations (regarding which information can be obtained from the Revenue Secretary, India Office, London, S.W.), and will reckon service for leave and pension from the date of arrival in India on first appointment. Retirement is obligatory at 55 years of age.

8. Officers will be required to make provision for their families by subscribing to a Provident Fund under such regulations as Government may from time to time lay down.

9. Each officer will be required, before leaving this country, to enter into an agreement with the Secretary of State for India embodying the conditions of his appointment.

India Office, June, 1912.

APPENDIX XV.

Officials and non-officials who furnished written Evidence to the Royal Commission in connection with their enquiry into the Civil Veterinary Department but who were not orally examined.

Improvement of Prospects necessary ... p. 329
Military officers ... ... p. 335
Provincial Service, particulars, *Brand* ... 69312
Work of, *Pease* 69262
(*see also* Leave, Pay, *etc.*)

D

Deputy Superintendents:
Creation of ... ... p. 336
Number of posts in each grade, Bengal ... p. 330
PAY:
Rates in Bengal, improvement advocated, *Brand* ... ... 69313, 69321; p. 330
proposed Scale, *Buxy*... 69372
Varies in different Provinces, and proposed scale, *Pease* 69264
RECRUITMENT:
Direct, not favoured as a whole, but rule should not be abolished, *Hewlett* ... 69418
Method, *Pease* ... ... 69270; p. 330
by Promotion from Subordinate Department preferred to direct recruitment, *Pease*... 69270
Scheme, *Brand* 69310-1, 69325
Selection from most able men, irrespective of seniority, advocated, *Buxy* 69372
(*see also under names of provinces.*)
Director of Agriculture:
APPOINTMENT OF MEMBER OF AGRICULTURAL DEPARTMENT AS:
would not be Approved, *Pease* and *Farmer*, 69252; *Pease*, 69265-6, 69268-9, *Aitchison*, 69350.
would be Unpopular with Veterinary Department, direct representation with Revenue member desired, *Smith*, 69307; *Hewlett*, 69399.
Director of Agriculture—*continued.*
System of head of department being, has worked fairly well, and selection of head from Civil Veterinary Department desirable, *Pease* and *Farmer* 69252
Drake, F. C., attention called to evidence of 69461
D'Silva, G. T., evidence of 69357-69370

E

Earle, Sir Archdale, notes by ... ... p. 332

F

Farmer, Lieutenant-Colonel J., evidence of 69244-69279
Furlough (*see under* Leave).

H

Hewlett, K., evidence of 69392-69421
Horsebreeding, transfer to Army Remount Department:
Department practically destroyed as Imperial, and hardship of 69394, p. 317-8, 69407
Less necessity for post of Inspector-General since, *Aitchison* 69345
Recruitment not greatly affected by, *Queripel* 69442

I

Imperial College, no justification for, at present, *Pease* 69271-2, 69277
Imperial Service:
Dissatisfaction among members, and causes, *Hewlett* 69400
no Grades ... ... p. 330, p. 336
High class of men recruited, but attractions not sufficient to keep them in Service, and increased pay necessary, *Queripel* ... 69431
RECRUITMENT OF INDIANS:
Advantages, *Queripel* 69436
no Applications received, *Queripel* ... 69428
Best class of recruit men who had been to England of their own accord and selected by Secretary of State, but promotion of certain number of officers from Provincial Service after training in England approved, *Hewlett* 69402
Diploma course in England advocated, *Queripel* 69444
Direct recruitment with English qualification would be best means, *Smith* 69290
English qualification should be insisted on, for officers recruited direct, but not necessary for promoted officers, *Hewlett* 69402
by Going through post-graduate course in England, inpracticability, *Queripel* 69428-9
Indians of sufficient training not likely to be forthcoming, veterinary work unpopular p. 329
Men having gone to England of own accord preferred, *Hewlett* 69419-21
Promotion from Provincial Service preferable to sending selected Indians to England, *Hewlett* 69419-26
Scheme for, in a few years' time, *Brand* 69311
Selection from Provincial Service preferable to direct recruitment, *Pease* 69258
Sending of selected Indian graduates to England, and recruitment to Imperial Service if qualified would be an advantage, but adoption of scheme not recommended, *Pease* 69277
after Training in England, as a rule, looked forward to, *Aitchison* 69342-69363
Relations with other services satisfactory, *Smith* 69287
Indians:
Best class would be attracted to veterinary profession only in exceptional cases, *Aitchison* 69349
Increased employment of, question of possibility, *Pease* 69256
no Limitations on employment of, *Smith*, 69286; *Brand*, 69316; *Aitchison*, 69339; *D'Silva*, 69360; *Hewlett*, 69398.

Indians—*continued.*
None on register of Royal College of Veterinary Surgeons, *Queripel* 69428
None at Royal Veterinary College at present, but one or two generally, no diploma obtained by, for past ten years, *M'Fadyean* 69454
None in service at present with English qualification of R.C.V.S., *Smith* 69291
Policy of Government of India *re* ... ... p. 335
no Religious objection to department, *Aitchison* 69353
Reservation of two or three posts of Superintendents for, suggestion, *Buxy* 69374, 69382
Staffing of department largely by, in future, looked forward to, *Hewlett* 69402
TRAINING IN ENGLAND:
Diploma course, appointments could not be guaranteed, but different openings for, *Queripel* 69444
Facilities to enable sons to go to England to obtain diploma of R.C.V.S., question of, *Pease* 69257
Post-graduate courses at Royal Veterinary College, difficulties, *M'Fadyean* 69455, 69456, 69459–60
State aid to exceptional students, proposal approved, *Buxy* 69380
Training in India, impossibility unless professors brought from England, *Queripel*... ... 69436

Inspector-General:
ABOLITION OF POST:
Appointment of senior superintendent as veterinary officer to Government would surmount difficulty of lack of technical head, *Aitchison* 69345, 69350
Diminution in number of candidates since, *Queripel* 69439
certain Disadvantages as result ... ... p. 329
Disadvantages of, *Pease* and *Farmer*, 69247; *Smith*, 69282, 69285, 69293–5, 60303, 69309; *Aitchison*, 69335; *Hewlett*, 69400; *Queripel*, 69441; p. 331.
Functions, *Hewlett* ... ... p. 317
Less necessity for, since Imperial horse-breeding handed over to Remount Department, *Aitchison* 69345
Post was an inducement to men to joint department, *Pease* and *Farmer* 69247
REVIVAL OF POST:
Argument that Inspector-General enabled one Department to know what was going on in another Province not agreed with, *Aitchison* 69352
Demand for, *Pease* 69259
not Necessary or desirable, *Hewlett* 69399, 69404

Inspectors:
Duties, *Brand* 69316
Number of posts in each grade, Bengal ... p. 330
PAY:
Rates and improvement advocated, Bengal, *Brand* ... ... 69313, 69321; p. 330
proposed Scale, *Buxy* 69372
RECRUITMENT:
Method ... ... p. 330
Scheme, *Brand* 69310–1, 69325
Selection from most able men, irrespective of seniority advocated, *Buxy* 69372

L

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

ON THE

PUBLIC SERVICES IN INDIA

RELATING TO THE

SURVEY OF INDIA DEPARTMENT,

At Delhi, Monday, 10th November, 1913.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

SIR VALENTINE CHIROL.
GOPAL KRISHNA GOKHALE, ESQ., C.I.E.
WALTER CULLEY MADGE, ESQ., C.I.E.
FRANK GEORGE SLY, ESQ., C.S.I.

And the following Assistant Commissioner:—

COLONEL C. T. F. B. RENNY-TAILYOUR, C.S.I., R.E., Superintendent, Southern Circle, Survey of India Department.

R. R. SCOTT, ESQ. (*Joint Secretary*).

LIEUTENANT-COLONEL G. P. LENOX-CONYNGHAM, R.E., Superintendent of the Trigonometrical Survey, Dehra Dun.

Written Statement relating to the Survey of India Department.

70044. **(I) Methods of Recruitment.**—(*a*) *Imperial Service.*—Officers are recruited from the Royal Engineers and the Indian Army in the proportion of three of the former to one of the latter. There is also one special officer designated "The Mathematical Adviser," who is appointed by the Secretary of State from time to time. The system of recruitment is satisfactory.

(*b*) *Provincial Service.*—Before entering upon any question concerning the Provincial Service it is necessary to point out that that of the Survey of India differs largely from the Provincial Service of the Public Works Department, with which it is often compared, and from some others. In those departments the Provincial Service has been formed in order to give to Indians and the domiciled European community, who are unable to send their sons to Europe, an opening into the more important branches of Government Service. Their Provincial Officers perform duties of the same kind as the Imperial Officers; their numbers are restricted to some moderate proportion of the whole; and the service does not form a link in the chain of organisation.

In the Survey of India the state of things is quite different. The Provincial Officers outnumber the Imperial Officers in the proportion of about three to one; the service constitutes a link in the chain of organisation intermediate between the Imperial Officers and the Surveyors; and in consequence, its duties are to a large extent of a different and less responsible nature than those of the Imperial Service. Moreover, the designation Provincial is quite inappropriate. All officers of the Survey of India (with the exception of the Mathematical Adviser) are liable for service in any part of India or Burma; they have no special connection with any particular locality.

The idea of creating Provincial Services originated, I believe, with the Public Service Commission of 1886, and it seems that in a desire for uniformity of nomenclature in all departments they recommended that what had till then been known as the "Junior Branch" of the Survey of India should receive the new designation.

The effect of this has been unsatisfactory. The change of designation naturally had no effect on the duties which the officers have to perform, but it has had the effect of gradually causing the officers to resent the fact that they are not on an equality in status and responsibility with similarly styled officers in the Public Works and some other departments, while they ignore the great difference between the qualifications demanded of them and of candidates for the Public Works Department.

In the latter candidates for the Provincial Service have to spend three or four years at an Engineering College at their own expense, and after that to take their chance of obtaining an appointment.

Candidates for the Provincial Service of the Survey of India are only required to produce a certificate of having passed the First Arts, or Final School Examination and are then admitted to an elementary competitive examination managed by the department itself. The successful candidates after joining the department are placed under instruction for about a year during which time they receive a salary of Rs. 100 per mensem.

In 1909 a New Provincial Service, with higher pay than the old one, was created, and it was hoped that a more highly educated class of candidate could be attracted. The attempt was not successful, and in consequence of the great and not unnatural discontent aroused in members of the old service by seeing men in no way their superiors given much better terms, it has been found necessary to raise the pay of the old up to that of the new, with the result that the majority of the officers of the old service are now in the enjoyment of very much higher emoluments than they could look forward to when they joined, and it is undeniable that for the pay and prospects now offered Government would have a right to ask for a higher standard of education.

But it is questionable whether it is advisable to take any steps in this direction. At present the Department contains four different classes of officers, namely, Imperial, Provincial, Upper Subordinate, and Lower Subordinate. But there is scarcely room for more than three, namely, Controlling Officers, Supervising Officers and Surveyors. Before 1895 there were only three classes, the Senior Branch, the Junior Branch and the Surveyors; after that there were the Imperial Service, the Provincial Service and the Surveyors: but in 1909 it was decided that the Provincial Service was too expensive an agency for supervising duties, and it was ordered that its numbers should be reduced by degrees from 134 to 87 and that an Upper Subordinate Service should be formed which would in part replace it. The device does not promise to be successful. There is no dividing line between the duties of the two Services. It would be better to have one Service only, modelled on the Upper Subordinate Service of the Public Works Department, which would include a good proportion of non-commissioned officers of the Royal Engineers and other corps, who have been through a course of training at the Thomason Engineering College at Rurki.

I have already mentioned that it was ordered in 1909 that the strength of the Provincial Service should be reduced from 134 to 87. By a more recent order recruiting has been stopped.

The best policy to pursue would seem to be to allow the present Provincial Service to die out and replace it by such a Service as I have mentioned above. This would involve no hardship or injustice to existing members of the Provincial Service, and would provide a body of men who would, I believe, be particularly well adapted to the work of the Survey. Men of this class have proved very useful in the Public Works Department and Military Works Service, and their training and qualities would render them even more suitable for employment in the Survey, in which there is a considerable and increasing number of soldier surveyors recruited from Native regiments. For work in connection with Military operations a survey party consisting of trained soldier surveyors, supervised by non-commissioned officers who had received a technical education at Roorkee, and controlled by an Imperial Officer, would appear to be extremely suitable. I do not mean that the new Upper Subordinate Service should be wholly military; it would probably be advantageous to have a good proportion of Indians and of domiciled Europeans, but for such the education test should be made tolerably stiff, it being recognised that those who had not the advantage of Military training should be possessed of some other valuable quality.

70045. **(II) System of Training and Probation.**—(*a*) *Imperial Service.*—Officers of the Royal Engineers receive a good training at the School of Military Engineering, and all that they require is some instruction in the methods that have been found best for this country and in the use of instruments of high precision.

Officers of the Indian Army require a good deal more teaching. After a period of instruction they are required to pass an examination and to serve on probation for a time before they are finally admitted to the Department. No change in the present arrangements seems necessary.

(*b*) *Provincial Service.*—These officers receive a year's training when they join and are on probation for two years after that.

No change in the system seems necessary.

70046. **(III) and (IV) Conditions of Service and Salary.**—No remarks.

70047. **(V) Conditions of Leave.**—(*a*) *Imperial Service.*—The amount of leave is adequate, but the grant of it is hedged about by some restrictions which do not seem to me to be useful and which are sometimes vexatious; also the rules are so complicated as often to be difficult to interpret. I think greater simplicity should be aimed at. At present 11 months of duty earn one month of leave on full pay, and four years of duty earn one year on half pay. Retaining these amounts, if leave were treated like money, and an account like a banking account were kept, showing the amounts earned and the amounts taken, I do not think any restrictions would have to be made except that there would be a limit to the amount of leave to be taken at one time (sickness excepted) and that no leave could be given unless the exigencies of the Service permitted it, which would impose a limit on the number of officers on leave simultaneously. The rule that an officer cannot have furlough until he has done eight years' service is frequently a source of hardship and is of little if any benefit to the State.

(*b*) *Provincial Service.*—The leave rule applying to this Service might also be simplified with advantage.

There is one other remark to make on this subject. Officers appointed by the Secretary of State to such appointments as those of Manager or Assistant Manager in the technical offices of the Survey of India, find themselves under the Indian Leave Rules. This is a hardship. These rules are framed to meet the case of men who are either natives of or domiciled in this country and to whom a visit to Europe is an exceptional thing. When applied to men who are wholly English they are unsuitable as they do not allow them sufficient opportunities for going home. If such men can manage to afford to go home from time to time both they and the Service benefit, and it is both unwise and ungenerous to place obstacles in their way.

70048. **(VI) Conditions of Pension.**—No remarks.

70049. **(VII$_A$) Such limitations as may exist in the employment of non-Europeans.**—(*a*) *Imperial Service.*—This is a Military Service, and the question does not arise.

(*b*) *Provincial Service.*—So far as I am aware, there are no limitations to the employment of non-Europeans.

70050. **(VII$_B$) The working of the existing system of divisions of Services into Imperial and Provincial.**—As I have explained above, the term Provincial Service is unsuitable to the conditions of the Survey of India. The old term of "Junior Branch" was more appropriate, indicating as it does that the officers of that Branch had less responsible duties than those of the Imperial Service, or as it was then called the Senior Branch.

There is no need for any Provincial Service in the Survey of India, but there is a need of a body of men to undertake the more difficult parts of a Survey, and to be intermediaries between the

Imperial Officers and the Surveyors, to check the field-work, allot tasks and generally supervise detail. As I have stated under the head of recruitment I believe that such a Service could be formed by the enlistment of Non-Commissioned Officers of Royal Engineers and other corps supplemented by suitably educated Indians and domiciled Europeans.

70051. **(VIII) Relations of the Service with the Indian Civil Service and other Services.**—The relations between the Survey of India and other Services have generally been good and satisfactory.

Lieutenant-Colonel G. P. Lenox-Conyngham called and examined.

70052. (*Chairman.*) The witness said he had occupied his present position for 13 months. He had served in the Survey Department from July, 1889. There were three classes of officers in the Imperial Branch of the Service, Superintendents, Deputy Superintendents and Assistant Superintendents. The Superintendents were in charge of circles. Each circle was composed of four parties doing topographical survey, each party being in charge of a Deputy Superintendent. One Assistant Superintendent should be with each topographical party, but at the present time there was not a sufficient number to provide for one being with each party. The duty of an Extra Assistant in the Provincial Service was normally to take charge of a camp, or of a sub-division of a party. The Assistants in the two branches of the Service were not ordinarily employed on the same kind of work. An Assistant in the Imperial Service acted as adjutant to the officer in charge of the party, whereas the Extra Assistant of the Provincial Service would be in charge of a camp, supervising the surveyors and checking their actual work on the ground. The assistant in the Imperial Service would either act in lieu of the officer in charge of the party, or take over his duties, or assist him in carrying out the duty of control, while the Extra Assistant in the Provincial Service would simply supervise the work of the surveyor. Under a very recent re-organisation, seven major charges had been made over to the Provincial Service, and Provincial Officers holding such posts were doing practically the work of the officers in the Imperial Service, the only difference being in the status and pay.

70053. Dealing with the suggestion contained in the written statements which had been put before the Committee, that recruitment in the Imperial Service should be confined to Royal Engineer officers, or alternatively, that posts now reserved for Indian Army Officers should be open to other branches of the Military Service, witness said he should be in favour of the former proposal, because a Royal Engineer was better trained for the purpose. He received a good training at Woolwich and Chatham, and came to India already equipped for the work of a surveyor. Then, there was no prejudice against a Royal Engineer taking up such an appointment. In the Indian Army there was a distinct tendency to prevent the best men from leaving their regiments; Commanding Officers did not like their best men leaving to fill a departmental appointment. Again, the disparity between an officer of the Indian Army and the pick of the Royal Engineers was considerable. Also, apart from the fact of that disparity, an officer from the Indian Army entered the Service quite untrained. There was not a large field of selection for officers from the Indian Army. It was extremely difficult to discover whether such officers had special capacity for the work of surveying. The present method of selection was a recommendation by the Commanding Officer, which came before the Surveyor-General, who had to find out what he could about the men, and this was not a very easy task; there was no intrinsic qualification to go upon. With regard to the suggestion that a system might be devised for sending an Indian Army Officer for a year's training in the survey, the object being to provide a nucleus from which permanent appointments could be made, witness said he would not care to give an opinion without consideration. Some organisation would have to be made for such officers' training, which was not at present in existence.

70054. The present system of training was as follows: Men were generally sent to the Trigonometrical Survey Office, where they obtained some training in the scientific and mathematical branches of the subject from the mathematical adviser. They were attached to a field party, and picked up such information as they could. There was no very good organisation. Appointments were so few that the Department had to manage in that way. A more complete organisation and training could not be undertaken unless there were more men to train. At present the proportion was three engineers to one Indian Army Officer. An appointment from the Indian Army was only made once in two or three years. It would not be fair to say that a man's training during his probationary period was somewhat of a perfunctory character. The training was carried out with some little difficulty and inconvenience to other people, but he thought an officer obtained a satisfactory training. Full attention was paid to him. He did not think it necessary that Royal Engineer Officers should pass an entrance examination for admission to the survey of India. They had been through a good many examinations in England, which he thought were quite sufficient. He should be inclined to think that a longer period of training for an officer in the Indian Army would be of benefit, and he suggested three years. At the end of the present two years' probation, there was still a disparity in an Indian Army officer's knowledge as compared with that of a Royal Engineer's.

70055. With regard to the question whether the rules for admission to the Provincial Service had proved on the whole satisfactory, the witness said it was difficult to say whether the Department had obtained as good men as it might have done by some other system. Of the three methods of entrance into the Service put forward in 1909, the system of competitive examination was practically the only one to which effect had been given. Very few promotions from the Subordinate Service had been made in the past, and none recently. On the average the promotions from the Subordinate Service had proved satisfactory, but there was not a great number of such cases on which to base an average. Personally, he could think of only two. Under the rules for admission to the Provincial Service it had been ordered that at least one-fourth should be Indians, and it was understood that in the Upper Subordinate Service it was the intention to give at least half the vacancies to Indians. In practice, no applications had been received except from Indians.

70056. He had not a very good knowledge of how Survey Officers were recruited in other countries, but he thought in all cases, with the exception of the United States, the Survey Department was under a Military organisation. It was necessary to have a reserve of Royal Engineer officers in India and these officers were employed in times of peace on such work as the Survey. He did not know of any Civilian Survey Officers who had been employed on Military expeditions.

70057. He thought the Provincial Service was "a fifth wheel in the coach," and should therefore be abolished. The duties of the Department should be divided under three heads—controlling, supervising and actual surveying, with the surveyors supervised by a superior service, and directed by the Imperial Service. The three classes should be entirely separate. Prior to 1895 the Service was divided into senior and junior, and when the designation of "Provincial" was adopted, the duties did not change in any degree. The Service was an all-India Service, and therefore he thought "Provincial Service" was a misapplication of terms; it did not in the least express the nature of the Service. The Imperial Service, as he would like to see it, would be confined to officers

in charge of parties, and their assistants in training under them. The Upper Subordinate Service would be composed of officers employed in definitely inferior work. If the Provincial Service was abolished and the Upper Subordinate Service took its place, the designations of officers would doubtless be somewhat different.

70058. He thought Circle Superintendents were really necessary to act as a link between the Surveyor-General and the field parties. It would be bad organisation for the Surveyor-General to try and keep in touch with the whole 18 or 20 parties. A Circle Superintendent had five parties under him, and his duty was to be in constant touch with them. The Deputy Superintendents in charge of parties communicated with the Surveyor-General through the Circle Superintendent. He thought that after one year's training a Royal Engineer Officer would be quite competent to take charge of a camp, and that after four years' experience he could be entrusted with charge of a party. He would suggest a longer period in the case of an officer from the Indian Army, but he would be adverse to laying down any hard-and-fast rule, because men differed. He thought the period of probation in the Provincial Service was sufficient. They did in practice go through a three years' probation. With regard to the complaint that officers, particularly Provincial officers, did not obtain a sufficiently varied training during their first year's course, the witness said that when the Department was up to its full strength and less pressed with urgent work, it could arrange to give men a sufficient experience; but in the past the Department had been shorthanded, and a man had to be put to the work which he could do. He thought, however, that nearly all officers were agreed that, so far as possible, a man's experience should be varied during the first years of his service. That very largely depended upon the sufficiency of officers. There was an insufficiency at the present time when any sudden emergency arose. For instance, last year there was an expedition to the extreme north-east frontier, on which nine officers were engaged, and this made a considerable difference to a Department composed of 54 officers. He thought an increased reserve would be a good thing.

70059. With regard to salary, he considered the present system of pay an extremely inconvenient one. It led to a good deal of administrative trouble. He would prefer to see the time scale so adjusted as to include the charge allowance.

70060. Dealing with the representation that the pay of Provincial officers was much less than two-thirds of the pay granted to Imperial officers, and that it should approximate more nearly to the rates authorised for Provincial officers in other services, the witness replied that a Provincial Service which was created in order to give to the people of India an opportunity of obtaining some of the higher appointments under Government was organised on different lines from the Provincial Service of the Survey Department, which was distinctly intended to be a link in a chain of organisation, and was not intended to be on a par with the Imperial Service. When the Provincial Service was created, the duties allotted to officers were not changed in any way; it was still the Service which was originally called the Subordinate Service. It was re-named the Junior Branch, and then the Provincial Service, but the duties remained precisely the same. He did not think the two-thirds scale of pay applied at all. The Provincial Service of the Survey Department outnumbered the Imperial Service by about two and a half to one, so the suggested increase in pay would be a formidable item. With regard to the suggestion that for the Provincial Service an annual increment of Rs. 20 should be substituted for the present triennial increment of Rs. 50, the witness replied it was a question of what the Government desired to give.

70061. With regard to leave, the witness said he had heard in conversation that there was a considerable consensus of opinion in favour of an officer being allowed to accumulate privilege leave for more than three months. Sometimes a man had accumulated his three months' privilege leave, which took him 33 months, and then it was found that he could not be spared. Then from the moment he had 33 months' service to his credit, he ceased to be able to accumulate more privilege leave. The witness thought that perhaps it would be advisable only to allow the privilege leave to exceed three months in cases where the officer was unable, owing to the exigencies of the Service, to obtain it when it was due to him. He did not see any special advantage in granting officers leave to study the methods of the Survey Department in other countries. The methods which had been adopted in a country like England were so different from those adopted in India that he did not think officers would learn anything of value. It would be an advantage for a certain number of officers to be allowed to study the scientific branches of survey, such as gravity observations, magnetic observations, and so on. He thought it would repay the Government of India to encourage officers to study those branches during leave.

70062. With regard to pension he thought the present period of 30 years' qualifying service might be reduced. The life of a Survey officer was a very hard one. He thought that it would be a good thing to allow officers to join the General Provident Fund, and he should say that a concession of this nature would be acceptable.

70063. Replying to a question whether, if the scheme he had suggested of only having two divisions, the Imperial and the Upper and Lower Subordinate ranks, was adopted, he would give opportunities to the qualified and more efficient officers in the Upper Subordinate Service to be promoted into the Imperial Service, witness said he did not think there should be an absolute bar, and yet he did not think it was a plan which would work well, except in very exceptional cases. He did not think promotion should be given as a mere reward for long and meritorious service, but that exceptional ability should be taken into account. Of the two alternatives, promotion of a qualified officer from the Upper Subordinate Service, assuming that the qualification for appointment to the Service was higher than it was at present, or of direct recruitment with a proper training for an Indian, he would favour direct recruitment with a proper training, which he thought should certainly include a certain time spent in England, but he would prefer to see neither scheme adopted. He might remark that it was not very easy to get a proper topographical training in England. The only satisfactory school of training that he knew of was the School of Military Engineering at Chatham, to which Civilians were not admitted.

70064. (*Mr. Gokhale.*) The witness said he did not think the Provincial Service in the Survey Department was the same as the Provincial Service elsewhere. He thought the term "Provincial" as applied to the Department was a misnomer. He had not considered the question of the starting salary for the Upper Subordinate Service, supposing his scheme for the abolition of the Provincial Service was adopted, but he should say it would be very similar to the starting salary of the Upper Subordinate Service of the Public Works and Military Works Department. It would be true, therefore, to say, that if the Survey Provincial Department was replaced by an Upper Subordinate Service, there would be a considerable saving effected. He thought a satisfactory class of men for Survey Work would be obtained on that grade of salary, taking into account the experience of the Public Works and Military Works Department. He would withdraw from the Provincial Service the seven Executive charges which had been transferred to it, and he would also have in his proposed Upper Subordinate Service a considerable proportion of non-commissioned officers. The proportion he had in mind was two-thirds. It would be the case that if his scheme was adopted, the entire Provincial Service with its higher emoluments would be lost to Indians and domiciled Europeans and Anglo-Indians. He agreed that he was not improving the Survey Department from the standpoint of domiciled Europeans, Anglo-Indians and

Indians by his proposed scheme. He was simply looking at the matter from the point of view of efficiency, and that the outturn of the Department should bear a satisfactory proportion to its cost. The reason why the cadre of the Imperial Service had risen from 40 in 1895 to 55 in 1910 was on account of the recommendations of the Committee which sat in 1904-05. At that time the whole of India had been surveyed after a fashion, but many of the maps were old and inaccurate and the Committee recommended that a systematic re-survey should be undertaken. The estimate of how long the present survey would take was put at 25 years, but he thought that estimate was optimistic. He did not think after the present survey had been finished it would lead to a contraction of the staff of the Surveying Department, if one judged by the experience of other countries. Larger scales and more detailed surveys were constantly being called for as civilisation advanced.

70065. (*Mr. Sly.*) Witness said he did not believe the Indian Army Officers in the Survey Department formed a portion of the War Reserve. They were not required to pass a military examination for promotion, as was the case with Royal Engineer Officers. The duties of the Survey Department in time of war would be to take over all matters connected with the producing of maps for the use of the troops, but doubtless there would be some officers of the Survey Department who would return to their normal Military employment, and become field engineers with the troops. Apart from the War Reserve, however, the survey party, as such, would be furnished by the Survey Department, and employed in time of war as a survey party.

70066. It was not a fact that of the seven charges which had been transferred to the Provincial Service, three had been definitely allocated as office charges. The total number of charges in the Survey Department had, he believed, in the past exceeded 20, but he could not answer that question definitely until he had seen the records.

70067. With regard to opening the Provident Fund for Imperial Officers in the Survey Department, he did not think that preferential treatment should be accorded to any particular department in this respect, but he had not considered the question thoroughly. At the present time no Army Officer in any Department, either Military or Civil, was entitled to subscribe to a Provident Fund, but members of the Provincial Service of the Survey Department did subscribe to a General Provident Fund.

70068. (*Mr. Madge.*) When a qualified Provincial Officer was promoted, his normal duty was to take charge of a camp. If he was selected for an executive charge, he had charge of a party. He did not think a Provincial Officer could rise to the charge of a circle, but he pointed out that the circles had only been in existence for about three years. Referring to the recent order providing for the promotion of Provincial Officers to higher positions, he agreed that this was only a restoration of a privilege previously enjoyed by Provincial Officers, of which they had been deprived by an intermediate committee. But the circumstances were somewhat different. Before the intermediate committee sat, there were no charge allowances, and anybody could be put in charge of a party if he was conveniently placed at the moment the post fell vacant. As far as the pay was concerned, no special sanction was required. No doubt personal qualifications would be taken into account in such cases, as well as considerations of temporary convenience.

70069. Only the Superintendents of Circles were administrative officers. Officers in charge of parties were certainly Executive Officers, but Provincial Officers in charge of camps merely had to check the actual work on the ground, and to do the actual measurements. That was not done, except occasionally, by the officer in charge of the party. There had been two officers known as Deputy Surveyor Generals with administrative duties. Such a post had been held by an uncovenanted man, Mr. Hennessy, who had taken a very high degree at Cambridge. How he had been recruited, and what his career was the witness did not know. He supposed an Assistant Surveyor General would be in administrative charge, and he knew of one case of such a post being filled by a man who had been educated entirely in India.

70070. With regard to study leave, there was no great difference between the training obtainable in India and that obtainable in England. The practice of surveying was different in India, but the principles were the same the world over.

70071. He did not see why there should be any barrier to the promotion of any man in any service for any post, provided he possessed the practical experience and the necessary qualifications. His whole object in making the suggestion with regard to recruitment of non-commissioned officers, was to arrange for an organisation, which, in his opinion, would work easily and efficiently. He thought trained non-commissioned officers, especially from the Royal Engineers, would go to form an efficient, well disciplined department. He agreed that men recruited in India might come from a higher social rank and be better educated men than privates in the Army.

70072. (*Sir Valentine Chirol.*) The witness said he did not join the Department direct from Chatham. The normal employment of a Royal Engineer was in the Military Works Service. He was in that Service for about 18 months when he was appointed to the Survey Department. That was the general method of recruitment for the Survey Department. He agreed that there was no corps in the Indian Army which was analogous to the Royal Engineers, so that, regarding the survey work as essentially military work, the only source of recruitment was the corps of Royal Engineers, and the only training obtainable was through Woolwich and Chatham. The competitive examination for the Provincial Survey Service in India consisted of four mathematical papers, Arithmetic, Algebra, Geometry, and Trigonometry, some geometrical drawing, and some freehand drawing. At various times the syllabus had included an English essay, but latterly this subject of examination had been abolished. He thought he would have been able to pass such an examination two years before he left school, when he was about 14 or 15 years old. The examination did not reach anything like the standard of the Entrance examination for Woolwich. His opinion was that Provincial officers who were promoted to hold major executive charges did not really possess the qualifications which, in his opinion, they should possess.

70073. (*Mr. Gokhale.*) Some of the Provincial Service men were graduates of Indian Universities, and he thought if good graduates of Indian Universities competed the standard of education of the Provincial officer would be satisfactory. It seemed to be very difficult, however, to obtain good graduates from Indian Universities to compete for entrance to a Provincial Service, in which the starting salary was Rs. 250. He did not think the life of a surveyor was attractive to the well-educated Indian. He was not prepared to say that Indians, even with high educational qualifications, would be in every respect as efficient and satisfactory as the Imperial officer, who had had his Military training and possessed other qualifications.

70074. (*Sir Valentine Chirol.*) No scientific degree of an Indian University would correspond, or be a substitute for the particular training obtained at Woolwich and Chatham. A training similar to that given at Chatham could, he thought, be supplied by the Department itself if a man had a sufficient educational foundation.

70075. (*Chairman.*) He would prefer to send a man to an institution in England to receive the training, rather than that the Department should give it, as the instruction in the Department had to be given rather informally.

70076. (*Colonel Renny-Tailyour.*) The witness said that a training in survey work was given at Sandhurst as well as at Chatham and Woolwich.

(The witness withdrew.)

CAPTAIN A. H. GWYN, I.A., Assistant Superintendent, Survey of India Department.

Written Statement relating to the Survey of India Department.

70077. **(I) Methods of Recruitment.**—The system of recruitment of Indian Army Officers might be modified. At present these officers are, I believe, chosen by the Surveyor General from a very small list of applicants. The Surveyor General can generally have only a rather scanty acquaintance with these applicants, who, moreover, on joining the Department, must be trained for a considerable time before they are of much use.

The Surveyor General could now begin to build up, in order to choose from as vacancies occur, a small body of Indian Army officers in military employ who would all have worked in a Topographical Party, and of whom the Survey would have first-hand knowledge.

At the same time the Army in India would benefit by having a number of officers really well grounded in Topographical surveying, because the great majority of them would remain in military employ, only a very small number being appropriated by the Survey of India. I would suggest an arrangement something like the following:—Each year the Commander-in-Chief and the Surveyor General together to choose from the Indian Army two young officers of about 2½ years' service. These men would remain in military employ, but would come to us for training for about a year. Joining in the autumn, they would plane-table throughout the field season with a topographical party, work in the party office for half of the following recess, and then revert to their ordinary military duty, without any claim to future employment in the Survey of India, or to any particular grading in that department if subsequently admitted. I think good men would come on their military pay (Rs. 400 almost exactly at 2—4 years' service), and on military allowances of some sort which would approximate to those of a junior Imperial Assistant Superintendent; because of the inducement that (as things are at present) one man in about eight so trained would at some future time be appointed to the Survey.

The pay and allowances of each man for, say, six months in the field and three months in recess, would be about Rs. 5,000; say for two men Rs. 10,000 annually; the Army ought to pay for them, as most of the training imparted by us would go to the Army again, and never return to us.

The Surveyor-General to retain his power of nomination, and not to be tied by the five-years-service rule.

I think two is the lowest useful number we could take annually; if we are to have a good number of *umedwars* to pick from.

A nine months' course of training is the least, I think, that would suffice both to give us a proper knowledge of the comparative values of the officers, most of whom would come to us knowing little, and to make them useful to the Army. On joining as an Assistant Superintendent in the Survey of India, of course, a man's survey training would have to be completed.

70078. **(II) System of Training on Probation.**—As I personally remember the Dehra Dun topographical training, it seems to me to be too free from difficulties, and that it would be as well for a young officer to receive it in the field with a topo. party, of which, besides, he should soon become a useful member. I also think that part of the training period should be spent in Calcutta, looking through the accounts system and the drawing and reproduction offices; Dehra Dun would still have to deal with a man's mathematics and all field surveying except topography.

70079. **(III) Conditions of Service.**—Indian Army officers might be given facilities for undergoing military tests for promotion, and be more often sent on field service as survey officers.

70080. **(V) Conditions of Leave.**—I personally would like to be able to take less than six months' combined leave. Three months' privilege leave is perhaps enough short leave for anyone going to England, but it is a scramble to make it cover leave in Canada.

70081. **(VI) Conditions of Pension.**—The ordinary Indian Army pension of £700 after 32 years' service ought, I think, to be augmented by £100 for Survey of India Officers; they spend less of their service on leave, and their work is more laborious and better paid than that of officers in Military employ. At the least, an officer should be allowed the choice between the Military pension allowable and that to which a "half average salary" rule would give him.

7082. **(IX) Any other points not covered by preceding heads.**—I think the Imperial Assistant Superintendent at Headquarters ought to get Rs. 100 local allowance to cover the great expense of living in Calcutta. If married, he gets nothing extra, whereas the Imperial Deputy Superintendents get Rs. 100 local allowance on top of these Rs. 200 charge allowance (though not for expensive living I admit).

CAPTAIN A. H. GWYN called and examined.

70083. (*Chairman.*) The witness said he had had about five years' service in the Department and had served about six years in the Army before joining the Survey Department. He had spent the whole of the 11 years in India. He was not satisfied with the method of selection for the officers of the Indian Army, and thought the list of applicants was a small one. Officers in regiments of the Indian Army were not aware that the Survey Department was open to them. About one-fourth of the officers now in the Department were officers of the Indian Army. He would like to see two young officers, chosen from the Indian Army, of about two and a half years' service enter the Survey Department on probation. They should have no claim to enter the Survey at the end of that time, but should return to their regiments with the opportunity of being subsequently recruited to the Service. His particular object in putting forward such a scheme was that there was a dearth of officers in India with surveying knowledge. Another object of his scheme was to give the Survey Department a list of people to choose from. The Indian Army authorities could, he thought, easily spare two officers annually for such a purpose.

70084. He thought the present period of probation sufficient He considered the Dehra Dun course was too easy, in that there was not enough supervision; students were allowed to go their own way. The usual course there was supposed to be for a year. He did not know whether it still continued. With regard to his remark in the written statement that Indian Army officers might be given facilities for undergoing Military tests for promotion, and be more often sent out on field service with survey officers, the witness said it had got to be the custom in the Survey Department to look upon an Indian Army man as not a Military man at all. He thought Indian Army officers would be glad to pass the promotion examination. An Indian officer felt himself under a disability as compared to the officers of the Royal Engineers, and he would like to see the same opportunities extended to the Indian Army officer.

70085. He did not mean by his recommendation for an additional pension of £100 that the present conditions of the Service in regard to pension were

not sufficiently favourable to attract suitable officers. It would be an added attraction. Those officers of the Indian Army who had heard of the Survey Department looked upon it as a well paid Service.

70086. (*Mr. Madge.*) He knew of no special method by which regiments in the Indian Army could be apprised of the fact that the Survey Department was open to them, except that stated in the first paragraph of his written statement.

70087. (*Mr. Sly.*) He considered it necessary to maintain recruitment from the Indian Army, because the Indian Army was an Indian Service and belonged to India; the Indian Army provided a wide field of selection; an Indian Army man who had served three or four years in his native regiment would know more intimately the workings of the mind of an ordinary Surveyor; and Indian Army Commissioners are nowadays taken by those cadets who pass highest out of Sandhurst.

70088. He thought the Imperial Assistant Superintendent at headquarters in Calcutta ought to get a local allowance.

(The witness withdrew.)

A. Ewing, Esq., Deputy Superintendent, Survey of India Department.

Written Statement relating to the Survey of India Department.

70089. **(I) Method of Recruitment.**—Since the Resolution of the 27th March, 1895, separating the Survey of India Department (then comprising a Senior and a Junior Division) into an Imperial and a Provincial Service, the Imperial Service has been recruited chiefly from officers of the Royal Engineer Corps, who are appointed to the Survey Department by the Government of India on the recommendations of the Surveyor General of India.

Members of the Provincial Service are appointed to the Department after passing a competitive examination among candidates who are nominated by the Surveyor General of India.

These methods of recruitment I consider satisfactory, but would like the standard of the physical fitness of the Provincial Service to be raised, as survey work in India is done under very trying climatic conditions.

70090. **(II) System of Training and Probation.**—The candidate for the Provincial Service on passing the competitive examination is appointed to the Department on probation for three years, during which he is liable to be discharged at any time should his conduct or progress in survey work be unsatisfactory. During his first year of probation he attends a survey training class and is taught the theory and practice of surveying and map drawing, and the use of the various surveying and drawing instruments. A portion of this year is spent in the field. During the next two years he is attached to a survey party for further practical training in surveying and map-drawing. On the termination of his period of probation a report is submitted by the officer in charge of the party under whom the probationer has worked, and if the report is satisfactory he is confirmed in the Department by the Surveyor General.

In my opinion, this period of training is quite insufficient to make a Provincial Officer thoroughly qualified to undertake the responsibilities in training Indian Surveyors and in supervising their work, and that greater facilities should be offered to the members of the Provincial Service who may wish to improve themselves, and I therefore respectfully suggest that:—

(*i*) A small amount be deducted every month from the salary of each Provincial Officer, and after eight or ten years the accumulated sum with the usual interest be spent on his passage to Europe or America to enable the Provincial Officer to study the methods of surveying and map-drawing of other nations, the Government of India granting each individual three or six months' study leave on full pay, and, if necessary, small advances recoverable by easy instalments. The small extra expenditure on the part of the Government of India in granting every year two or three of their servants full pay instead of half pay would be more than counterbalanced in their having a highly trained and efficient Provincial Service.

(*ii*) Provincial Officers, when young, be transferred more frequently from one party to another and also from one circle to another, so as to gain the required experience which is essential in the Survey Department.

70091. **(III) Conditions of Service.** — Every member of the Provincial Service on appointment to the Survey Department has to sign an agreement that he is willing to serve Government in any part of India or Burma, and that if he resigns before three years he has to refund the total amount drawn as salary. These conditions should be maintained.

70092. **(IV) Conditions of Salary.**—The salaries of the members of the Provincial Service, with the exception of the probationers, who are paid while being trained, I do not consider adequate for the duties performed. The Public Service Commission of 1886-87 laid down a general principle that the Provincial Services should be paid at a reduction of one-third in the scale of pay of the Imperial Service. This principle has been departed from in the Survey Department, and also the time-scale as recently sanctioned by the Secretary of State is not so favourable as granted to other Provincial Services.

Owing to the enhanced cost of living in India, the married members of the Provincial Service in the lower grades can just exist on their salaries after taxes and subscriptions to funds have been deducted. It is true that the first 10 members of the Provincial Service are paid from Rs. 650 to Rs. 800, with Rs. 100 and Rs. 200 for allowances. But few can hope to be promoted to these grades and to draw these salaries for any length of time. I do not consider that the salaries in the higher grades sufficiently compensate a Provincial Officer for over 25 years of hard work in the Survey Department. I therefore respectfully suggest that the first 15 members of the Provincial Service be paid from Rs. 700 to 1,250.

70093. **(V) Conditions of Leave.**—The amount of leave granted by the Government of India to the Provincial Service I consider liberal, but I would suggest the addition of a year's study leave, for the reasons given under No. 2 system of training and probation.

70094. **(VI) Conditions of Pension.**—The present maximum pension of Rs. 416-10-8 per mensem is, I think, liberal; but as every member of the Provincial Service cannot hope, under the present condition of pay and promotion, to reach the higher grades of the service within three years of his being superannuated, and so be eligible for the maximum pension, I consider that the salaries and the number of appointments in the higher grades should be raised, to ensure that Provincial Officers after 30 years' service may be able to retire on a pension of Rs. 416-10-8.

70095. **(VII) The working of the existing system of the Services into Imperial and Provincial.**—The formation of an Imperial Service for the administration of the Survey Department and to provide a reserve of Royal Engineers in case of war is sound policy. But, the number—viz., 55—in that service is not only out of all proportion to the requirements of the Department, but it also has an injurious effect on the other services of the Department. Previous to the Resolution of 5th April, 1910, on the recommendation of the Survey Committee of 1904-5 the number in the Imperial Service was fixed at 42. Since then, although the

number and strength of parties have been reduced, the Service has been increased by 13. The Department, at present, is over-officered and undermanned, and this unnecessary increase has been made at the cost of out-turn of work. I therefore consider that the Imperial Service should be gradually reduced to 40 and the lower subordinate service and menials be increased in number and their pay and prospects bettered from the savings thus effected.

Mr. A. Ewing called and examined.

70096. (*Chairman.*) Witness said he had seen 32 years' service. He was recruited to the old junior branch. He obtained entry to the Service by passing a qualifying examination, which was equivalent to the Indian First Arts. When he joined there was a junior and a senior division, so that when the Provincial Service was established, he found himself graded as a Provincial Officer. His duty as a Deputy Superintendent was to be in charge of a party. He did exactly the same work as that discharged by an officer in charge of a party in the Imperial Service. There were 12 parties in the Survey Department doing topographical work, and their duties did not vary a great deal in regard to difficulty and responsibility. Of those twelve parties, four were under the charge of Provincial officers, and were each, in their own way, major positions. He suggested that the number of Imperial officers should be reduced to 40, as at present there were too many Imperial officers for the requirements of the Service. At present there were about 26 higher appointments for which there were 55 Imperial officers. In his opinion there should not be more than one Imperial officer to each party. The second Imperial officer at present attached to a party did practically the work of a Provincial officer. He agreed that such an officer was being trained for the higher positions, but after three or four years no further training was required. Asked how would he provide for an adequate supply of young officers in training for the higher positions if the Imperial Service was reduced to the extent he suggested, the witness replied there would always be seven or eight men under training and this would be quite sufficient for the requirements of the Department. He was only dealing with the requirements of the Department, and not with the reserve which was required for war purposes.

70097. He thought officers should be removed from one circle to another during their early service for two or three years. He did not think this would dislocate the work. Officers arriving in a new district would probably fall into the new régime in a few months.

70098. With regard to the training of a Provincial officer, he did not think that a period of three years' training was sufficient, and he would like to see facilities for study leave in Europe. He suggested that a certain sum should be deducted every month from the salary of a Provincial officer, so that at the end of his eighth or ninth year, he could make the journey to England. By such means he would gain a varied knowledge, and probably pick up new ideas and become better qualified. He thought that after such a training, a man would be qualified to take charge of a party. He would like to see a fixed number of Provincial officers promoted to major charges. He would not favour any proposal for the abolition of the Provincial Service in the Survey Department, but would prefer to see the Service retained in its present position. In his judgment it was the only practical way of carrying on the work.

70099. With regard to salary, he recommended that the first 15 members of the Provincial Service should be on a scale rising to Rs. 1,250. His justification for that suggestion was that there was a very slight prospect of men getting to the higher grades, and there was therefore no inducement for a man to work hard. He did not think there was any difficulty in obtaining a good class of Provincial officers. Although the Survey Department was not so popular as other Departments there was no dearth of well qualified men.

70100. The system of entrance to the Provincial Service was as follows. A certain number of candidates were nominated. They then had to pass a competitive examination. There was a certain amount of selection amongst those who were nominated. A native of India who had passed high in the list obtained one of the appointments, but if there were more natives of India at the top of the list than were required to fill one-fourth of the vacancies, successful Indian candidates would be shut out. He should say that such a system would cause dissatisfaction, but he had not come across any. His recommendation that salaries should be so adjusted as to ensure that officers would get a pension of Rs. 5,000 after 30 years' service meant in effect increasing the maximum of the present time-scale from Rs. 600 to Rs. 850.

70101. With regard to his suggestion that the Service was over-officered and undermanned, he did not mean to say that topographical survey work was inefficiently performed owing to the party being undermanned; he simply meant that it was undermanned in proportion to the officers in the party. He thought there should be one Imperial officer where at present there were two.

70102. (*Sir Valentine Chirol.*) His proposal that the number of Imperial officers should be reduced would allow for the withdrawal of the nine Imperial officers who were attached last year to work on the North-East frontier. For temporary purposes the Provincial men could take charge of a party.

70103. (*Mr. Madge.*) The reason why there were two Imperial officers in charge of a party was that if one should be disabled, the other could take his place. Consequently, if an officer was not disabled, there was a superfluous hanger-on. Before the re-organisation took place, Provincial officers did the work which the second officer now performed. When he said there should be more subordinates, his idea was that a larger proportion of the work could be undertaken at a cheaper rate and in a shorter time. He thought a larger number of transfers of officers from one Province to another would secure greater efficiency.

70104. (*Mr. Sly.*) It was only in the class of Assistant Superintendents in the Imperial Service cadre that he would like to see a reduction. He considered that the 17 posts of Assistant Superintendent in the Imperial Service were provided partly for officers under training in order to become fitted to hold charge of a party, and partly for officers acting as Assistants to the Imperial officer in charge of a party, and he thought there were too many of such posts. He considered that seven officers under training were quite sufficient, and that no Assistant was required for the Imperial officer in charge of a party. He also recommended that the size of a party should be increased. It was not the case that the size of a party had in recent years been substantially increased. In the past there were as many as 40 to 60 in a party. There had been an actual reduction in the average size of a topographical survey party. A party was divided into three or four sections, under the control of Provincial Service officers. Therefore, if the size of each section was increased, not much extra work would be thrown on the officer in charge. The extra responsibility and hard work would fall on the Provincial man. He agreed that the Provincial officers had to be supervised by the officer in charge of the party, and this meant, to a slight extent, extra work and responsibility for the Imperial officers.

70105. Replying to a question as to whether the amalgamation carried out some years ago had not effected a very considerable improvement in the pay and prospects of the old Provincial Service officers, the witness replied that he joined the old junior division with the prospects of rising to the senior division and a salary of Rs. 1,000 or

Rs. 1,300. He would have been better off if those conditions had been maintained than he was under the present system. The maximum pay of the old Provincial Service was Rs. 1,000 with the personal allowances. He was getting Rs. 1,000 at the present time, which was the highest he could rise to.

70106. (*Mr. Gokhale.*) In the 21 parties in the Survey Department, there were 38 Imperial Officers. He thought if that number were reduced to 21 the requirements of the Service would be satisfactorily met. Prior to 1910, when the reorganisation was effected, 40 Imperial Officers performed the work of the Department, even although there were demands for military purposes from time to time in connection with frontier expeditions. Therefore, there was no reason why the number at the present time should be 55, unless there was more work to be done. He was of the opinion that the original number of 40 would suffice for present-day needs. Of the seven Provincial Officers, four were in charge of parties, and three were in charge of Drawing Offices. He thought such officers, on the whole, were doing their work satisfactorily.

70107. The salary of an Imperial Officer in the same position as he held in the Service would be Rs. 1,700 if he got to the top of his grade. His proposal, therefore, that there should be a maximum of Rs. 1,250 for the Provincial Service, was not very extravagant.

70108. (*Colonel Renny-Tailyour.*) The witness admitted that an Imperial officer in charge of a party might be drawing less than Rs. 1,000. It was also true that only a limited number of officers in the old Provincial Service could rise to Rs. 1,000. With regard to superfluous officers, witness said he could produce a list showing that a second officer was always with a party. It was true that some Provincial Officers did complain that Imperial Officers were sent out too young. He thought that an Imperial Officer should have at least three years in the Survey before he took charge of a party.

70109. (*Chairman.*) Witness said he could not specifically say to what extent the Imperial Service of the Survey Department was over-recruited, but if the Provincial Service was allowed to hold temporary charges of parties, Imperial Officers could be spared for frontier work.

(The witness withdrew.)

KHAN BAHADUR SYED AULAD HOSSEIN, Officiating Deputy Superintendent, Survey of India Department.

Written Statement relating to the Survey of India Department.

70110. **(I) Methods of Recruitment.**—The existing rules for the recruitment of the new Provincial Service of the Survey of India as contained in enclosure No. 1 of letter No. 687—84-1, dated 19th June, 1909, from the Government of India, Department of Revenue and Agriculture, are suitable. In paragraph 4 of these rules the qualifications required for nomination for the competitive examination may be more clearly defined by inserting the words "for the Assistant Engineer Class" after the words "entrance examination" and before "of the Thomason Civil Engineering College," as there are several classes in that college for which various degrees of educational qualifications are required. It may be added that candidates who have passed at least the First Arts or Intermediate examination of an Indian University can also be admitted to the competitive examination.

The other methods of recruitment, namely (*1*) by direct appointment of candidates possessing high educational qualifications detailed in the above rules, and (*2*) by transfer of deserving officers from the Upper Subordinate Service, should be held good.

70111. **(II) System of Training and Probation.**—Under the existing arrangements a Provincial Service Officer on first appointment, is attached to the Survey Training School where he is generally kept for one year, after which he is posted to a field party according to the requirements of the Service and may be kept in the same branch of the work for a number of years. I would suggest that after passing out of the Survey Training School an officer may be posted to the Topographical branch for the first two or three years and then to the Trigonometrical branch for a similar period. He should then be attached to the Headquarters Offices of the Survey of India for one or two years in order to get a thorough insight into the work carried out in the drawing and other sections of those offices, including accounts and correspondence This would complete the training of an officer, after which he may be posted to any branch permanently.

The period of probation for a Provincial Officer is at present fixed as three years. This appears to be too long. Under the old rules which were in force prior to 1909, a candidate after passing the competitive examination was generally confirmed in his appointment after one year's probation, if he proved his fitness for the Service. I would, therefore, respectfully suggest that the maximum period of probation may be reduced from three to two years; that the probationers who have given satisfactory proof of their fitness for the work of the Department in the first year of their training in the school may be confirmed without any further delay, and that only in exceptional cases a probationer may be tried for another year, after which, if he fails to prove his fitness for retention in the Service, he may be got rid of.

70112. **(III) Conditions of Service.**—The conditions of Service in the Survey of India are probably harder than those in any other Department. A Survey Officer is bound by agreement to serve in any part of India or Burma: he has to work in the field for at least six months every year, generally under most trying conditions, being exposed to the extreme rigours of the weather and often put to great personal discomforts and hardships: he has during the field season to remain away from his family and has thus to keep two establishments and incur extra expenditure in many other ways. While in the field he has generally to work at a considerable distance from his headquarters and in the course of his duties he has to mix with the local Civil, Public Works Department. Railway, and other officers. This makes it necessary for him to keep up his appearances and live up to a style befitting his position, sometimes beyond his means. His journeys are generally long and transfers are frequent. If he is a man with a family and children, the half-yearly moves from recess to field and *vice versâ* drain off a good portion of his income.

A Provincial Officer in the Survey getting less than Rs. 500 is treated as a second-class officer for the purpose of travelling allowance, which entitles him to Rs. 3 per day in the field and to double second class fare by rail. This is hardly sufficient to recoup him for all the expenditure incurred by the nature of his field work. The restriction of being allowed only second-class fare by rail is looked upon by the Provincial Survey Officers concerned as a great hardship, considering that their contemporaries in the Public Works Department, Postal, Telegraph and some other Departments drawing less than Rs. 500 are allowed to travel first-class by rail, although their journeys perhaps are not quite so long as those of the Survey Officers. This has the effect of lowering the status and the prestige of the Survey Officers in the eyes of the officers of other Departments with whom they come into contact in connection with their duties. It is highly desirable both in the interests of the officers concerned and in the interests of the Government work that all Provincial Officers of the Survey of India may in future be treated as first-

class officers for the purpose of travelling allowance.

The present designation of the "Provincial Service" of the Survey of India appears to be a misnomer, because the members of the Survey of India are not confined to any one Province but are liable to be employed in any part of the Indian Empire. Perhaps a more appropriate designation of the Service would be the "Indian Service," meaning the Service recruited in India against the "Imperial Service" recruited in England.

70113. **(IV) Conditions of Salary.**—The conditions of salary of the Provincial Service have been considerably improved recently by the kind and generous grant of the time-scale pay to all the officers.

While thankfully acknowledging this concession the Provincial Officers feel compelled to bring to the favourable notice of the Government of India one point on which they find that they have still a ground of complaint.

They are granted triennial increments of Rs. 50, while their more fortunate contemporaries in the Public Works Department, Telegraphs and Forests, who have also been placed on time-scale pay lately, have all been granted annual increments varying from Rs. 25 to Rs. 35. The Provincial Officers of the Survey of India would, therefore, beg that the present triennial increments of Rs. 50 may be graciously converted into annual increments of, say, Rs. 20.

70114. **(V) Conditions of Leave.**—A Survey Officer, owing to the urgent and pressing nature of his work, cannot ordinarily avail himself of privilege leave during the field season, which generally lasts for at least six months every year. The period during which he can have a chance of getting the leave is, therefore, restricted to less than half a year. He is, therefore, placed at a disadvantage in respect of privilege leave as compared with his contemporaries in other Departments who may be able to get the leave at any time of the year. During the recess season the Survey Officers are employed at certain selected stations which, in the majority of cases are at considerable distances from their homes, so that, ordinarily, Survey Officers cannot generally afford to take privilege leave for short periods and run up to their homes.

Under the existing rules privilege leave is not allowed to accumulate for more than three months. This tells very heavily on the Survey Officers under the peculiar circumstances explained above, for they are prevented from availing themselves of the leave more frequently, firstly, owing to the restricted time at their disposal, secondly, owing to the exigencies of the Service, and thirdly, owing to their homes being at considerable distances from their stations of employment. They would, therefore, look upon it as a great boon if Government sees its way to allowing the privilege leave to accumulate up to six months. The present restriction of six months of duty between any two periods of privilege leave may be relaxed in cases of illness or urgent necessity, the genuineness of which may be proved to the satisfaction of the authority granting the leave.

The amount of furlough on half pay may be extended from two to three years, which may be granted as follows:—

After 8 years' service 1 year's furlough.
" 16 " " 2 " "
" 24 " " 3 " "

The whole period of furlough qualifying as service for pension.

70115. **(VI) Conditions of Pension.**—In consideration of the exceptionally hard and arduous nature of the work that Survey Officers have to perform and the great physical trials to which their constitutions are generally exposed, they may be granted the option of retiring on pension on completing 25 years' qualifying service, without producing a medical invaliding certificate.

2. The amount of pension may be calculated on the basis of average emoluments for the last year's service instead of the last three years as at present.

3. The maximum amount of pension admissible, viz., Rs. 5,000 per annum, was fixed at a time when the purchasing value of the rupee was much greater than it is now. While the amounts of salaries in most cases have since been revised and increased the maximum amount of pension has as yet remained the same as originally fixed. It is, therefore, prayed that the maximum amount of pension admissible may be raised from Rs. 5,000 to Rs. 6,000 per annum.

4. All pensions may be exempted from income tax.

70116. **(VII) Limitations in the employment of non-Europeans.**—The Provincial Service of the Survey of India, or the Junior Division as it was then called, was prior to 1886 almost exclusively recruited from among the Europeans or Eurasians. It was in 1884 that the Government of India decided to reserve 25 per cent. of the vacancies in that Service for Indians This was probably only a tentative measure, as no Indians of any high educational qualifications had till then been employed in the higher grades of the Survey, the subordinate Indian establishment having been generally recruited from classes possessing but little educational qualifications.

From 1891 Indian candidates began to enter the Provincial Service by competitive examination. With the very limited number of vacancies available for the Indians the Service did not readily become popular or even generally known to the educated classes of the Indians and thus in a measure it failed to attract the best qualified Indian candidates whose ambitions naturally carried them to other more popular Departments such as Civil, Judicial, Public Works Department, etc., in which they could eventually hope to attain far higher and more dignified positions.

The Government of India in Revenue and Agriculture Department letter No. 687—84-1, dated 19th June, 1909, has materially improved the proportion of Indians to be admitted to the Service by ordering that *at least* one appointment should be given to an Indian candidate for every three Europeans or Eurasians appointed. With the gradual increase of the number of Indian officers in the Service some of whom are now getting in the higher grades, and the better prospects recently sanctioned by Government, the Provincial Service of the Survey of India is now becoming more popular among the educated classes of the Indians, and it is believed that Indian candidates possessing high educational qualifications will always be available in sufficient numbers whenever there are vacancies in the Service to be filled up. The time has, therefore, now arrived that Indians should be allotted a much larger share in the Service in future than has been the case in former years.

70117. **(VIII) Relations of the Service with the Indian Civil Service and other Services.**—The Provincial Service of the Survey of India has no direct relations with any other Service. The Survey Officers, generally during the field season, have to come into contact with the Civil and other local officers of the districts in which they have to carry out their operations and the success of their work, to some extent, depends upon the help and co-operation of the latter. The improved positions recently conferred by Government on the Provincial Survey Officers will, it is hoped, materially help them in getting better regard and respect from the District Officers in future.

KHAN BAHADUR SYED AULAD HOSSEIN called and examined.

70118. (*Chairman.*) The witness said he had been 23 years in the Service. He passed the competitive examination, coming out first, obtaining 815 marks in Mathematics out of 1,000. At present he was in sole charge of a trigonometrical party. There were seven of such parties, two of which were held by Provincial officers and five by Imperial officers. He and three other Officiating Deputy Superintendents of the Provincial Service were in charge of parties. He thought the

number of Indians in the Provincial Service should be increased, and that the proportion of one-fourth was too small. He suggested the proportion should be one-half, but open competition would be even better.

70119. He regarded the title of "Provincial Service" as inappropriate, and suggested the title of "Indian Service," *i.e.*, the Service recruited in India against the "Imperial Service" recruited in England. He favoured the re-introduction of the old system when Survey Service was divided into "Senior and Junior Services," because in previous days many junior service officers were eligible for promotion to the senior division by selection, and every year the number of junior service officers in the senior service ranged from 13 to 15, the pay being between Rs. 1,000 and Rs. 1,600. At present the pay of the Provincial Officer was limited to Rs. 1,000, including charge allowances. Under the old system there were no charge allowances.

70120. With regard to training and probation, he was satisfied that it would ordinarily be possible to find out definitely in two years whether a Provincial Service recruit was fit for confirmation. If his scheme were carried into effect, and the Service was divided into senior and junior, as before he thought a First Arts or L.C.E. examination would be a necessary qualification for an officer recruited in future before being promoted from the junior into the senior service. He would not make the test for entry to the Service higher than it was at present. He thought the present competitive examination was sufficient.

70121. He did not think it necessary for a junior officer before being promoted to the senior rank to go to Europe for any further training. He thought a man could learn all that was necessary to qualify him for the higher charge and responsibility in India.

70122. With regard to the present scale of salary, he would like to see annual increments of Rs. 20 as in the Forest, Telegraph and Public Works Departments, instead of triennial increments of Rs. 50.

70123. He thought if the present period of furlough was extended to three years, Provincial Officers would take advantage of the concession.

70124. He suggested raising the maximum pension to Rs. 6,000 a year. Such a proposal would benefit officers in the Provincial Service. The present pension was Rs. 5,000 a year, and it ought to be raised to Rs. 6,000 a year.

70125. He would like to see a single cadre in which Civilian Officers when on the same standing as military officers would be paid at rates equal to three-quarters of those payable to military officers. He did not consider that a Royal Engineer officer, with his superior training, was qualified for an unreasonable higher rate of salary. He would prefer to see all placed on the same basis except that the pay be in proportion as stated above. The professional qualification was the same for the Imperial and the Provincial Service. There might be only this difference that the Imperial Officers were superior in educational qualifications, but the Departmental qualifications were the same. The former was of some advantage in Scientific Departments. He thought the experience gained in the Service was as valuable as the high training of an officer prior to entering the Service.

70126. There was a widespread desire on the part of Anglo-Indians for service in the Survey Department. There were about three or four vacancies every year, for which from 18 up to 60 Anglo-Indians and Indians presented themselves. The number of Indians was generally greater than the number of Anglo-Indians.

70127. He considered the Imperial branch of the Service was over-recruited. Prior to 1904 the number of Imperial Officers was 38 and the number of Provincial Officers 142. The Survey Committee of 1904-05, composed entirely of Imperial Officers and in which the interests of the Provincial Officers were not represented, recommended that the number of Imperial Officers should be increased, and the number of Provincial Officers decreased. They fixed the number of the former officers at 55, and the number of the latter at 87. The Departmental Committee of 1910 presided over by Colonel Burrard, and composed of both Imperial and Provincial Officers, decided that the members of the Survey Committee were wrong in saying that Provincial Officers were unfit to hold charge of parties, and that each party ought to have two Imperial Officers; and they established the fact that Provincial Officers were as capable of holding charge of parties as Imperial Officers.

70128. (*Mr. Gokhale.*) Officers of the Provincial Service holding executive charges, were doing their work quite as well as the Imperial Service Officers. Many Provincial Officers had done splendid work on the frontiers with military expeditions, and also on geographical explorations. All the actual Survey work of such expeditions was done by Provincial Officers under the nominal supervision of Imperial Officers. Their work had been recognised by Government, and if asked to do so, he could put in a statement giving names and references. He himself, before having charge of a party, taught Imperial, Provincial and Upper Subordinate Officers, astronomical observations and computations and he had prepared a book on astronomical computations, which had been examined and appreciated by Colonel Burrard. It would not be true to say that it was difficult to obtain Indians with suitable physique and capable of sanding the rough life of a Survey Officer. He thought a sufficient number of Indians would be forthcoming, especially as the new Provincial Service Regulations had improved prospects. Indians could manage parties and detachments as well as Imperial officers. There was no difference between Indians and Anglo-Indians in that respect. It was possible to make arrangements at Dehra Dun to give the higher education which Imperial Officers started with. If that were done it would be possible to recruit Indians direct into the Imperial branch.

70129. (*Mr. Sly.*) Provincial Service Officers had been placed in charge of trigonometrical parties as well as in charge of topographical parties.

70130. The majority of Provincial Service Survey Officers did not subscribe to the Provident Fund. He could not say what the reason was.

70131. (*Mr. Madge.*) His proposals with regard to increased rates of travelling allowance applied only to Provincial Officers drawing pay from Rs. 250 to Rs. 800. He thought if the prospects were improved the Provincial Service would attract a better class of officers.

70132. (*Sir Valentine Chirol.*) He admitted that the Survey Service was not large enough to justify Government in undertaking the expense which would be entailed by the creation of an educational establishment in India on the same lines as those in England. The desired training could be easily provided at any of the existing Colleges at Sibpur, Rurki, etc.

70133. (*Colonel Renny-Tailyour.*) With reference to his statement that Colonel Burrard's Committee had laid it down that Provincial Officers were as fitted to take charge of parties as Imperial Officers, witness admitted that he had not seen the Report of the Committee. His ground for making such an assertion was that the Committee would not have been in favour of amalgamating both services if they had thought otherwise, and there was also the fact that seven major charges had been given to the Provincial Service which was considered unfit by the Survey Committee of 1904-05 and which did not enjoy this privilege for a few years before. He did not admit that Colonel Burrard's Committee of 1910 thought the old Service had a grievance, and that it was in order to redress this grievance that it gave them to a certain extent some of the terms of the new Service.

(The witness withdrew.)

At Calcutta, Thursday, 22nd January, 1914.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

SIR VALENTINE CHIROL.
WALTER CULLEY MADGE, Esq., C.I.E.
FRANK GEORGE SLY, Esq., C.S.I.
HERBERT ALBERT LAURENS FISHER, Esq.
R. R. SCOTT, Esq. (*Joint Secretary*).

H. W. BIGGIE, Esq., Officiating Deputy Superintendent, Survey of India Department.

Written Statement relating to the Survey of India Department.*

70134. *Preface.*—The views I desire respectfully to place before the Public Service Commission represent not only my own personal convictions but those of the Anglo-Indian Association by which I have been unanimously elected as its representative spokesman. It remains for the Commission ultimately to estimate the true value of the suggestions I make. I would, however, beg that tribunal to believe that these have been reached only after anxious thought, are widely and strongly held, and are submitted with the knowledge that the principles they enforce are of far-reaching consequence to a large and loyal body of men whose past services, present position, and future prospects are not merely a matter of private but of Imperial concern. I and those behind me feel that the very existence of the Provincial Department of the Survey of India is at stake. That great executive and administrative branch of the Government of this country has since its inception in 1763 afforded an honourable avenue of livelihood, and preferment to the Domiciled Community. Its records attest the capacity and competency of that Community to deal effectively with the serious trust committed to its care. To-day it is painfully obvious that those in charge of the destinies of this country are bent on depriving it of one of its important sources of employment and sustenance. I venture respectfully to submit that such an encroachment and limitation upon the wage-earning resources of the Domiciled Community would constitute not merely a grave injustice to a body of men capable, from every point of view, of faithful and efficient work, but would amount to a reversal of the policy of Statesmen who have striven to foster and stimulate local loyalty, and to increase and broaden the avenues of remunerative employment. It assuredly would be regarded as a serious infringement of the principles of the Queen's Charter of 1858 which promised an equal treatment of all men alike irrespective of colour, caste or creed. I do not presume to dictate any line of policy. But I do venture, very humbly, yet very earnestly, to suggest that any proposal to disfranchise a portion of the King's subjects or to extinguish any line of economic advance justifies a strong and united, if temperately voiced, remonstrance from the prospective sufferers. The discontinuance of the Opium Department is a loss which falls heavily on the shoulders of the Anglo-Indian. That was, however an inevitable outcome of the policy which on large moral grounds forbade the cultivation of the poppy. No similar reason exists for the threatened absorption of yet another great branch of a local and thriving organisation.

1. The Commission is already so familiar in the Memoranda of various officers with the details of our grievances under the specified nine heads that I shrink from wearying them with further minutiæ. I am content to accept and endorse in the main the views put forth by Mr. Greiff and Mr. Petters and Mr. Byrne. I would prefer to confine myself to questions of principle, and to the emphasising of a few of the minor but important heads.

2. The revised constitution of 1895 was the first blow administered to the men recruited in India. The last and final blow is the suggestion that the Survey Department is to be militarised, and henceforth to be closed to the legitimate ambitions of the Domiciled Community. Previous to 1895 the Survey was divided into a "Senior" and a "Junior" Service. Promotion was open to all alike, merit being the test. When effect came to be given in 1895 to the recommendations of the Public Service Commission of 1886, we saw retrogression substituted for advance. The reorganisation into an "Imperial" and a "Provincial" Service shut the door on preferment, unnecessarily accentuated the social differences between the two, placed an unmerited slur upon the ability and trustworthiness of the local recruits and, drawing, continued an invidious distinction between men who in the main rendered similar services under similar conditions but on different scales of pay, and in differing social and official environments. Enquiry into Survey grievances has not always been a matter of unmixed comfort. We have seen the larger field anterior to 1886 contracted into dimensions which squeezed our countrymen out of promotion, and we are threatened to-day with a further reorganisation which will "improve" us altogether out of existence.

3. In our view the difference between the Imperial and Provincial Services should be abolished. Both Services are superior Services. Differentiation between the two is impossible without room for offensive if unearned comparisons. The work which a Provincial Officer does is no more Provincial than is the work of an Imperial Officer, nor is it less Imperial than the work of his higher-classed colleague. Their duties summon both alike into endless varieties of climate, locality and difficulty. The Survey Committee of 1904-05 [Report, Part I. page 58, para. 101] recognised and enforced this.

4. There should be but one list on which all officers should be placed. Conceding the necessity for making provision for a certain proportion of the Military element and for the reservation of a few of the higher posts to a particular class, we contest the position that there is no room for the further employment of Civil officers. We deny altogether that we are less fit morally, intellectually or socially than the non-commissioned officers with whom it is proposed to replace us, and we appeal to the Roll Call of our Service since its formation to testify to the zeal, efficiency and integrity with which our kith and kin have met and discharged their duties. We are as capable of enforcing and of rendering obedience as are Military Officers, and we are not prepared to admit that the work of the Survey Department would, from any standpoint, be improved by the introduction of a military precision of dress and manner to which we are foreigners. If at times during a survey military exigencies necessitate a closer touch with delicate situations, a greater caution and a severer reticence, we submit we are as quick to attornment on a point of honour or to loyalty to a trust as is the most upright soldier who ever donned the King's uniform. We have proved our capacity and we feel that to immolate us for such reasons would be to insult us in that on which we rightly profess ourselves to be tender.

5. A scrutiny into the result of the various reorganisations of my Department is not conducive to much self-congratulation. The effect of the changes of 1895 was to alter our status from one of equality to one of subordination. It further

* This statement embodies also the opinion of the Anglo-Indian Association, Calcutta, which was represented by Mr. **Biggie.**

deprived us of a long existing and long exerted right to promotion by barring us from entering into the Imperial Service, the substitute of the old Senior Division. This was the less defensible that the Senior Division, consisting of 50 officers, at that time contained no fewer than 13, or about one-fourth, who had risen from the Junior Division. Again, previous to 1895, 13 out of the 50 appointments in the Senior Division were held by officers promoted from the Junior Division. In 1895 ten of these appointments were transferred from the Senior to the Junior Division to form the Provincial Service. These ten appointments represented in salary a monthly total of Rs. 7,850. But in the progress of the transfer a curious mutilation took place. When the appointments reached the Provincial Service the Rs. 7,850 had been attenuated to Rs. 5,700, a loss roughly of over 25 per cent. (Report of Survey Committee, 1904-05, Part I, p. 23.) The nett result, therefore, of the 1895 reorganisation was to inflict a three-fold injury. The Provincial Service was barred from its former promotion; its so-called compensation for the loss got whittled away in the course of its transfer; and the bar created a loss in status and prestige from which it has never recovered.

6. In 1904-05 a Committee assembled to enquire into the working of the Indian Survey Department. Its members consisted of the Hon. Mr. Miller, I.C.S., Col. Sir John Farquharson, R.E., an expert on English Survey questions, Col. Longe, R.E., Surveyor General of India, and Colonel Kelly. Of these the Chairman and Colonel Kelly possessed no Survey qualifications, Col. Farquharson possessed no knowledge of India, and to Col. Longe, R.E., the Provincial Service was not quite an idol. Once more a re-organisation took place in 1909-10. This time a New Provincial Service was created consisting of ten superior appointments ranging from Rs. 600 to Rs. 1,000, and 77 others, ranging from Rs. 250 to Rs. 600. Only men who had joined the Provincial Service after 1905 were eligible by nomination of the Surveyor-General to the new Provincial Service. All the other members of the Provincial Service were barred. The Surveyor-General nominated nine officers to the lowest grade from the Old Provincial Service to form the New Provincial Service. This latest creation lasted, under protest, two and a half years, when it was amalgamated on the 1st March, 1912, after a storm of discontent which called into being a Departmental Committee in 1910, with the old Provincial Service.

7. The New Provincial Service started life as I have shown with ten Superior appointments which were never filled ranging from Rs. 650 to Rs. 1,000 and 77 others ranging from Rs. 250 to Rs. 600. When it died on the amalgamation the maximum pay of the ten superior appointments was reduced from Rs. 1,000 to Rs. 800, while the emoluments of certain posts, including the two highest, were reduced so as to inflict a nett loss of Rs. 800 a month to the old Provincial Service.

8. On the amalgamation in 1912 a Time Scale was introduced for the first time for the Provincial Service. But the Imperial Service had had the benefit of this scale in 1910. The method of application of the Time Scale to the Provincial Service was remarkable. While officers drawing less than Rs. 300 a month were rightly placed upon a true Time Scale as from the date of their entrance into the Department, all officers drawing from Rs. 300 to Rs. 500 were wrongly placed upon an arbitrary Time Scale as from the date of the amalgamation, the 1st March, 1912. Officers drawing over Rs. 500 got nothing. No reason was vouchsafed for this difference in treatment. It cannot be supported on principle. Its effect has been to place in some instances officers of equal service on unequal pay, in others officers of unequal service on equal pay, and in very many cases to deprive officers of that augmentation in pay which they would have secured had the principle of the true Time Scale been throughout enforced.

9. The contrast in treatment of the Imperial Service intensifies the grievance. We do not grudge them their prizes. We deplore merely our own loss. These officers were granted a Time Scale which dated not from the date of their entrance into the Department but from the date of their first commissions in the Army. I take an illustration. A Royal Engineer Officer draws Rs. 370 from the date of his Commission. Five years after he joins the Survey of India. He starts on Rs. 370 plus Rs. 250, that is Rs. 620. Under the old scheme prior to 1910 he would have started on Rs. 500. Under the 1910 Scheme he starts with Rs. 70 a month more. This Rs. 70 is unearned increment. After 19 years' service the same officer ordinarily draws Rs. 1,500 plus Rs. 200 charge allowance or Rs. 1,700 in all. The Provincial Officer draws after 20 years' service Rs. 550. The increase under their reorganisation scheme for the Imperial Officers amounts on an average to an increase of over 30 per cent. On the other hand, the increase under the reorganisation scheme for the Provincial Officers amounts on an average to an increase of little less than 12 per cent. No reasons have ever been given by the Government of which we are aware for these liberal, if invidious, increases granted to one branch of the Department. Whatever circumstances justified these measures would apply with equal force to the Provincial branch of the Service. I do not think I am unduly pressing the point if I submit that the Government is morally bound to give the Provincial Officer a Time Scale of pay with retrospective effect either from the date that that scale was sanctioned for Imperial Officers or from the date when the new Provincial Service was constituted, the 1st August, 1909. As things stand, some of he officers (in number nine), who joined the Provincial Service in 1905 and after, date the benefit of their Time Scale as from 1909, while others who joined at the same time date their benefit as from 1912, or three years later. I submit this difference in treatment is unjustifiable.

10. Once more, in other Government Departments, for instance the Forests, the Provincial Officer draws two-thirds of the pay of the Imperial recruit in the higher grades. In the Survey of India, however, the Provincial Officer draws on an average in the higher appointments only a third of the pay of his Imperial colleague. The average of all the appointments in both Services contrasted shows that the Provincial only draws a fourth of the pay of the Imperial recruit.

11. In some measure the anomalies referred to can be fairly traced to the fact that the views and grievances of the Provincial Department were very imperfectly voiced, if at all, either at the Public Service Commission of 1886 or on the Survey Committee of 1904. At the latter enquiry Sir John Farquharson made this contribution to the value to be attached to the pronouncement of his committee on the Provincial question: "Being still ignorant as to what functions they (the Provincial Officers) are supposed to discharge, what their qualifications are, and how they perform their duties, I must for the present pass by this branch of the subject." This admission of the ignorance of all members of the Committee who were not members of the Survey of India (of whom there was only one representative, Col. Longe) is generous and complete. By its light the following comment in the Report of the Committee, signed by all the members including Sir John Farquharson, does not appear to possess much intrinsic worth. Yet it probably carried great weight with the Government, and no one can now tell what part it played in the final overthrow of the unfortunate Department against the members of which it was aimed without evidence: "The accounts we have received of the general capacity of members of the Provincial Service to undertake independent and responsible charges are not satisfactory, but it does not appear that there has been much opportunity of trying them in such posts since the Service was reconstituted, and under existing arrangements such officers, by the time they reach the higher grades of the Service, are well advanced in years, and cannot be expected in all cases to retain the energy required for the efficient direction of topographical operations."

12. This we submit is criticism based on no foundation, and therefore, without justification. That portion of it which purports to be apologetic of the alleged shortcomings of Provincial Officers stands clearly self-condemned. If officers have not been afforded occasion for the display of stated qualities the blame lies with the system not with the officers. The system should be amended, not the officers erased. One point stands out clear and distinct. Not one single instance of proved incapacity among Provincial Officers has been cited. On the contrary, in a note of dissent in the Report of the Survey Committee, the Chairman, the Hon. Mr. Miller, wrote thus: "The intention of that measure (the transfer of 10 appointments to the Provincial Service) was that the superior posts should be held by Provincial Officers and until it is conclusively shown by actual experience that the latter are unequal to the responsibilities of such posts, I cannot recommend any change of policy." We are thankful for the fairness of that view, which is the just view. On the other hand, I would beg leave to mention as instances, among many others, of proved fitness for high office among the Provincial Officers the names of Mr. T. Shaw, late Superintendent, Provincial Surveys. Assam, a post now held by an Imperial Officer, Mr. R. B. Smart, who, after retirement, has been specially placed in charge of the Calcutta Town Survey, having held charge of a Revenue Survey party prior to retirement: Mr. A. W. Smart, who, prior to pension, also held charge of a Revenue party; Mr. T. E. M. Claudius, who distinguished himself on the Frontier, and was rewarded with the charge of a topographical party, who received a medal and clasp for the siege of Shepur, who crossed the Frontier in disguise and mapped the whole of the Tirah and Afridi countries, and who ran several important series of triangulation in Baluchistan and the trans-Indus country; Mr. H. Todd, who held similar charge and whose work was specially commended by the Board of Revenue, Madras; Mr. G P. Tate, who did service in Afghanistan, Baluchistan, on the frontiers of Persia, and was placed under Sir Robert Sandeman in Political and Administrative charge of the Kej and Tanjgar Districts, in Kalat, on the borders of Afghanistan; who held independent charge of the Aden Surveys, conducted a reconnaissance in the Aden Hinterland and was given independent charge of the Riverain Survey in Sind, who in 1895 was appointed to the independent charge of the Surveys in connection with the Baluch-Afghan Boundary Commission where he replaced an officer of the Royal Engineers, who in 1899 served with the Mission to the Persian Frontier and carried the secondary triangulation up to the Kuh-i-Malik Shah and into Sistan, of whom the Agent to the Governor-General in Baluchistan thus addressed the Foreign Depart- in 1899: "His duties were to hold charge of the country (Kej and Tanjgar) on behalf of the Kalat State, to administer the Revenues as well as generally to carry on those political duties which were connected with that administration," of whom Sir Robert Sandeman wrote in 1892: "The Government of India will I venture to hope agree with me that Mr. Tate's services have been of an exceptional character both professionally and politically. Should the opportunity present itself I shall be glad if some special mark of approval can be accorded to him," who in 1902 took charge as Chief Survey Officer to the Sistan Boundary Commission, and who for two years was daily associated with Sir A. H. McMahon, the Commissioner. Of officers still in active employ I would cite the names of Mr. H. G. Shaw, J. O. Grieff, Awlad Hossein Khan Bahadur, who are all at present in charge of survey parties. The posts of Chief Draftsman and Head Draftsman of the Calcutta Drawing Office, and three posts of officers in charge of Circle Drawing Offices and the charge of the Cantonment Surveys are all committed to Provincial Officers. Mr. W. Newland is now in charge of the Bombay Town Survey. Of officers promoted from the junior to the senior division prior to the reorganisation of 1895, I would mention illustratively, Mr. G. B. Scott, on whom Government this year have bestowed a C.I.E. for distinguished services rendered during the Black Mountain Expedition (for which he received a medal and clasp) and for purely Civil employment; who holds a war record unsurpassed by that of any Military Officer in the Department, and who, among other distinctions elsewhere, won a sword "for gallantry" in repulsing a night attack by the Allahiwal; who was mentioned in despatches for conspicuous gallantry in the Michni country and who was the first European to ascend the Safed-Ko; who for his services in that expedition received a medal and clasp; who was recommended by the Viceroy and Commander-in-Chief for a direct Captaincy in the Staff Corps, which was never bestowed, and who thrice received the thanks of Government; Mr J. B. Henessey, M.A., F.R.S., who held the post of Superintendent, Trigonometrical Survey; Mr. J. O. N. James, who was Assistant Surveyor-General when he retired; Mr. J. C. Clancy, F.R.G.S., who closed his career as Assistant Director, Land Records, Burma; Mr. McCarthy, F.R.G.S., at one time Director of Imperial Surveys, Siam. The list is by no means exhaustive. But I trust I have advanced sufficient evidence, beyond the reach of cavil or criticism, to justify the claim that the Provincial Service contains splendid material upon which England can draw with confidence for men on whom to rely in their ordinary avocations, and on whom she can count in moments of exceptional stress and trial.

13. If the list be not longer of those who have passed with credit and emerged with distinction from tests sufficiently severe to place a strain upon the strongest constitutions among the Imperial Officers, the explanation lies in the admission of the Survey Committee that the opportunities afforded the Provincial Officers have been few and far between. We feel confident that our Service is equal to every emergency and has vindicated itself by living example against the cruel and unmerited reproach that its members are unequal to the tasks of facing danger, of guarding a trust or of assuming responsibility. With such a record behind it, with such modern contributions to its present vitality and with the assured promise, based upon proved performance, that its future will not be less brilliant than its past, I may be permitted to protest with all earnest strength and sincerity against the proposal that the Provincial Service should cease to exist.

14. All recommendations for change in the Survey Department have hitherto proceeded upon the ostensible basis of economy. If this were correct, it is difficult to see why the salaries of the Imperial Officers of the Survey have been increased to a point in excess of the salaries drawn by similar officers in the Public Works and Military Works Departments for which their past training particularly fits them. Let me illustrate. In the Military Works Department a Captain over 15 years' service receives Rs. 783 a month; in the Public Works Department an Executive Engineer in the 15th year of his service receives Rs. 1,000 a month; in the Survey of India an Imperial Officer in the 15th year of his service receives in all Rs. 1,450 a month. A Provincial Officer of the Survey of India draws in his 16th year only Rs. 450. No greater intellectual fitness is needed in the Imperial branch of the Survey Department than in the Departments quoted for their contrast. Yet the pay is enhanced without any equivalent consideration. I abstain from all imputation of motives. But it is very difficult to resist the inference that the Imperial Survey Officer has, for some unknown reason, become the special object of official protection and advancement not merely at the cost of his brother officer in the Provincial branch, but out of all proportion to the salaries of officers doing not less strenuous work in other departments of the administration.

15. While we may be forgiven for objecting to a system of economy enforced at our pecuniary expense, we would also pray forgiveness for hinting that if our Imperial brethren were to be paid at the same rate as their colleagues in other

branches of the administration there would be freed for distribution among the Provincial Officers a large sum of money available for a very appreciable betterment of their condition. There is no satisfactory defence to be found for the system of charge allowances to officers drawing Rs. 1,000 and over per month. No such allowance is granted in any other Department. The salaries there bestowed are held adequate to the services rendered. They should so be held in the Survey Department. The Public Service Commission of 1886 held out the promise that all Provincial Services should be treated alike as regards "conditions and prospects" which has always been read as a promise to equalise in all Provincial Services the furlough, pay, pension and status of their respective officers. (Report of Survey Committee, Part I., paragraph 101, p. 59: Part I, paragraph 40, p. 22.) The promise has not been kept. The starting pay in the Provincial Telegraph Department is Rs. 250 per mensem; in the Provincial Public Works Department it is the same; in the Provincial Forests Department it is Rs. 270 per mensem; in the Provincial Survey Department it is Rs. 100 per mensem. Let me contrast a later stage. In the 20th year of his service in the Provincial Telegraph Department an officer draws Rs. 850 per mensem; in the Public Works Department he draws the same; in the Forests Rs. 700 per mensem; in the Survey Rs. 500 per mensem. The Survey Committee of 1904-5 commented on this inadequacy of the starting pay of our Service. Yet nothing has been done to abolish or mitigate the anomaly.

16. In other Provincial Departments all officers receive travelling allowance at first class rates. The routes these officers traverse are mainly confined to beaten tracks such as roads, rivers and railways. Our officers are called upon frequently to traverse unbeaten tracks where the nature of the country forbids the possibility of easy or speedy travel. Other Provincial Officers are provided with rest-houses, crockery and furniture. We are not. We are compelled to carry our own and at our own expense. Yet our officers receive only second class rates until they attain a salary of Rs. 500 a month. Under Article 1002 of the Civil Service Regulations first-class rates of Travelling Allowance are admissible to all officers in a grade the maximum pay of which is not less than Rs. 500. Under our old system we were graded, and those grades the maximum pay of which did not reach Rs. 500 were classed as second class for the purposes of travelling allowance. Under the reorganisation of 1909 the intermediate grades between Rs. 250 and Rs. 600 were abolished. Hence the entire grade of Extra Assistant Superintendent as now constituted would be entitled to travelling allowance on first class rates. But the Government interfered and passed a special order (No. 539, dated 18th January, 1910) whereby they disrated all Provincial Survey Officers drawing less than Rs. 500 a month from first class travelling allowance. Not only is the position of the Provincial Officer worse now than before the first reorganisation as to promotion and status, but he is deprived of pecuniary advantages, to which after reorganisation he would have been entitled, by a special and adverse interposition of a Government professedly anxious to better his position. Once more. In the Subordinate Service of other Departments if an officer of admittedly subordinate rank holds honorary rank in the Provincial Service of his Department, irrespective of the quantum of his salary, he at once draws first class travelling allowance (Appendix 18 Civil Service Regulations). In our Service, although it is not a Subordinate Service, no officer can draw such rates unless his salary amounts to at least Rs. 500 a month. Against all these invidious and, as we submit, indefensible distinctions I beg respectfully to protest.

17. Allied with the difference in treatment as to travelling allowance is the question of the social discourtesies to which many of us who draw only second-class rates are subjected. I regret the reference, but the discourtesy exists as a fact and is often intolerable. It can to an appreciable extent be rectified or at least assuaged by an equality of treatment of the members of all the Services. It is bad enough to be deprived of a privilege to which we are entitled. It is bad enough to see other Services enjoy a privilege out of which our exclusion was legislated by a special order of the Government. But this becomes worse when in addition to a deprivation which we submit is unjustifiable we are laid open, through no fault of our own, to social indignities which always touch and sometimes trespass over the borderland of impertinences. The Departmental Committee of 1910 collected many complaints upon this unhappy and unpleasant condition of affairs. Lastly our travelling allowance at second class rates does not nearly cover our actual expenses, and though we do not desire to make a profit out of such allowances we protest against that which amounts to a compulsory loss.

18. I would shortly summarise my grounds of complaint so far. Successive reorganisations have left the Provincial Service wounded and weakened at each stage. The old system of unrestricted ambitions and advances has given place to a system of bars-sinister blocking promotion to the higher appointments in spite of proved merit entitled as of right, not favour, to unqualified preferment. Our pay has upon the average been reduced, our number diminished though the Survey Committee called for an increase, our status financially and socially wrecked. Distinctions unrecognised in sister services are enforced with us for no reason assigned or assignable. Travelling rates are forbidden to us which are favoured elsewhere. If one of our officers serving on Rs. 450 a month be sent on a campaign, he ranks as an Assistant Commissary. His brother in the Postal Department drawing Rs. 250 a month as Superintendent sent on the same campaign ranks as a Major or Captain. A distinguished officer of our Provincial Service ranking therein as Extra Assistant Superintendent on Rs. 500 is detailed for the Sistan Boundary Commission and is ranked as a second lieutenant of two years standing. An officer of the Public Works Department detailed on the same journey and of about the same length of service, ranks as Colonel. The Survey Officer mapped out the boundaries, the Public Works Officer built the pillars. Colonel Longe refused the former a recommendation by Sir Henry McMahon which would have removed the glaring inequality of treatment, and the Public Works Officer received the C.I.E. while the Survey Officer got nothing, not even justice. Labouring long but loyally under grievous disadvantages pecuniary, social and sentimental, the Provincial Survey Officer has never failed to discharge his duty with jealous and competent devotion. His reward is to be found in the hostility of those who to-day threaten his existence with the suggestion that he should make way for a system of Military despotism tempered by inflated cost. He is naturally both indignant and alarmed.

19. There is but one remedy for all this. Remembering always our great debt of gratitude to our present Surveyor-General, an exceptional scientist of exceptional humanity, endowed with rare capacity for sympathy and gift for understanding, it lies in demilitarising the existing service, in placing its chief control in the hands of a civilian, in reverting to the old order of unlimited promotion, in abolishing the opprobrious misnomers of "Extra" and "Provincial," in restoring to our Provincial Service social and pecuniary privileges existing in sister branches, in obliterating the charge allowance for all officers drawing Rs. 1,000 a month and over, and in guaranteeing to us under such a reorganisation the resurrection of that harmony in work and cordiality in intercourse, once extant, long buried and forgotten, which will alone give us back our former pride of self and raise our service in the estimation of its officers and in its treatment by authority to a service *primus inter pares* with the other great auxiliary Departments of Indian administration and control.

We have never faltered in our fidelity to our responsibilities. We have always been and still are—shorn, battered, defaced though it be—proud of the work that our Service has done, is doing,

and still has to do. We merely claim the removal of those impediments which unfairly handicap us in our struggle for life and in that struggle place us undeservedly below sister organisations not more important, more devoted, or more effective than our own. To us it is no valid objection that ours is an "unremunerative" Service. The answer is that ours is the parent and the pilot Service. The Public Works could not build their roads nor the railways their bridges, the Forests could not work their reserves, the post and telegraphs could not lay their lines or erect their stations without our maps. The revenue earned for the Government by its various Departments is earned because of the facilities which our Service supplies. The great spending department, the Army, leans upon us for their maps. We make special charts when a Viceroy moves, we prepare them when a new capital is summoned into existence from the ashes of a dead centre. The Executive Officers of the Covenanted Civil Service depend upon our sheets to enable them to assess the ryot and administer the country. As the Evidence Act is the essential handmaid to all branches of Substantive Law, so are we the necessary handmaid to all Departments of Government in this country. We, however, take higher ground. Remunerative or not, ours is a system necessary to the effective control and development of England's possessions. So long as it exists, so long should it be officered by men who, as servants of the King, have the right to claim equality of treatment alike upon large and broad considerations of policy as under statutory declarations embodied in a solemn and well-loved charter. Into that view no question of earnings can, or ought to be allowed to enter.

20. We agree that economy should be strictly enforced in the creation and continuance of our Department. That is a maxim of general applicability, not limited to one branch of any one service. We deny that economy is enforced either wisely or fairly in our Service. The Imperial staff, as at present constituted, is far in excess of the requirements of the work, it has to perform. Its reduction to 20 officers would meet its necessities and set free a large sum of money available either wholly or in part for the betterment of the work in the Department, and of the prospects of its other officers. If at times 20 were found insufficient for Military needs, Colonel Farquharson's suggestion would meet the situation, namely, that Military Officers should be detailed for a tour of duty in the survey of India on their Military pay plus a survey allowance of Rs. 200 a month, the Military and Survey Departments halving the cost. The scheme is equitable. For the first three years the work of these officers would not perceptibly advance the outturn of the Survey Department, whereas much time would necessarily be devoted to their training by the survey, which time would be substracted from survey needs. On reverting to their own Military duties these officers would, thanks to their survey training, be all the more useful and accomplished adjuncts to the King's Army. Such was Colonel Farquharson's opinion.

The Imperial Officer at a higher salary is technically trained at his start by his provincial colleague on a lower scale of salary. There is no reason why the cheaper tutor should not replace his more expense pupil.

What economy is visible in the appointment of an Imperial Officer on Rs. 1,700 a month to take charge of one party when a junior officer of the same branch takes charge of another and a similar party, performing similar functions, on a salary of Rs. 800?

What justification can be pleaded for the extravagance of the charge allowance in the higher ranks?

The Upper Subordinate Service is expensive and useless. It consists neither of subordinates nor of officers. During its existence of four years it has done nothing which distinguishes its work from that of the purely subordinate service. Its abolition would achieve a considerable saving.

The contemplated importation of non-commissioned officers from Southampton is justified by nothing in past history. Of the two examples formerly brought to India both were imported as expert draftsmen and the work of both was proved to be inferior to that executed by men trained locally on far smaller salaries. There is nothing that such officers can do which cannot be done—certainly as well, probably better—by indigenous officers. We insist with out expert knowledge that they can contribute nothing in the shape of skilled labour equal to the work of our Surveyors whether in the field or in recess.

Our Provincial Service is admittedly understaffed [Report Survey Committee, 1904-5, Part I, page 5]. Its necessary and legitimate expansion could be ensured without additional cost from the economies adumbrated here.

21. Against the introduction and extension of the Indian community in our Department we raise no objection. On the contrary we would cordially open our doors to their inclusion provided their initial selection were made from the right materials of which our experience teaches us there is a plentiful, if scattered and somewhat recondite, supply in India.

22. The preparation of this memorandum has been accompanied by many difficulties which I fear may rob it of much of the value it might have claimed had it been the outcome of considerations culled from a meeting of the members of our Service. We have had no opportunity for union and debate. Ours are disjointed suggestions prepared by men who have been compelled to commit their thoughts to paper while they themselves have been occupied in the field dissevered, unorganised, alone. The Postal Department enjoyed the advantage of careful debate presided over by officers specially deputed to watch, to help and to check. We have had no such advantages. And it is in a spirit of apology therefore for imperfections not altogether attributable to my own shortcomings that I submit this paper for the consideration of the Commissioners.

23. I hold no brief for any class. Our Provincial Service has always been open, and I maintain rightly open, both to the Englishman and the Anglo-Indian as contradistinguished from the Englishman, theoretically at least without fear or favour. That is as it should be. Lord Ripon, in 1884, opened the door still wider to the Indian. Of that catholicity of recruitment we approve. But while I write for no class, I ask leave to say a word in especial favour of the Anglo-Indian born and bred in this country. Many of this category have elisted in our Department, many have won distinction and many have rendered services as faithful and effective as the officers of any other category. Without any wish or intention to be considered or to be invidious I would refer to the following names of purely Anglo-Indian officers who have proved beyond contest the fitness of their class for positions of hard physical work and for positions also demanding tact and efficient control of subordinates. I refer to Mr. J. O. N. James, already referred to in paragraph 12, to Mr. A. DeSouza, who rendered valuable service in Burma as Deputy Superintendent, to Mr. C. Wood, who achieved similar distinction also in Burma. These officers rose from the old "Junior" to the old "Senior" Division. After the re-organisation of 1886, I would allude to Mr. T. E. M. Claudius, already referred to paragraph 12, and to Mr. W. Stotesbury, who received the Chin-Lushai medal and clasp and who was in charge of Settlement Surveys in Africa. These two officers retired as Extra Deputy Superintendents of the Provincial Service. In existing times there are, among many others, Mr. M. Gastaud and Mr. P. J. Barrington, now holding office as Deputy Superintendents in the Provincial Service. The exclusion of such officers from the higher rungs of the professional ladder can not be based upon any objection less unworthy than the accidental bar of their local birth and breeding. I challenge any critic to advance and prove from practice and experience one single disqualifying element which in the view of a righteous and unprejudiced tribunal would or

ought to debar them from legitimate preferment. It was, I think, Sir Bamfylde Fuller, who in a public speech said that the Provincial Services were the backbone of the Indian Administration. The paucity of such generous recognition cannot alter facts. And the fact is that the approbation was deserved and is still true. While of late years successive waves of political advance have lifted the Indians to a position of which their own organisations had no conception and of which they did not dream a short decade ago, the Anglo-Indian, manfully striving to improve his social and economic status, finds himself combating currents of antagonism and bias which retard his progress and now threaten to deprive him of a source of employment in which he has proved himself not unequal to his surroundings. Against such measures I ask to be allowed, on my own behalf and on behalf of those I have been elected to represent, to register our considered and solemn protest. It rests not only on our inveterate antipathy to all projects involving class distinction as unjust to the individual, but on our deep conviction that such measures will weaken and impair the solid loyalty of a large community, itself based on the thankful and inspiriting recognition that the mission of England here, at least, and where the influence of the Crown must for long years to come remain paramount, is to enforce an unswerving impartiality of treatment to all her subjects in the view that it is "Righteousness alone that exalteth a nation."

Mr. H. W. Biggie called and examined.

70135. (*Chairman.*) The witness was an officer in the Provincial Survey Department. The Anglo-Indian Association was composed of members of the domiciled community in India, its object being to watch their interests apart from political motives. There were about 30 members of the Provincial Survey Department, out of a total of 130, who were members of the Association.

70136. One reason why, in his judgment, the Survey organisation should be drawn from sources other than that of the Army, was precedent. The Survey Service used to consist of Civil Assistants, and men recruited from the Army, and, formerly, a certain number of appointments in the old senior division was open to members of the junior division. Those divisions represented at one time the Imperial and Provincial branches of the Department. Promotions to the Imperial Service had ceased on the introduction of the division of the Service into Imperial and Provincial. The Civil element were confined to the Provincial branch of the Department, and the Military occupied exclusively the posts in the Imperial branch, the mathematical expert on salary by special agreement being the only exception.

70137. He would specify spherical trigonometry, conic sections and co-ordinate geometry as additional subjects in the syllabus of examination for admission to the Department. If those subjects were added there might be a danger of the Indian candidate being more successful than the Anglo-Indian candidate, but he would have a limit of selection as between the two classes. Hitherto, the rule had been one Indian in four vacancies. He was perfectly sure, however, that the Anglo-Indian would be quite ready to qualify in the more severe test he had laid down. Why he suggested the limitation as between the Anglo-Indian and the Indian was that Anglo-Indians would like a fair share of the appointments.

70138. He drew attention to the great disparity which existed between the salary of a Provincial Officer and an Imperial Officer. It was less, on an average, than two-thirds of the pay of the Imperial Officer. He would not admit that the work of a Provincial Service Officer was not of the same value and responsibility as the work of an Imperial Officer in the same position. He recognised, however, that an officer appointed from Europe should be paid on a higher basis than the officer recruited locally.

70139 The proposal he made for promoting a certain number of Provincial Officers to the Imperial Service would necessitate a decrease in the number of Royal Engineer Officers. In order to overcome the difficulty of a war reserve, he would suggest that Military Officers should join the Department on tours of five or ten years' service at a time. That was the recommendation of Sir John Farquharson in 1905. He agreed that that was a matter which would have to be determined by the Military authorities. He did not agree with the suggestion that the best organisation for the Survey Department would be to provide for a directing staff consisting wholly of Royal Engineers, of an upper subordinate staff consisting, in the higher ranks, of officers in charge of camps, and, in the lower ranks, of officers employed in the less important triangulation work, and finally of a lower subordinate Service.

70140. There were seven executive posts allotted to the Provincial Service, three of which were drawing office posts, which had not the same responsibility as the charge of field parties. Those posts had always been held by the Provincial Service; it was merely the designation that was changed. They were never executive posts, but when the Government allotted seven executive posts to the Provincial Service, three drawing offices were brought in to make up the seven. His Service would like from about one-fourth to one-third of the number of executive posts as against the present proportion of one-seventh. He agreed that the final allocation would have to depend on the exigencies of the Military organisation, but urged that the just claims of the Provincial Service should also be considered.

70141. He maintained that the Survey Service had always been a Civil Department, and was in no sense a Military Department.

70142. (*Mr. Madge.*) The training given to men after they joined the Survey Department was the same for both branches of the Service.

70143. He had given in the written statement the names of men who would now be called Provincial but who did as important work as had ever been done in any branch of the Department. There was no reason to suppose that the efficiency of the uncovenanted men was lower now that it was formerly.

70144. He thought that the salaries of the Imperial Service were excessive; certainly the initial salary of the recruit was excessive. The pay of the Provincial Service was not equitable. Even a two-thirds scale of salary for the Provincial Service would be excessive, because it would be based on the present excessive salaries paid to the Imperial branch.

70145. Until 1st March, 1913, officers of the Provincial Service were not employed on executive duties in the way they used to be. That privilege had to some extent been restored.

70146. To his knowledge there had never been any question of a war reserve from the Survey Department, nor was the question of a war reserve mentioned anywhere, either in the constitution of the Department, in its history, or in any single annual report.

70147. With regard to the proposal to recruit the subordinate Service from privates in the ranks, he represented that about 30 or 40 years ago a few Military men were brought into the Provincial branch of the Department, and within the last five or six years two non-commissioned officers had been imported from Southampton. After spending about three years in the Department, they reverted to their work in England. In his opinion the general education of soldiers was not above the level of the education of the men who entered the Survey Department.

70148. At present there were about 21 field parties, about 17 of which were under the executive control of military officers, and the remainder under Provincial Officers. There were generally

two military officers in each party. Colonel Longe's object was that in case the controlling senior officer went on leave, the officiating charge thereby falling vacant would be filled by the assistant military officer. Cases had occurred where uncovenanted officers had taken charge of parties for short periods. He did not know of any case where such a man had been reported on for inefficiency.

70149. (*Mr. Fisher.*) He did not consider the three years' probation too long.

70150. There were at present members of the Provincial Service in the Department who were qualified to fill one-fourth, and more, of the Imperial posts. He had had himself to undertake important work without the supervision of an Imperial Officer of the Survey of India. He was on important work in Burma as Superintendent of Land Records. That post gave him great scope for initiative. He was under the Deputy Commissioner for Land Records, and under the Settlement Officer for Settlement Records, but not under an officer of his own Department.

70151. (*Mr. Sly.*) Royal Engineer Officers in the Survey of India Department did form a portion of the war reserve.

70152. With regard to the standard of education amongst soldiers, he had only met two non-commissioned officers of the Royal Engineers.

70153. He admitted that at present Provincial Officers of the Service held seven charges out of 28. The objection to that was that three of the charges were drawing office appointments, which he did not look upon as executive posts. He desired seven executive posts in addition to those three.

70154. In the days when the Service was divided into senior and junior divisions, the maximum salary of the junior division was Rs. 500, whereas the present maximum salary was Rs. 800, with charge allowance of Rs. 200. He could not say what was the largest number of men at any one time who had been promoted to the senior division. He pointed out that in former days the Provincial Service occupied 12 out of the 50 senior appointments in the Imperial Service and had a better status. The division of the Service into Imperial and Provincial involved a distinct lowering of status.

70155. He was of opinion that the surveying which the Royal Engineer learnt before he joined the Department did not fit him for employment in the Survey of India. He was not prepared to say that the surveying standard at Rurki was as high as the surveying standard at Chatham.

70156. At present, admission into the Service was by a competitive test, and a European wishing to enter the Service must have passed his high school examination. If the educational test was raised by the inclusion of the three subjects he had mentioned, he was perfectly willing to concede half the appointments to Indians. He was only following the policy of the Government in that respect. He also justified the policy on grounds of physique. He thought Anglo-Indians were more adapted to work in the Survey of India than the native of India. Even if Indians came up to the physical test, he would still limit them to one-half the number of appointments.

70157. (*Chairman.*) He would not admit that all three Drawing Office posts carried the pay of executive posts. It was very hard to answer the question whether the pay attached to those posts was sufficient. The survey question was bristling with difficulties. There were three men doing the same work on three different rates of pay. This was due to their having rendered different periods of service. The posts were quasi-executive; their powers and duties were capable of enlargement. If that were done the highest-paid man might remain where he was and the salaries of the other two might then be increased. He thought the highest-paid man was certainly drawing too much for the work at present in a drawing office. The work should go to a junior man, and the man at present holding the post should be advanced to a more responsible position, for instance, a field party. The second man was drawing a salary about commensurate with his duties; and he would say the same of the third man.

(The witness withdrew.)

At Calcutta, Friday, 23rd January, 1914.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

SIR VALENTINE CHIROL.
WALTER CULLEY MADGE, Esq., C.I.E.
FRANK GEORGE SLY, Esq., C.S.I.
HERBERT ALBERT LAURENS FISHER, Esq.
R. R. SCOTT, Esq. (*Joint Secretary*).

COLONEL S. G. BURRARD, C.S.I., R.E., F.R.S., Surveyor-General, Survey of India Department.

Written Statement relating to the Survey of India Department.

70158. *INTRODUCTION.*—The organisation of a Survey Department must depend upon the work in front of it.

The main work of a Survey Department may be broadly divided into two classes (i) Topographical Surveys (small scale), (ii) Property and Engineering Surveys (large scale).

The Triangulation and Levelling upon which the Topographical maps are based are included in the first class.

The primary object of a Topographical map is Military. Topography is a Military Art, and owes its origin and progress to Military requirements. It is for these reasons that the Topographical Departments of all the nations of Europe are controlled by Military Officers.

The large scale Surveys (property) are those required for Revenue and Engineering purposes, for the demarcation of properties, for the use of City Corporations, Cantonment Magistrates and Forest Officers.

The reason that property Surveys have come to be controlled in England by Military Officers is that Military Officers were required for the Topographical Surveys and it has been considered advisable to have all Surveys executed by one Department.

The difficulty confronting Survey policy in India has been that the (small scale) Topographical Maps have been an Imperial work paid for by the Supreme Government and the (large scale) property maps have been paid for by the Local Governments.

The Government that pays for a work wishes to control it and to appoint the Supervising Officers.

Many attempts have been made during the last fifty years to bring the Topographical and Property Surveys together and to avoid duplication of work, but no successful system has been devised. Survey policy has in consequence undergone repeated changes. If the number of Officers employed on Survey work in India is required to be ascertained, it will be necessary to include not only officers of the Imperial Survey Department, but all those recruited by the several Local Governments.

Mr. Petters in paragraph 9 of his memorandum* gives figures to show that the number of Provincial Officers has been reduced between 1886 and 1909 from 135 to 87, and that the Domiciled Community has suffered in consequence. But I cannot accept his conclusions.

In 1886 considerable large scale surveys were being carried out by the Survey of India Department. Subsequently these Surveys together with the Provincial Officers supervising them were transferred to Local Governments; no comparison is therefore fair unless account is taken of Provincial Officers serving under Local Governments.

Even now in 1913 there are still 160 Provincial Officers on the List of the Survey of India Department, and if to these be added the Provincial Survey Officers recently recruited by the Burma Government and the survey supervisors recently recruited by the Bengal, Bihar and Assam Governments it will be found that the alleged reduction from 135 to 87 has not taken place.

Until a satisfactory scheme has been devised it is impossible to take a comprehensive view of Indian Survey work as a whole. In considering the organisation of the Survey Department I have to assume that the work before the Department is merely what it is at present, namely the Topographical programme.

I have to assume that Local Governments will continue to have their own little Survey Departments.

If property continues to increase in value as it is doing at present, there will have to be in the future many new large scale surveys in all parts of India; and according to the present system these will be carried out under Local Governments and not by the Survey Department. Personally I think that the limitation of the Survey Department to Topographical surveys will prove a mistake. An Imperial Survey Department ought not to be divorced from property surveys, but as the policy of limitation has only recently been adopted, I have to accept it as the basis of this memorandum.

70159. **(I) Methods of Recruitment.**—*Imperial Service.*—As the work of the Survey Department is limited to Topographical Surveys, I consider that it should be mainly controlled by Military Officers, who understand the strategical and tactical purposes for which maps are required.

The best training schools for Topography in the British Empire are the Military Colleges of Chatham, Woolwich and Sandhurst. Military Officers employed in the Survey Department form part of a reserve for the Army in war, a reserve that is usefully employed during peace.

India has large transfrontier areas unsurveyed, and its army when crossing the border needs many trained Survey officers. The Survey Department is a training school for war.

Whilst it is advantageous to keep the bulk of the Imperial service Military, I think the old plan of promoting 7 to 10 selected Provincial Officers into the Imperial Service was a sound one. This plan was abandoned in 1891, and I should like to see it re-introduced. Officers so promoted should be allowed to rise to salaries above Rs. 1,000.

The Mathematical Experts of the Imperial Service have never been Military officers.

Provincial Service.—Having regard to the work for which the Provincial Service is required, I think that the present system of recruitment by Departmental Entrance Examination is satisfacory.

The main work of the Provincial Service is the charge of "Sections" of Parties, and the majority of Provincial Officers perform this duty satisfactorily. Doubtless the examination allows a few inefficients to enter, whilst on the other hand we obtain a few exceptionally competent men.

Whilst it is desirable to recruit the bulk of the Provincial Service by means of our Entrance Examination, I think the old plan of promoting a few selected Subordinates from the Service below was a good one.

Many Provincial Officers object to the promotion of selected Subordinates into the Provincial Service, but I think an exceptional man in any Service should have the opportunity of rising into the Service above.

When I consider the excellent services rendered by such Provincial Officers (who were promoted from the Subordinate Service) as the late Khan Bahadur Yusuf Shareef and Rai Bahadur Hira Singh, I think it would be a mistake to close the door against promotions from the Subordinate Service to the Provincial Service. If we are to judge of the success of a system from the individual cases of promoted officers, then the promotion of Officers from the Subordinate Service to the Provincial Service has certainly been as justified as promotion from the Provincial Service to the Imperial Service.

70160. **(II) System of Training and Probation.**—*Imperial Service.*—The Royal Engineer Officer is so well grounded at Chatham, both in the theory and practice of Geodesy, Topography and Field Astronomy, that when he joins the Survey of India Department he is not so much in want of technical education as experience of Indian ways and methods.

The school authorities at Chatham keep the Indian Survey informed of the names of young Royal Engineer Officers who show the greatest aptitude during the Surveying Courses.

The Indian Army Officer passes one year at Sandhurst (or two at Woolwich) and is thus not so trained a Topographer as his Royal Engineer colleague, but the Survey of India Department recruits so few of its officers from the Indian Army (only one in four) that it would be superfluous to create a training school for them. No Indian Army appointment to the Survey of India has been made during the last three years.

I consider that the present system of training and probation for the Imperial Service is satisfactory.

Provincial Service.—The training of Provincial Officers must depend upon the work for which the Provincial Service is required. Hitherto their training has been satisfactorily carried out at the Survey School at Dehra Dun.

To make all officers pass through lengthy and varied courses with all Survey Parties, as has been proposed by some Provincial Officers, would dislocate the work of the Department and would convert the Department into a big training school.

This miscellaneous technical training would be no groundwork of education and would be actually detrimental to the formation of character.

The object of Government in creating a Provincial Service is to get certain work done and not to train officers for other work.

70161. **(III) and (IV) Conditions of Service and Salary.**—*Imperial Service.*—This Service has only recently been reorganised, upon the recommendations of the Survey Committee of 1905. The grant of time scale salaries has removed the block in promotion.

Provincial Officers draw attention to the fact that the pay of the Imperial Service is so much greater than their own.

The pay of the two Services has been fixed independently of each other. The pay of the Imperial Service has been fixed so as to attract men of a certain educational standard, and the pay of the Provincial Service has been fixed so as to attract men of a different educational standard. The pay of the Provincial Service is ten times as great as the pay of the Subordinate Surveyors, who carry out the actual surveying in the field. This disparity appears at first sight very great; but the pay of these Services has been fixed independently of one another, as men of different educational standards have been required.

* Not reprinted.

In 1907 the Secretary of State recruited a Cambridge Wrangler on special terms, decided upon in England by the India Office, and those terms are much the same as the time scale pay granted to the Military Members of the Survey of India.

Provincial Service.—Anyone reading the Provincial Officers' notes might think that the Provincial Service was discontented to the core, but this is not the case. Retired Officers are most anxious to obtain appointments in it for their sons.

In 1908 I went into the whole Provincial question with a Provincial Committee. In 1910 the Provincial Officers memorailized the Government and a Committee was appointed which took exhaustive evidence. Neither in 1908 nor in 1910, neither in the memorials nor in the evidence was any proposal made, such as has now been put forward, to transfer all Provincial Officers to the Imperial List.

The foundation of any Department is the work to be done. The Provincial Service was created to do certain work for Government; the nature of that work is now for the first time made a grievance.

When grievances concern promotion, pay, or leave, they can be remedied; but when a service objects to the nature of the work for which it was created, there is no remedy.

If the memorials submitted and the evidence taken in 1910 are examined, it will be seen that most of the Provincial Service grievances have been fairly redressed.

The recent reorganisation has granted an extra lakh of rupees per annum to the Provincial Service.

In 1910 there were two principal grievances:—

(i.) The omission to give them a time scale salary.

(ii.) The denial to them of executive charges.

In their memorials of 1910 they asked Government to grant them a time scale and to allot to them five executive charges.

In 1912 Government granted these requests, giving seven charges instead of the five asked for; in addition to these concessions horse transport and free tents have been allowed, and the prospects of pensions have been greatly improved.

I consider that seven executive charges for the Provincial Service should now be sufficient. When these new executive posts were first filled up, several officers had to be passed over as unqualified, although the tests were not very severe.

I have however to acknowledge that the regulations, by which the time scale salaries were granted, fixed the dates of increase in such a way that some officers benefitted less than others. Men are greatly influenced by comparisons, and I should like to see all officers get their time scale from date of appointment.

During the hot weather, Survey Officers reside in hill stations, the expenses of which are put forward as a grievance.

Although house rent is expensive in hill stations, yet a man does save money there, in not having to send away his family during the hot weather and in having schools handy. Many Provincial Officers, when they retire, settle from choice at hill stations, and I feel certain that if survey recess quarters were to be transferred to the plains there would be much lamentation.

It is difficult to obtain a fair comparison between the pay and prospects of two different Departments; on page 5 of his note Mr. Greiff compares the prospects of the Survey with those of the Public Works and Forest Departments.

In the Public Works Department and in the Forest Department students spend some years at a College, before they receive their initial pay of Rs. 250. During the periods at College they receive no pay at all.

The survey recruit does not pass through any College; he is appointed direct to the Survey Department but kept for 3 years "on probation": during this probationary period he receives a salary of Rs. 100 to Rs. 150, and at the close of it he starts on Rs. 250.

I should have thought that in any comparison the probationary period of the Survey ought to have been set off against the College period of the other two Departments and in favour of the former; but Mr. Greiff argues that the Public Works Department recruit begins on a salary of Rs. 250, whereas the Survey recruit begins on Rs. 100.

In my opinion the comparison should be thus:—

	P.W.D.	Forest.	Survey.
College and Training period	No pay.	No pay.	Rs. 100-150
1st year	Rs. 250	Rs. 250	Rs. 250
10th year	„ 475	„ 450	„ 400
16th year	„ 675	„ 550	„ 500
Maximum pay attainable by time scale	Rs. 850	Rs. 550	Rs. 600
Maximum pay attainable by selection to higher appointments	Rs. 2,000 (?)	Rs. 850	Rs. 1,000

The Public Works Department is on a different level of education to the Forest and Survey Departments.

In some respects the terms of the Forest Department may be better than those of the Survey Department, but in other respects they are less favourable.

I doubt if in my table above the advantages of the Survey Department have even now been sufficiently demonstrated; for the probationary periods on low pay in the Public Works Department and in the Forest Department have been omitted; but I have said enough to show that Mr. Grieff's comparison is not a fair one.

70162. **(V) Conditions of Leave.**—*Imperial Service.*—The leave rules are sufficiently liberal, but owing to constant modifications have become too complicated.

Provincial Service.—Provincial Officers are statutory natives of India, and therefore come under the Indian leave rules;—these rules do not allow the same amounts of long leave to be taken as the European leave rules.

Although Provincial Officers do not often take long leave, several of them think that the European and Indian leave rules should be the same.

The difference between the European and Indian rules was originally introduced on the grounds that the European had to go to Europe to visit his home and his relations, whereas the statutory native has his home and his relatives in India and consequently long leave is no more necessary to him than it is to an English Officer serving in England. When a man wishes to enter the Provincial Service, he is willing to accept the position of a statutory native, because as a European he would be debarred. When he is in the service he claims the leave privileges of the European. In this connection difficult cases occasionally arise; as I stated above, the Provincial Officer with his family is supposed to be domiciled in India, and his salary and his leave have been based upon this supposition. But in certain cases the Provinical Officer nobly strives to advance his children's interests; at great personal sacrifices he sends them to England for education: and he thus practically ceases to be a statutory native. He has in fact accepted leave rules which are no longer applicable to his changed condition. Such cases evoke admiration and sympathy. At the same time I cannot agree with Mr. Petter's suggestion that all Provincial Officers should be allowed long furlough on full pay.

To offer the same pay for furlough as for duty will be an inducement to men to take all leave whether they want it or not.

I think that three years' furlough during a man's service might be allowed, and that privilege leave should be allowed to accumulate up to six months.

I think that cases of sickness, which are obviously due to survey work in unhealthy localities, require very generous treatment under the leave rules.

To officers drawing less than Rs. 500 a month the Surveyor-General should be empowered to grant special medical leave on full pay up to three months when he is convinced that the sickness is due to the work and the work alone.

70163. **(VI) Conditions of Pension.**—*Imperial Service.*—The pensions are governed by the military regulations.

Provincial Service.—Provincial Officers should be given the option of retiring on full pension after completing 25 years service without medical certificate.

70164. **(VIIA) Limitations in the employment of non-Europeans.**—The efficiency of the Survey Department has not suffered by the appointment of Indians to the Provincial Service.

Nothing however will be gained by attempting to make comparisons of the respective merits of the Europeans and Indians of our Provincial Service. It is the individual that counts, not his class. The individual counts more than the class.

So many instances of courage and endurance on the part of both Europeans and Indians have occurred in trans-border work of the Survey Department that no Surveyor-General will be willing to seek out and emphasise their relative defects.

70165. **(VIIB) The working of the existing system of the division of the Services into Imperial and Provincial.**—The different Departments of the Indian Government have been developed on different lines, and it was, I think, a mistake in 1895 to attempt to give the same organisation to all. One defect of the existing system is that the term "Provincial" is applied in different Departments to men of different educational qualifications.

In the early days of the Survey Department the supervision of field work was carried out by military officers, whilst the actual surveying was done by a subordinate Service recruited from the domiciled community. After this system had lasted for many years, the necessity of reducing expenses led to a third Service of Indians being recruited.

The Military Service (now the "Imperial") became the controlling staff; the Subordinate Civilian Service (now the "Provincial") became the supervising staff; and the third Service became the working staff. The main purpose for which a Military ("Imperial") Officer is now recruited is to hold charge of a Survey "Party"; in the earlier years of his career he is gaining experience as an Assistant and in his latter years he may be a Superintendent, but the principal work of his life is to hold executive charge of a "Party."

The Civilian Officer, formerly called Subordinate (now Provincial). is recruited to hold charge of a "Section" of a party; that is the work for which he is wanted.

In the latter part of his career he may rise to hold charge of a party.

Owing to the dislike of the Provincial Officers to the term "Subordinate Service," which was their original designation, the latter was altered in 1885 to "Junior Division." But no change in duties was introduced; the "Senior Division" (Imperial) remained the superior Service and the "Junior Division" remained subordinate as before.

On the recommendation of the Royal Commission of 1887 the name "Senior Division" was changed into "Imperial Service" and the name "Junior Division" was changed into "Provincial Service." Again no change was made in their relative duties, the Provincial Service remained subordinate.

Of recent years complaints have been made by Provincial Officers that they are occasionally called "subordinates," and these complaints are justified; according to official designation the Provincial Service is not now a subordinate Service, although it is still recruited for subordinate duties. By the accidental use, however, of the term "subordinate" no slight has been intended; the term is merely a relic of the time where the Service was officially designated "subordinate"; in the present handbook of the Government of India Orders, Provincial Officers are termed "subordinates," and as late as 1891 the Secretary of State referred to them as such.

When in 1895 the names "Imperial" and "Provincial" were introduced the former was intended to include all officers educated in England and the latter those educated in India. The plan has not been satisfactory, because the relative responsibilities allotted to "Provincial" Services have varied in different Departments.

In the Public Works Department the Imperial and Provincial Officers are employed on identical duties. In the Civil Service and in the Survey Department the Provincial Officers are recruited for subordinate duties. This is, of course, the reason why the Survey Department has always been allowed such a very large number of Provincial Officers; in the Public Works Department the number of Provincials is only one-fourth of the number of Imperial Officers; in the Survey Department the number of Provincials is three times as great as the number of Imperials.

Because of their designation "Provincial" some of the Provincial Officers of the Survey Department have argued that they should be treated like Provincial Officers of the Public Works Department; but the work of the Department does not admit of this claim being conceded, and if education is to be recognised as a standard, or if the expenses of education are taken into account, then the Provincial Officers of the Survey have no claim to equality with those of the Public Works Department. To grant them equality would be unfair to the Rurki students, both to those who have passed into the Public Works Department and to those who have failed; it would mean that education is not to be the test of qualification in India.

Survey appointments to the Provincial Service are gained by competition in a small Departmental examination, the subjects being elementary mathematics and elementary drawing. The examination is in no way comparable with those at Roorkee. The Survey examiner has been continually instructed by the Surveyor-General to make the papers easier.

The Survey Department has been founded upon a Military basis for particular Military reasons; no secret has been made of this, and applicants and their parents are quite aware that the Department is organised differently from the Public Works Department.

In interviews with parents of candidates I have sometimes said, "our Provincial Officers complain that their status is inferior to that in the Public Works Department. Why don't you send your son into the Public Works Department?" the following replies have been given to me:—

(i.) "I am afraid my son would not pass for the Public Works Department."

(ii.) "I cannot afford to pay Rs. 4,000 for my son's course at Rurki."

(iii.) "If my son passes the Survey entrance examination he is sure of an appointment; whereas, after three years at Rurki he is not even sure of any appointment in the Public Works Department."

If the Public Works Department standard of education had been insisted on for the Survey Department, very few indeed of our present Provincial Officers would have been able to gain admission.

It has been argued that the name "Provincial" in the Survey is a misnomer, and that as the Survey Provincial Officers are liable for service in any Province they should be called "Imperial." But if this claim is correct, then the lower subordinates of the Survey have also a right to be called Imperial; for every member of the Survey Department whether Imperial, Provincial, subordinate or menial is liable for transfer from Province to Province.

Objections have also been taken to the word "extra" in the designation "Extra Assistant Superintendent," and Provincial Officers have argued from the dictionary meaning of the word

"extra" that it is not applicable. But the dictionary meaning is not the point at issue. The designation "extra" denotes that a Provincial Officer has not qualified at Rurki, that he is "extra" or outside the Rurki List. Discussions of the dictionary meanings of the words "Provincial" and "extra" are irrelevant, for the real question at issue is whether the Provincial Officer of the Survey possesses sufficient education to justify him being granted equality with the Public Works Department and with the Imperial Service. I do not argue in favour of retaining the exact words "Provincial" and "extra"; better dictionary substitutes may possibly be found for them, but no substitutes will satisfy those Provincial Officers who are claiming equality with the Imperial Service. Equality is not a matter of nomenclature; it is a matter of education.

Mr. Petters has stated in his note (para. 13), that on entering the Survey Department the Royal Engineer and the Provincial Officer are on a par.

The Royal Engineer is selected as follows:—

Senior boys of the public schools of England compete for admission into Woolwich; about 50 candidates are successful, and these (even when they enter Woolwich) have an education very superior to that of the Provincial Officer. At Woolwich they undergo two years of hard study; there is then a final examination and out of the original 50 successful candidates only 15 are appointed to the Royal Engineers. These 15 are then sent for two years to one of the best schools in the world, the School of Military Engineering at Chatham. According to Mr. Petters the schools of India are able to turn out boys (aged 19) who are as well educated as those (aged 24) who have been at the head of English Public Schools, and who have subsequently passed four years at Woolwich and Chatham. Mr. Petters' comparison obliges me to say that in my opinion the education of the Provincial Officer is altogether inferior.

Mr. Petters states that on joining the Survey Department no Royal Engineer Officer can do topography, triangulation or traversing. Every Royal Engineer Officer has studied these subjects for four years at Woolwich and Chatham and every Royal Engineer Officer first joining in India is competent to carry out any ordinary Survey work. The Commandant of the Chatham School may be asked his opinion on the subject. It must be remembered that India is not the only country that is being surveyed by Military Officers from Chatham. Large areas of Africa have been recently surveyed by Royal Engineer Officers who have never been trained in the Indian Survey.

A few Imperial Officers of the Survey are recruited from the Indian Army; some of these have passed into the Royal Artillery through Woolwich, other into the Infantry through Sandhurst. The entrance examination to Sandhurst is a more severe test than the entrance examination of our Provincial Service; it embraces such additional subjects as geography, history, modern languages and science.

In my opinion the Indian Army Officer joining the Survey is very superior to the Provincial Officer in education.

Even the Anglo-Indian Association admits that if Provincial Officers are to be placed on the Imperial List their educational qualifications will have to be "considerably raised" (*see* Association's Memorandum).

An article published in "Indian Engineering," 5th April, 1913, which has been quoted by Provincial Officers and which presses the claims of the Survey Provincial Service to equality with the Imperial, ends with the remark, "To attain this equality of status Indian men must consent to acquire a higher 'hall mark.'"

The proposals to transfer 160 Provincial Officers to the Imperial List and to double their pay all round are not based on any considered scheme of reorganisation.

Provincial Officers are mainly employed in charge of "sections" (the seniors being in charge of "Parties" or employed in Drawing Offices or Headquarters). Mr. Petters thinks that charge of a section is a subordinate duty and so he proposes to educate 160 Provincial Officers at Government expense, paying them their full salaries during their course of 11 years training in order to make them fit for charges of Parties which do not exist. Mr. Petters says that new parties ought to be created, but parties can only be created to do work that is required; we cannot create posts and parties in order to provide higher salaries. We cannot create posts for Cadastral and Forest Survey expansions before those expansions have taken place.

Mr. Greiff starts from the Provincial Officers for whom he wishes to find more highly paid posts, instead of starting from the work to be done for Government. Whilst Mr. Greiff is proposing to transfer 160 Officers into a small Imperial Service he does not face the questions:—

(i) How can 50 Imperials and 160 Provincials be organised for the charge of 28 Parties.

(ii) Who are to replace the numerous Officers now in charge of sections?

I doubt if Mr. Greiff's proposals are even in the interests of the Domiciled Community. The old Provincial Service has hitherto been a valuable monopoly (three-quarters of its posts being reserved) for that section of the Domiciled Community who have been unable to afford the higher Roorkee education.

It is this service that Mr. Greiff is now proposing to destroy. Mr. Newland sees the logical conclusion and says that the Provincial Service will have to be allowed to die out. If a Service objects to performing the work for which it was created, it must inevitably be replaced by some other Service.

The argument has been pressed that when Provincial Officers have been promoted to the Imperial Service a few have held their own with Imperial Officers; stress for example has been laid upon the case of Mr. Hennessey, who rose to be Deputy Surveyor-General in 1884.

There is, however, an important fact about Mr. Hennessey which has not been mentioned; namely, Mr. Hennessey when quite a young man took three years' furlough, partly on no pay, and underwent the whole course of mathematics at Cambridge University. He is the only Provincial Officer who has done this. The conclusion to be drawn from his case is, that if a young, hard-working, Anglo-Indian is educated at Cambridge University he may become a useful Imperial Officer. The conclusion commonly drawn from this case is that as one Provincial Office rose to be Deputy Surveyor-General all others are equally qualified. Exceptional Officers exist in all services, but we must not generalize from them. Several Provincial Officers selected for important charges have completely failed; to condemn the whole service from such instances would be unfair, but it would be equally unfair to appraise them all at the value of Mr. Hennessey.

I think that the charge of a few Survey Parties, if the latter are in good working order, and have a normal programme, may be entrusted to selected Provincial Officers; and although heart-burnings in the Provincial Service are created by supersessions and selections, I think that the reservation of some charges for the best men of the Provincial Service will have a good effect. The Government has recently granted seven executive charges, and five non-executive charges to the Provincial Service. The scheme is on its trial and in my opinion no further step in this direction is justified.

A University can give a few honorary degrees in recognition of approved service; but if it is unduly generous in conferring its ordinary degrees, it will only depreciate their value.

Promotions to the Imperial list of selected seniors can be given as prizes for approved service, but wholesale promotions should only be given to mark a certain educational standard.

In the Survey numerous cases arise for which an Imperial Officer is indispensable. The Department has only just started a topographical survey of the Deccan on half the normal scale; if this experiment proves successful, a large sum of money may be saved. But initial control by an Imperial Officer is

desirable in any such departure from normal routine.

Following America and Russia we are trying a new system for measuring base lines; the apparatus is now being tested. No Provincial Officer could do this work, none has the knowledge of physics; although when once a satisfactory method has been worked out, Provincial Officers will probably be able to take the routine observations, as they can now do in magnetic work.

When a special survey and map of the Delhi country was required last year by Government at three weeks' notice, so much push and initiative were necessary that the nomination of a Royal Engineer Officer to the charge was imperative. In such an emergency a sense of proportion is wanted and a power of rising above the ordinary technical methods.

When last year a new map of Persia became necessary the work had to be given to an Imperial Officer. This map will have to face the criticisms of geographers and diplomatists in Europe. It had to be compiled partly from the maps of foreign explorers whose reports were written in foreign languages. I know of no Provincial Officer who possesses such a knowledge of German and French as would enable him to reconcile and adjust the contradictory results of different travellers.

Last year I was asked to depute "an Imperial Officer" to demarcate the boundary of Nepal; the demarcation had been previously done by a Provincial Officer who had failed to realise the importance of the work. On this occasion I was particularly asked to send "an Imperial Officer," and I have to say that the demand was justified.

When last year the City of Bombay pressed me to send them "an Imperial Officer," I offered to select for them one of the best Provincial Officers in the Service. The city had had recent experience of the work of a Provincial Officer and it now specially asked for a Royal Engineer Officer. Although I do not think that an *average* Provincial Officer could be entrusted with the survey of a great city, I think that a Provincial Officer might be specially selected who would be competent to undertake it.

The business routine, the accounts and the correspondence of the Survey Headquarters are managed by a young Royal Engineer Officer; this Officer could be replaced by other Imperial Officers, but I know of no Provincial Officer who could take up his work.

Further instances might be given, but I think I have said enough to show that the proposal to transfer the whole Provincial Service of 160 Officers to our small Imperial List and to double their pay is not one that can be accepted.

When I think of the cordial relations generally existing amongst all ranks of the Department, and of the excellent and loyal work of many Provincial Officers, I deeply regret that the extravagant demands of a few should have compelled me to enter into these invidious comparisons.

70166. **(VIII) Relations with other Services.**—The relations with the Indian Civil Service and other Services have been good.

COLONEL S. G. BURRARD called and examined.

70167. (*Chairman.*) The witness had been in the Survey of India Department for 30 years. He was satisfied with the arrangement under which one-fourth of the vacancies in the Imperial branch were allotted to Indian Army Officers. The war reserve of Royal Engineers for the Army of India was very much larger than any number of officers whom the Survey Department could employ. The Government desired to employ just as many Royal Engineer Officers as they could on useful work in peace time. The Survey Department employed 37 to 38 Royal Engineer Officers in that way. Royal Engineer Survey Officers acted as military engineers as well as Survey Officers in time of war. The cadre required for survey purposes in the event of war was governed by the magnitude of the campaign, and that was a matter for the Military authorities.

70168. There were some 50 Imperial Officers at present in the Survey Department. Six Imperial Officers were filling the higher administrative posts and 21 were executive officers holding major charges. Ten was the allowance for furlough; there were therefore only 14 assistants for 21 executive charges. In 1912, 9 military officers were on trans-frontier military service, and there were only 5 assistants for 21 charges. This year 2 officers were surveying the Persian frontier, 1 was with the Indian expedition in Turkistan, and there were only 11 assistants. Provincial Officers were not available for the Persian or Italian expeditions, as a knowledge of French was required. In 1905 the Director-General of the Ordnance Survey of England, who had been called in to advise the Government of India, represented that the service required 70 military officers for survey purposes in time of peace, and Sir John Miller who was on the Committee, said he thought 64 military officers would be sufficient, and that five charges should go to the Provincial Service. The Government of India cut the number down to 55, and had now further reduced it to 51. He was of opinion that further reduction was impossible.

70169. It was not necessary to have an assistant to every charge, but there must be young officers always coming on, gaining experience of India, and of survey work. He justified the position of the assistant in that he was gaining experience to qualify him for employment as an executive officer. The existing number of assistants was not in excess of the number required for training. An Imperial Officer should normally serve six years before becoming qualified to take charge of a party. This applied equally to the Royal Engineer and to the Indian Army Officer.

70170. The reason why the Survey Department in India differed in its constitution from Survey Departments in other parts of the world was simply policy. If he only thought of efficiency he would recommend that the controlling staff should be a purely Military service.

70171. It was very difficult to express an opinion on the suggestion that the upper subordinate service, if carefully recruited and trained, might be found competent in due time to replace a large portion of the Provincial Service. The upper subordinate service was quite in an experimental stage, and the salaries offered were not sufficient to attract the class of men required. If there was only one intermediate service between the military and the subordinate, it would have to approximate in pay and education to the present Provincial Service. He did not see how it was practicable to get rid of the Provincial Service; there must be an intermediate service. He did not endorse the view that the Provincial Service as now constituted was a fifth wheel on the coach. He would rather say the upper subordinate service was the fifth wheel on the coach.

70172. He would not agree to the suggestion that the present number of executive charges allotted to the Provincial Service should be increased to 11. Seven should be the maximum number. Nor did he agree with the opinion that of the seven allotted posts, the three drawing office appointments were inferior. He should be very glad to see three Imperial Officers in charge of those particular appointments. The work attached to them was just as important as that attached to other Imperial posts. He thought the only reason which could be offered for such a suggestion was that it provided an excuse for asking for three more charges.

70173. He had always been in favour of promoting a few officers of the Provincial Service into the Imperial Service, as used to be the case. He believed in promoting men from the Provincial Service straight into the Imperial Service. He

did not like the system under which the two services overlapped. The old system was quite a good one. A man got to the top of the Provincial Service, and then, if he was fit, was promoted to the Imperial list and entered at the bottom. When the old system first came into force, the method of promoting men was to choose young officers of 24 and 25 from the Provincial Service, and promote them into the Imperial, with the result that those young men had the opportunity of rising very high. That system, however, created such discontent in the Provincial Service that it had to be abandoned. It was pointed out that if a young officer was promoted, no one but the promoted officer got any advantage, whereas if a senior officer got promotion, it meant an increase of pay all round. On the whole, if men were to be promoted to the Imperial Service from the Provincial Service, he would prefer to promote the fully qualified long service officer at the top of the Provincial Service. He did not think that the promoted officer would find himself in an invidious position through being ranked for seniority below a junior officer of the Imperial Service. That was a pure matter of administration. The two officers should be kept apart so that there could be no question of one of them giving orders to the other.

70174. The present system, which provided for charge allowances, and a continuous time-scale for Superintendents, Deputy Superintendents and Assistants, was inconvenient and led to a great deal of trouble. What was wanted was an incremental scale of pay for the Deputy Superintendents, and another scale for the Assistant Superintendents, with promotion by selection from the Assistant class to the Deputy class. There was no need to abolish the system of charge allowances in the case of the Superintendents, as there were so few of them.

70175. He recommended that Provincial Officers should be allowed optional retirement after 25 years of service, because of the rigorous nature of the department. Most men in the service when they reached 45 were too old for field work, and there was not enough room for them in the Drawing offices. He did not think that many officers would take advantage of the option.

70176. (*Sir Valentine Chirol.*) With regard to the statement that Indian Army Officers never heard of the Survey Department his opinion was that the Indian Army Officer knew of all the departments for which he was eligible. The real point was that his Commanding Officer did not like him to apply for such appointments.

70177. The number of officers in the Survey Department who would be required in the event of mobilisation would depend not only on the extent of the campaign, but on the character and conditions of the country in which the campaign would be carried out.

70178. (*Mr. Sly.*) He was not in favour of the proposal that recruitment from the Indian Army to the Survey Department should be wholly abolished, and that recruitment should be restricted to Royal Engineers. It was a good thing to have officers of different classes and different training in the department. The Indian Army man had experience of Indians, of the sepoys and the language of the country. Indian Army Officers did not form part of the war reserve.

70179. The salaries of Royal Engineers employed in the Survey Department were on a substantially higher level than the salaries of Royal Engineers employed in the Public Works Department. He could not say why the salaries of the Royal Engineers in the Public Works Department had been reduced. The salary of the Royal Engineer officer in the Survey Department had not been altered. His average pay in 1890 was Rs. 1,262, and it stood at that figure at the present time. The pay of a Royal Engineer in the Survey Department had been fixed so as to attract the best mathematical men and draughtsmen from Chatham.

70180. It was the case formerly that in one year there might be more Deputy Superintendents' charges than in another year, but since the reorganisation in 1909 the number had been definitely fixed at 21.

70181. If any rigid rule was prescribed for fixing the proportion of Assistants to executive officers, Government ought to be liberal in the case of a department which had to send men across the frontier. There should be a percentage of assistants allowed for deputation.

70182. The size of topographical parties employed in India had increased within the last 10 or 15 years.

70183. There had been a raising of the status of the three Drawing office posts in the department in 1913. These three offices were first created in 1909; in 1910 the Provincial Service asked that these three offices should be made into executive charges; and in 1913 the Government acceded to this request.

70184. Admission to the Provincial Service was by competitive test. The rule was also laid down that three-quarters of the vacancies should go to the domiciled community, and one quarter to Indians. There was one examination for all candidates, and if more than three-quarters of the men at the top of the list were Anglo-Indians, one of them had to be knocked out. Supposing there were four vacancies, the first three Anglo-Indians were selected and the first Indian. If the rule were abolished, it would lead to a large increase in the number of Indians recruited. One or two Indians had almost always to be knocked out. The three-quarters rule was not justified on the score of efficiency, but by other reasons. It had to be remembered that the Survey Department had to work from Baluchistan to Siam, and required men who were willing to go anywhere. The Indian had a fixed home, he married early and had strong family ties, and preferred to serve in his own Province, whereas the Anglo-Indian had no home, and was willing to go anywhere.

70185. He was not in favour of the proposal that a substantial number of non-commissioned officers from the Royal Engineers should be employed in lieu of officers of the Provincial Service.

70186. (*Mr. Fisher.*) It might be urged as an objection against the present rule under which three-quarters of the appointments went to Anglo-Indians, that the present discontent in the Provincial branch of the Survey of India Department was due to Anglo-Indians. The discontent took the form of envy of the Imperial Officer, and it was undermining the efficiency of the Provincial Service.

70187. The Survey Examiner had been frequently instructed by the Surveyor-General to make the papers easier in order to give the Anglo-Indians a chance. At present an officer in the Service was merely given such technical education as was sufficient for the work he had to do. The stage at which an officer required a higher standard of education was when he came to be eligible for charge of a party.

70188. The present Provincial Service was quite efficient for its work.

70189. Personally, he did not see how the amount of the charge allowances could be varied according to the importance of the charge.

70190. In former days, when railways and communications were defective, the Civilian got his chance of War Service. That happened in every undeveloped country, but nowadays Government could draw on Military Officers, and if a war broke out it would be absurd to ask Civilians to volunteer for War Service.

70191. (*Mr. Madge.*) He did not agree with the statement that no more original survey work remained to be done in India, and that in future all survey work would be merely revisional.

70192. The employment of local Survey Departments under the different Local Governments was likely to prove very uneconomical.

70193. When serving on the Departmental Committee in 1910, he was advised that if the Provincial Service were given the terms which they

were subsequently given, dissatisfaction would cease. As far as he knew opportunity was given to all sections of the Provincial Service to appear before that Committee.

70194. Under the old system a Provincial officer promoted to the bottom of the Imperial list received about the same pay as that of the Junior Imperial Officer.

70195. He was of opinion that the best training schools for topography were the Military Colleges at Chatham and Sandhurst. He did not think any serious exception could be taken to Colonel Longe's opinion, that neither the military man nor the civilian was useful to the Department until he had undergone the special survey training required for Indian conditions. Colonel Longe did not intend to deny the valuable technical survey training given at Chatham. What Colonel Longe was probably referring to when he spoke of Indian conditions was not the actual topographical work, but the knowledge which officers had to acquire of Indian communities, customs, languages and methods.

70196. He thought in a great national emergency the work of the Survey of India Department ought to be suspended. In a great national emergency the requirements of war came first, and the peace work of the Survey Department must suffer for the time being.

70197. He had always regarded the three Drawing Office appointments as important charges. The appointments carried a charge allowance and the Officers holding them simply draw the allowance in addition to their substantive pay. The Drawing Office appointments were normal executive charges, and rightly so. The Senior Provincial Officer at Mussoorie had been offered charge of a field party, but he had refused it, and begged to be allowed to remain in charge of his Drawing Office.

70198. (*Chairman.*) When the Government of India gave orders that recruitment to the Provincial Service should be stopped, there was no intention of abolishing the Service. The idea was simply to stop recruitment until the number of officers was reduced to 87.

70199. He would put in a statement* regarding the recent reorganisation.

* *Vide* Appendix I.

(The witness withdrew.)

J. O. GREIFF, Esq., Deputy Superintendent, Survey of India Department.

Written Statement relating to the Survey of India Department.

70200. *1.* Before being examined on the evidence already submitted by my Service last April, I crave the indulgence of being permitted to put before the Commission the statement I have now drawn up on behalf of the Service I represent. My reasons for begging this indulgence are—

(*i*) That the officers selected by the head of the Department on March 9th, 1913, to prepare memoranda of evidence were directed to do so individually, and were obliged to submit it by April 15th, 1913. At this time of the year officers of the Survey are scattered all over India on field duties, and it was therefore not possible to convene a meeting and submit corporate evidence.

(*ii*) That the want of a co-opted member has placed us at rather a disadvantage, and that therefore it is necessary to submit a more detailed memoranda of evidence. We were not aware that in our memoranda we should have asked for the privileges of a co-opted representative. We understood that orders for the selection of a co-opted member and representative witnesses to be examined by the Commission would issue later.

(*iii*) That the evidence now submitted for the favourable consideration of the Commission embodies the views of members of my Service as a whole, and I am directed by them to ask, that I be fully examined on all statements concerning my Service.

2. In its infancy the Survey Department consisted of Military Officers and Civil Assistants, both holding gazetted rank, and with the same possibilities of promotion to the higher appointments. Later the Department was reorganised, and divided into "senior" and "junior" divisions, with a recognised proportion of appointments in the former belonging to the latter. In 1895, a further reorganisation took place in order to carry out the general principles of the Public Service Commission of 1886-88. The leading feature of this change was that promotion from the junior to the senior division was stopped, but to compensate the former division (thenceforward to be termed the Provincial Service) for this loss, 10 posts carrying a salary of Rs. 400 to Rs. 1,000 were transferred from the Imperial to the Provincial Service. This was by no means an adequate compensation for the loss the Provincial Service suffered, in being deprived of the promotion to the Imperial Service, both as regards emoluments and status. Under the old rules, junior division officers promoted to the senior division could expect to rise to Rs. 2,000 or at least Rs. 1,600 as the accompanying list of the officers so promoted will show. The highest pay allotted to the Provincial Service was only Rs. 800. Their status was irretrievably lowered, as they were gradually reduced to a position of inferiority and subordination and deprived of executive and independent charges, which they enjoyed equally with the senior division officers prior to 1895.

3. So badly and with such short-sightedness had this scheme been evolved, and so little had its effects on the members of the Service been gauged, that hardly was it launched when memorials poured in against it, the justness of which had to be recognised, and expedients in the form of personal allowances were granted to members who joined prior to 1884.

4. The total strength of the Senior Division on 1st January, 1895, was 50, as follows:—

Administrative Officers		...	...	2
Other	,,	...	...	48
Military	,,	...	...	37
Civilian	,,	...	...	13

The steps taken gradually to reduce the Imperial Service from 50 to 40 were consistently followed until we find that in 1905 the strength of the Imperial Service was reduced to 42 (*vide* List of Survey Officers on 1st January, 1905), eight out of the 10 posts having been transferred to the Provincial Service. There were then only two more posts remaining to be transferred to the Provincial Service to reduce the strength of the Imperial Service to 40 as laid down in 1895.

5. Ever since the constitution of the Imperial and Provincial Services in 1895, the policy of the Department regarding the allotment of the administrative and executive charges unreservedly among the Military and Civilian officers promoted from the junior to the senior division, was changed into one of monopolising all the administrative and executive charges for the Military officers, and reducing the Provincial officers to subordinate positions. No such change was probably intended by the Public Service Commission of 1886-87, when they recommended that the Service should be divided into Imperial and Provincial Services. In 1895, immediately before the creation of the Imperial and Provincial Services, there were no less than seven officers promoted from the junior to the senior division holding executive and responsible charges. As these officers retired the corresponding executive charges were not given to the Provincial Service.

6. In 1904-5 a Survey Committee was appointed by Government, and this Committee, among other things, investigated the organisation of the Imperial and Provincial Services. The Military

officers who appeared before this Committee made unfavourable reports regarding the qualifications of the Provincial officers. The interests of the latter were not represented on the Committee, and they were not given an opportunity of defending themselves. In fact the Provincial officers were not even aware of the statements that were being made to the Committee, and realised the true state of things only on the publication of the Committee's Report. It is evident also from the same report, Vol. I, page 57 (President's dissent) and page 59, that in spite of the *ex parte* hearing, the charges were unsubstantiated, and appeared to be based on inconclusive statements. The Government, however, took the view that the Provincial Service as a body were inefficient, and its members unfit for independent responsible posts. It would be interesting to know how the Provincial Service (late junior division) the members of which were promoted to the Imperial Service (late senior division) up to 1895, and were holding responsible posts till then, could have undergone within ten years so rapid a deterioration. If true, there certainly would appear to be something "rotten in the State of Denmark." To show that the officers of the junior division were recognised as capable and efficient in 1895, I quote from the Government of India Resolution No. 6—46, dated 27th March, 1895: "The Government of India believe that these concessions will remove the legitimate grievances of the Provincial Service of the Survey Department, and in granting them they desire to endorse the opinion of the Surveyor-General as to the excellent work done by these officers in positions of considerable responsibility, and often under circumstances of great difficulty."

7. Notwithstanding the pronounced views held and given utterance to by Sir John Miller, President of the Committee, the Provincial Service was deliberately and coldbloodedly left out of the reorganisation affecting every branch of the Department and of which the Imperial branch derived the most substantial benefit; and this on the top of a written statement made by Col. Longe, Surveyor-General, to Provincial officers, whom he bound down to silence, that no branch of the Service was going to derive any pecuniary benefit. The Provincial Service was ear-marked as inefficient and left to die out by the efflux of time. The strength of the Imperial Service was increased from 40 to 55, and that of the new Provincial Service reduced to 87, Government of India Order No. 544, dated 5th April, 1910.

8. To meet the heavy increased cost of the Imperial branch the Provincial branch was sacrificed. It was not possible, without heavy expenditure, to improve the emoluments of the Indian recruited branch, and at the same time deal so generously with the Imperial branch, and it would appear that the new Provincial Service was introduced merely to give the reorganisation the semblance of equitable treatment. It would have taken over 30 years to complete the cadre of such a Service, during which time the revision survey of India would have been completed.

9. There also can absolutely be no doubt that the underlying principle in increasing the strength of the Imperial Service was that there should be at least two Military officers in each party or office, so that the Provincial officer would never have even a temporary or officiating executive charge, and be reduced to a position of absolute inferiority and subordination. That this was so, I shall quote a statement made by Colonel Longe, Surveyor-General, on 17th February, 1906, at "The Palms," Dehra, to a senior Provincial officer: "It is intended that never in future will it be possible for a Provincial officer to hold charge of a party. Nor ever again to have charge of survey operations on political missions, such as Mr. Tate has carried out. In future there will always be in every party two Imperial officers, so that there will always be an Imperial officer to spare." The statement speaks for itself.

10. The officers of the old Provincial Service in a body protested against the new scheme, and memorialised Government for a redress of their grievances. The result was the appointment of the Departmental Committee of Enquiry in 1910, presided over by Colonel Burrard. The findings of this Committee negatived the misleading statements made during the enquiries of 1904-05, and on the strength of its report the Government of India were pleased to forward another despatch to the Secretary of State practically cancelling the previous one of 1908 as far as the Provincial Service was concerned, and thereby acknowledging the injustice which had been perpetrated.

11. The results of the reorganisation of 1st March, 1912, were the amalgamation of the old and new Provincial Services, and the creation of seven additional executive charges as follows:—Three chief draftsmen of the Circle Officers to be called Executive Officers in charge Drawing Offices (this is a change merely in designation as the officers do not enjoy the privileges or exercise the functions of Executive Officers), one Cantonment Party, one Base Line Party, Simla Drawing Office, and Dehra Dun Drawing Office to be executive charges.

12. The change of designation of officers drawing Rs. 650 and over from Extra Deputy Superintendents to that of Deputy Superintendents, and the 12 senior officers drawing Rs. 600 to be styled Assistant Superintendents. The four senior officers holding executive charge to draw Rs. 200 charge allowance, and the three junior Rs. 100. The creation of a system of artificial relative ranking which has not yet been given effect to.

13. For these concessions the Service is indebted to Colonel Burrard, Surveyor-General, who recognised the justness of the grievances of the Service, and endeavoured to remedy them in the most practical way. The improved conditions, while removing some of the grievances under which the Service has been suffering for years, leave untouched the more pronounced disabilities.

14. The points I am therefore desired to lay before the Commission are these:—

(*i*) That the Imperial or Superior branch of the Service be thrown open to the Provincial branch as was the custom prior to 1895. That part of its strength be recruited at "Home" or from Military Royal Engineer Officers and part in India, from the selected officers, both European and Indian, of the Provincial branch.

ii. That there is no necessity for the large highly paid controlling staff at present in the Service, when a large portion of their duties could be discharged by officers on smaller salaries. The strength and cost of the existing Imperial Staff is out of all proportion to the needs of the Department, and its total expenditure. Even Military considerations do not necessitate the continuous service in the Department of a large number of highly paid Military officers.

iii. That suggestions put forward for the abolition of the Provincial Service are the outcome of a desire to reserve as a Military monopoly a highly paid Civil Department of the Government of India, and to secure its higher branch against recruitment from Indian sources, which would naturally lead to a reduction in its Military strength and in emoluments. Any change of this kind would be an injustice to the European and Indian communities of India, and would be a further source of discontent in the country, and require to be minutely and carefully examined by a representative Committee. Even if it be possible to adopt so unjust and drastic a change, then in place of the Provincial branch, the Imperial or superior branch be opened to recruitment in this country to the extent of two-thirds of its appointments in equal proportion between Europeans and Indians.

(*iv*) That all officers of the existing Provincial branch be classed as first class officers for purposes of travelling allowances.

(*v*) Conditions of leave.

(*vi*) That the designation "Provincial" and the prefix "Extra" are misnomers and be excised.

15. Dealing with them seriatim :—

The reasons for claiming admission to the superior branch are based on the grounds that it existed before, that it worked more harmoniously and produced good fellowship, that no such artificial bar to merit exists in the other sister Services, and that it leaves no occasion for invidious distinctions in status, official precedence and treatment.

The existing system is not liked in the Survey, and was objected to by the Surveyor-General Sir Henry Thuillier in his evidence before the last Commission. He advocated the promotion of "Junior" officers to the "Senior" branch. Colonel Burrard, the present Surveyor-General, President of the Departmental Committee of Enquiry of 1910, reported to Government in that report, as follows :—"As the question of promotion to the Imperial Service concerns many departments the Committee cannot presume to make recommendations, but they wish to point out, that in the old days of promotion to the Imperial Service both the Imperial and Provincial Officers liked the system. It necessitated stricter selection, and it promoted good feeling between the services. In the evidence before the Public Service Commission, the Surveyor-General and other senior officers of the Department, who had long experience of the system expressed a wish for its continuance. Certain advantages would ensue if the higher posts of the Provincial Service were retransferred to the Imperial, and filled by officers of the Provincial Service." With the spread of education and efficient technical training available in India, there is no just reason why this branch of the Service should be closed to the Indian branch. In the Public Works Department and the Telegraph, no such artificial bar exists. The officers are all on one cadre and the highest appointments are open to them.

"It must be obvious to unprejudiced minds that such a division does and must introduce the virtual relationship of "subordinate" to the "officer" and in no Department could it have been so emphatically introduced as in the Survey. It is one of the fundamental principles of the Liberal Government of the day, and one of the soundest guarantees of efficiency, zeal, emulation and progress in any service, that there should be no artificial bar to merit. This is in effect what has been done and is being done to the Provincial Officer to-day. To remove this bar would be to remove in the words of the Prime Minister, in his memorable speech at Birmingham, "the domination of an unjust monopoly, and to open everywhere the gate to intelligence to merit, and to energy."

It is owing to this system that it has been possible for prejudiced administrative heads to place Extra Deputy Superintendents of the Provincial branch of over 20 years' service in positions subordinate to the most junior inexperienced Imperial officer, to treat them without consideration for their rank and experience, and to regard them officially and socially as inferiors.

The introduction of any artificial system of relative ranking between officers of the two services holding similar posts will not adjust the anomalies of the existing system. Till quite recently the Provincial officer held no official relative rank alongside the Imperial officer. By Government of India Order No. 611, dated 15th February, 1913, some sort of artificial compromise has been arrived at, which is not regarded with much favour by Provincial Officers. The order has not been given effect to in the Department. The ridiculousness of the artificial rank conferred by it, has further been enhanced by the issue of Government of India Order No. 617, dated 30th June, 1913. The one contravenes the other, and adds only further indignities. To illustrate the indignities of a position created by orders of the above nature, I will narrate the case of Mr. G. P. Tate of our service.

In 1902 he was Chief Survey Officer with the Seistan Boundary Commission, and by the existence of orders of the above nature, he ranked as a second lieutenant of two years' standing—Mr. Tate was about 45 years old—although holding one of the most important posts in the Commission. The consequence was, that he was subjected to no end of indignities at the hands of the Military officers. He represented matters to Sir Henry MacMahon, who recommended to the Foreign Department, that he should rank as an attache. The matter was put up to Colonel Longe, the Surveyor-General, an officer unfavourably disposed to the Indian branch of the Department, and he opposed the recommendation. The consequence was, that Mr. Tate had to endure his subordinate position, which was made more galling, when it is known that his Public Works Department confrére ranked as a Colonel. The Public Works Department man was given a C.I.E. Mr. Tate got nothing but a small personal allowance, and retired without being given even an executive charge. He is an officer with a splendid record of frontier and transfrontier service, surpassed by few Imperial Officers of to-day, and is an author and authority on transfrontier and border history. To show that Mr. Tate was an officer not unworthy of distinction, I will quote only one of the reports on him by an officer outside the influence of survey prejudice. Major (now Sir) Henry MacMahon reporting on Mr. Tate, says :—"The moderate nature of Mr. Tate's report does not adequately describe the difficulties under which much of his work was done. It was always willingly and cheerfully done, and, as always found in the case of members of the Survey Department, carried out with an enthusiastic devotion to work. Mr. Tate gave me much valuable assistance in every way, and I cannot speak too highly of his work." Recognition of good work done by European and Anglo-Indian Provincial Officers has heretofore deserved no titles or distinctions. The work done is even slurred over in annual reports and the credit given entirely to Imperial officers. The Department must acknowledge with gratitude the great honour recently conferred on Mr. G. B. Scott, but this is the first honour so conferred, and it has come to Mr. Scott many years after his retirement. The existing division also lends itself to misrepresentations as regards the duties, efficiency, and ability of the Indian branch, and also to the want of official courtesy, sympathy and support on the part of Imperial officers. In this connection I would recommend for the consideration of the Committee the evidence taken by the Committee of 1910.

The exclusion from this branch on grounds of inefficiency is untenable. It is the argument which has been constantly and persistently advanced since the inauguration of the policy of 1895. It is the outcome of constituting one branch of the Department as an exclusive reserve for Imperial Officers, and it has been fostered by the policy of excluding wholesale, men born and bred in India from higher appointments, on inaccurately alleged grounds of defects in education and character. But the records of the Department in the past, and the actual work done by provincials now, are ample and complete refutation of these misleading statements, I attach a list showing the officers of the old "junior" branch who creditably discharged the duties of their position. The records of the Department attest to the efficiency, zeal and devotion with which their duties were carried out under far more difficult conditions than now exist.

To state that the Provincial Officer is only employed on subordinate duties is equally incorrect. The statements I have attached giving the composition of a "field division" in Southampton, and of one in India, fully explain the duties of the Provincial Officer, and show that there are no higher or more responsible technical and professional duties that can be undertaken by Imperial officers attached to parties.

Give a Provincial Officer an opening in his line of work in other departments, and under foreign Governments, and he invariably returns with a splendid record of service generously recognised and admitted. This has been the case in the past, and is so now. Mr. Newland, in 1899, at the early age of 23, undertook for the Hongkong Government, all classes of survey work, and returned with the highest approval of his work by that Government. Mr. Glass, after five or six years' service in

this Department, left and joined the Public Works Department. He has just been selected for work in Siam, on a salary of Rs. 1,200 a month, and is regarded as an expert in Public Works Department surveys for irrigation plans. Mr. Veale, of our Department, is Professor of Survey and Drawing at Roorkee, he replaced a Royal Engineer, and has proved himself a decided success. Can any one contend that there are not men of equal ability at the present moment in our service? There is no branch of the professional work of the Department in which the Provincial Officer has not his share, and as a personal workman, he outclasses his Imperial colleague. There is absolutely no difference, and there can be no difference in the duties discharged in topographical parties between Imperial and Provincial Officers. To quote from Colonel Burrard's report of 1910:—"The Committee are of opinion that as a body the Provincial officers are efficient, hard-working, and quite capable of performing their duties; and that after the necessary training and experience several of them would prove efficient executive officers. Although the education obtainable in schools in England is superior to that at present available in India, the Committee do not consider the initial advantage conferred upon Imperial Officers to be so paramount as to justify the extreme view that every Imperial Officer is qualified to hold charge of a party and that no Provincial Officer is qualified."

* It has now become necessary to announce that the same rules have also required the retirement of a highly distinguished officer, Mr. J. B. N. Hennessey, M.A., F.R.S., selected early for his special talents, which he has since developed by study and perseverance during his service in India, and who has made a name for himself not confined to India, but known to the world of science in Europe and America, and he has, after passing through all the grades of the Department, attained the highest place but one, in which he has employed his unique experience and knowledge of scientific matters. The Department, and especially the Civil branch, may justly be proud of him.

† The Department has been deprived of the services of a very well known and respected officer, Mr. J. O. N. James, for many years the very energetic, efficient, and experienced Assistant Surveyor-General in charge of the headquarters Engraving and Drawing Offices. He has retired carrying with him the good wishes of all his brother officers of every grade.

‡ Died in Service.

16. (ii) A controlling staff of 55 highly-paid Imperial Officers is out of all proportion to the requirements of the Department, and is an unnecessary drain on the resources of the country and the Department. I doubt whether in any other service the incidence of control is so high. This unnecessary increase of officers was clearly foreseen by Sir John Farquharson, member of the Committee of 1904-05 (vol. ii, pages 42, 43). In discussing recruitment for the Imperial Branch, he said: "It would seem inevitable that, unless there is an abnormal number of casualties or retirements, there must be a larger proportion of senior men employed under a system of continuous service than are actually required." It was for this reason he advocated that Military Officers should be appointed for tours of five to seven years' service with the Department, and then be reverted. Continuing he said:—"The system of continuous service would appear of necessity to mean an excessive number of officers being employed in the senior ranks, whereas by being relieved at the end of a five years' tour the Surveyor-General would be enabled to select later on only that very limited number which would be all that he would require for carrying on the very superior and higher administrative duties of the survey." Sir John Farquharson was a Royal Engineer, for some time Director-General of Surveys in the United Kingdom an officer who throughout the enquiries of the Committee of 1904-05, exhibited an intelligence and grasp of the actual requirements of the Indian Survey Department equal to if not superior to that shown by our own officers. His proposals were also supported by Colonel Kelly, Assistant Adjutant-General, nominated by the Commander-in-Chief to watch the interests of Military requirements. The scale of pay suggested by Colonel Kelly was as follows:—

Lieutenants of 7 years' service, Rs. 515-12-0, against Rs. 570 to 720 now drawn.

Lieutenants over 7 years' service, Rs. 615-12-0, against Rs. 720 to 1,070 now drawn.

Captains under 15 years' service, Rs. 833-10-10, against Rs. 1,120 to 1,220 now drawn.

Captains over 15 years' service, Rs. 833-10-10 against Rs. 1,220 to 1,400 now drawn. In this connection I would also invite the attention of the Commission to the recommendations of the Committee of 1904-05 in Vol. I, pages 57, 58, para. 100.

Why these proposals were not adopted by the Government of India, I am unable to say. The advantages of the proposals made by Sir John Farquharson in facilitating expansion and contraction of this branch of the Service are obvious. I am not sufficiently expert to give an opinion on the feasibility of the recommendations, but anyone possessing a knowledge of the facilities that exist in the machinery of the Government of India for transferring officers without injury to the work of the department to which they belong, or detriment to their prospects, for periods of five years' duty and more with foreign Departments, could work out a scheme, and Government cannot fail to realise the practicability of it. There can be no doubt that the Committee as a body of experts were aware also of its workability. Knowing the sentiments that actuated the Surveyor-General of the time, it is impossible to advance any other reasons for the adoption of the existing system other than class interests, and the fixed intent to eliminate for ever, the members of the Indian recruited branch, from executive charges. Prior to 1904-05 there were only three administrative posts, viz., Surveyor-General, Deputy Surveyor-General and Superintendent, Trigonometrical Surveys. There was also a Superintendent of Forest Surveys, but this officer held executive charge of a field party, in addition to his duties as a Superintendent. There are now six administrative posts, viz., Surveyor-General, Superintendent, Trigonometrical Survey, three Superintendents, Topographical Surveys, and one Superintedent, Map Publication Offices. The jump from three to six in administration is abnormal. The emoluments attached to the posts of Superintendents are also high. The pay of the Surveyor-General is Rs. 3,000 and is the same as before. The salaries of the other administrative officers are as follows:—

2 Superintendents' pay Rs. 1,500 + charge allowance Rs. 750 = Rs. 2,250.

3 Superintendents' pay Rs. 1,500 + charge allowance Rs. 500 = Rs. 2,000.

In addition to the above, the Superintendent, Trigonometrical Surveys, draws an additional allowance of Rs. 100, *vide* Government of India Order No. 545, dated 5th April, 1910. Formerly the Deputy Surveyor-General's pay was Rs. 2,200, and the Superintendent, Trigonometrical Surveys, used to get an allowance of Rs. 200 in addition to the pay of his grade. If he was a Superintendent, 1st grade (old organisation), his pay as Superintendent, Trigonometrical Surveys, could not exceed Rs. 1,600 + Rs. 200 = Rs. 1,800. The difference between these salaries and those drawn now is obvious. The duties of the Superintendent, Trigonometrical Surveys, cannot be said to be more onerous now than they were before. Those of the other four Superintendents are considerably less than those of the old Deputy Surveyor-General, who used to supervise nearly half the number of the Topographical parties in the Department.

There are also 21 executive charges, each with a charge allowance of Rs. 200. The introduction of the system of charge allowances is quite a novel innovation, and peculiar to this Department only. The *raison d'etre* of an officer is to hold charge, and to give him a special allowance for doing so, seems to say the least of it, anomalous.

Under Resolution No. 63—82E., dated Calcutta, 18th January, 1911, it has been ruled that all future Royal Engineer entrants into the Public Works Department after 11th December, 1910, " shall draw pay under the Civil scale in accordance with the rules laid down in the Public Works Department Resolution No. 675-694E., dated 24th April, 1908." The old practice of paying the Royal Engineer officer Military Staff pay in addition to Departmental pay has been abolished, and he gets the same pay as the Civilian Officer that is in the Public Works Department. The Royal Engineer Officer no longer enjoys any superior advantages in the matter of pay, and as an Executive Engineer of 20 years' service he cannot draw more than Rs. 1,250 a month, as against Rs. 1,500 plus charge allowances in the Survey of India. There appears to be no valid reason why the Royal Engineer officer joining the Survey of India should have better prospects than on joining the Public Works Department. Again, the Royal Engineer officer entering the Survey of India, say, in his fifth year, starts with an initial salary of Rs. 370, plus increments of Rs. 50, counting from date of first commission, that is, he would receive Rs. 620. In the Public Works Department first year of service is reckoned to commence $2\frac{1}{2}$ years from date of first commission with increments of Rs. 40, so that an officer with five years' commissioned service to his credit would start with increments of Rs. 40 on a salary of about Rs. 500; in his 11th year as Executive Engineer he draws Rs. 800, in his 15th year Rs. 1,000, and in his 20th year Rs. 1,250. The comparison speaks for itself.

I append two statements showing the strength of this branch of the Service since 1887, and the cost prior to 1904-05, and the cost in 1912. Two points stand out prominently in these tables—one the increase in strength, the other in cost. It will be observed also, that while the total number of administrative and executive posts were as high as 27 and 29, the Military strength did not exceed 37 officers, and no one can contend that in the present day there is a greater demand for officers for military expeditions, etc., in fact, there may be said to be hardly any, compared with past years, and judging by events and the reconnaissance on the north-east frontier there will be less in the future. In the Headquarters Drawing Offices in Calcutta prior to 1905, one officer, styled an Assistant Surveyor-General on Rs. 1,482-100 a month, carried out practically the same duties discharged by two officers now, amounting to Rs. 3,470 a month.

I attach also a list showing the distribution of officers on 1st July, 1913. There are so many in the Department now that it is difficult to find means of employing them, and expedients of attaching two and three to a party have to be resorted to. Last year there were three Imperial Officers in this party at a cost of Rs. 2,500 a month. At present we have an Imperial Officer on Rs. 970 a month instructing half a dozen Upper Subordinates. I believe he is to get a charge allowance as well. There is a training school at Bangalore sanctioned by Government with an allowance of Rs. 100 towards the Instructor's salary. The officer in charge is a most efficient officer on Rs. 500 a month with years of experience, so that we are now spending Rs. 1,500 a month on instruction, to say nothing of extras. When the training school was in Dehra a Provincial Officer on Rs. 400—500 a month was in charge of the school, and in this school all officers, Imperial and Provincial, and lower subordinates, went through their training. On the recommendations of the Committee of 1904-05, three training schools were started, one at each Circle headquarters, and were in charge of Provincial Officers, each drawing a charge allowance of Rs. 100. The Government of India in their orders on the reorganisation of the Provincial Service in 1913, directed that two of these schools should be closed as further recruitment for the Provincial Service had stopped, and one of them retained, in which all Upper Subordinates and Lower Subordinates should be trained, so that there is no necessity for the present innovation and expenditure, and if the necessity had arisen the billet should have gone to the Provincial Service. The present arrangement shows that the Imperial Service is in excess.

Statement showing strength of Department from 1887-1913.

The argument that such a large and well-paid controlling staff is necessary, owing to the inability of the Provincial officer to discharge higher and more responsible duties, is untenable. A list of officers of the Indian branch, who discharged executive duties under far more trying circumstances than attend present-day surveys has been submitted. The Committee of 1904-05, in spite of its being a one-sided one, clearly stated in its report, Vol. I., pages 57, 59, that sufficient opportunities had not been given for holding such posts to the Provincial Service officers, and that their inefficiency had not been proved. The Departmental Committee of 1910 has also upheld the view that selected officers would be quite fit for such duties. Only four officers have been in independent executive charge since 1st March, 1913; one of them for some time prior to this date. There is no reason to say their work is inefficient. The statement before the Commission, that from reports their work was not as good as Imperial Officers is incorrect, and I must question the accuracy and veracity of the reports made. I am one of the executive officers myself. The work done by my party is in no way inferior to that done by the others. When the work of this party was examined on the 26th August, 1913, by the Surveyor-General, Colonel Renny-Tailyour, he expressed himself greatly pleased, and congratulated me on the quality of the work of the party. This opinion was endorsed by Major Robertson, Officiating Superintendent. It has been the rule for Surveyors-General at their annual inspection of parties to submit officially a report on the result of their inspections. Why this was not done this year I cannot say. The other officers, Mr. Ewing, Mr. Shaw and Khan Bahadur Aulad Husain are thoroughly efficient. It is not difficult to see that the eligibility of Provincial officers to executive charges does not find favour with the bulk of Imperial officers. And it is perhaps not wrong to state, that if Colonel Burrard were not returning to duty, efforts would be made to subvert his policy, and to pronounce the Provincial officer a failure as an executive officer. The Provincial officer cannot by any means flatter himself that his position is made easy for him. On the contrary it is just the other way, and his is no easy task, placed as he is, in a branch of the Service which has come to be regarded as inferior, and the interests and aspirations of which conflict with the superior, and make him feel that his executive position is merely being tolerated by officers who would wish it otherwise. During the months I have been in charge of this party, I have lived in a state of constant concern and anxiety, knowing the feelings that exist against my Service. Is not such a position most difficult? And is this not a severe handicap?

I am therefore desired to put up for the consideration of the Commission the following proposals for the composition of the Department. Accepting the existing number of administrative and executive posts to be necessary for the efficiency of the Service, viz., six Administrative and 28 Executive, it is proposed:—

(i) That five Administrative posts and 18 Executive be allotted to Imperial officers, and one Administrative post, and ten Executive to the Indian recruited branch.

(ii) That the salaries for the Imperial branch be recast on the following lines:—

	Rs.
Surveyor-General	3,000
Superintendent, Trigonometrical Surveys ...	2,000
Senior Superintendent	1,800
Two Junior Superintendents	1,750

One Superintendent, Provincial Service, Rs. 1,500.

Twenty-eight Executive posts to be divided between Imperial officers and qualified selected officers transferred from the Provincial Service. The pay of the former to be limited to Rs. 1,500, the pay of the latter to Rs. 1,250. The two classes of officers to be on the same cadre, and to rise by annual increments of Rs. 50. All charge allowances to be abolished. The first term of Service with the Department of all Military officers to be limited to a tour of from five to seven years. During this tour his salary to be regulated according to the scale proposed by Colonel Kelly and already given on page 292, and on his being permanently appointed to the Department to receive the scale of pay in force. His pay for purposes of increment being calculated from the date of his first term of service with the Department. The Junior Service to rise by annual increments of Rs. 20 for the first 10 years and Rs. 25 thereafter to Rs. 700. Officers of this Division to be eligible for transfer to the Senior Division after 15 years' service, that is, when in receipt of pay between Rs. 550 and Rs. 700. Officers so promoted to carry forward all but eight

years' service, to count for position in the Senior Division. Confirmed Deputy Superintendents of the present Provincial Service to rank next to the 21st Deputy Superintendent in the Imperial Service.

When a party officer of the Senior Division, if he is one who has been promoted from the Junior Division, goes on leave, an officer of the Junior Division should officiate for him. The officer so officiating to draw an officiating allowance of Rs. 100 a month, in addition to the emoluments he may be in receipt of when taking up the officiating appointment.

The existing non-executive responsible posts in the Provincial Service to be retained for the benefit of the Junior Division. That is, the Chief Draftsman, headquarters, with an allowance of Rs. 150; the Head Draftsman, with an allowance of Rs. 120; the Chief Draftsman, Forest Map Office, Bengal Drawing Office, and Instructor, Training School, each to receive an allowance of Rs. 100, all these allowances to count towards leave and pension. The designation of Chief Draftsman, Headquarters Office, to be changed to Personal Assistant to the Superintendent, Map Publication Office, and the Head Draftsman to be called the Chief Draftsman.

All officers of the Senior Division from whatever source recruited to be under European rules for leave and pension.

I and all the other officers of the Service strongly advocate the institution of a Pension Fund for the widows and children of Indian recruited services, similar to that for Civilians and Army Officers.

The institution of such a Fund would be an immense boon to the officers of this country. The idea might be recommended to the Finance Department and details worked out by them. Any officer willing to pay into the Fund by monthly instalments, the sum, or certain proportion of the sum, he would have paid from first year of service or from date of marriage, should be considered eligible to the benefits of the Fund. It should be confined to the superior Indian recruited services. Such a Fund would be a great advance on the Provident Fund lately started. Accumulations in the Provident Fund can be drawn on certain conditions, and is really not a certain and sure provision against the accident of death.

That the cadre of the Junior Division be increased, and the Upper Subordinate Service be abolished. There is absolutely no necessity for this branch of the department, and it is an unnecessary expense. The arguments originally advanced in support of the introduction of this branch were to reduce the amount of supervision required by increasing the efficiency of the men employed on actual work, and so lead to economy. It was argued that the employment of a higher class of Surveyor would enable a considerable reduction to be made in the number of subordinates and attendants employed, and that the upper subordinate would be employed on tertiary triangulation, minor levelling, and the more difficult classes of topographical work. The present policy of the Department would appear to be in direct contradiction to the above statements. As far as my experience of this class of officer goes, he will be neither one thing nor the other.

What is essentially required in the Department is a better class of Surveyor, intelligent, with some education, especially in drawing, and a working knowledge of English. This is badly and sadly needed in the department instead of expensive and unnecessary innovations. The pay of this branch should be from Rs. 30 to Rs. 250 by increments of Rs. 5 and 10. At present we engage men on Rs. 10 who do not even know how to hold a pen. They take years of training, get to a certain degree of skill, then drop off and show no further improvement. It is after all a short-sighted policy, for the better class of man would be equal to two or three of the kind entertained at present. The Art schools of India can provide ample good material, but of course they will not come for the salaries offered, and the department, on account of its expensive controlling staff, cannot afford to be lavish.

For a service constituted on the above lines the number of Military officers required would be—

Administrative posts	5
Executive charges	18
Under training from Military Works Service	5
Leave reserve (under training)	6
Total ...	34

All the above to be Royal Engineers, those doing their first tour with the Department to be junior captains and senior and junior lieutenants.

At the same time there does not appear to be a necessity for so many administrative posts in a small department like the Survey. The number and the emoluments attached to these appear to be excessive.

In the Public Works Department the Superintending Engineer class has three grades of Rs. 1,500, Rs. 1,750 and Rs. 2,000, and the Superintendents in the Survey of India are graded from Rs. 2,000 to Rs. 2,350, and it has, moreover, to be remembered that most of the survey work now in hand is revision survey, and there is little new survey to be done. Survey work, if anything, is comparatively easier now than in years past, when ground was being broken for the first time, the means of communication few, and arrangements on a large scale necessary.

The number of administrative posts that would appear to be essential to the Department without impairing efficiency is four—one Surveyor-General, one Superintendent, Trigonometrical Survey, one Superintendent, Topographical, one Superintendent, Map Publication.

Sir John Farquharson, in his evidence before the Committee of 1904-5, strongly and ably opposed the formation of any such division of India into circles for Survey work, Vol. I. page 129, Vol. II., page 46, paragraphs 32, 33, 34.

The number of Executive charges could also be reduced. The work of the Base Line party which has just been created could be well conducted by the Executive officer of the Triangulation party. It has always been part of his work. This officer does no triangulation personally now, all the triangulation being done by Provincial officers. The Pendulum and Astronomical parties consist of an Imperial officer and an Assistant each. Each officer draws Rs. 200 charge allowance. These parties could be combined. With such changes, and constituted on the lines proposed, the cost of the Department could be considerably reduced.

Whatever be the final recommendations of the Commission, I am desired to ask, that in fairness to officers recruited in India, a fair proportion of the appointments in the Imperial branch be allotted to them as was the case prior to 1895. That with a view to the introduction of such a policy, further recruitment from Military sources be stopped, and the existing Executive appointments in the Provincial branch be transferred to the Imperial cadre. All Deputy Superintendents, Provincial, ranking above Assistant Superintendents, Imperial.

Another reason advanced for so large a Military staff is the necessity for having a Military reserve for Military expeditions. The argument does not bear analysis. The system of recruitment proposed by Sir John Farquharson would have secured, in an ample measure, the required reserve, and the country saved the expense of maintaining in continuous service 28 Assistant Superintendents on exorbitant salaries. Are not Provincial Officers also available for Military expeditions? Have they not been on Military expeditions before in Afghanistan, Tirah, Waziristan, Baluchistan, Burma, Lushai, and distinguished themselves. I need only quote such names as Johnson, Scott, McNair, Claudius, Wainright, Stotesbury, Tate, Kennedy, among others. It is an injustice that this door to distinction should be closed to the Indian recruited branch as has now been done.

I attach a list of officers of the Junior branch, who, prior to 1905, were on Military duty and on Political Missions.

Statement showing brief history of war and trans-frontier services rendered by the members of the Provincial Service (old Junior Division) of the Survey of India.

War and Trans-frontier Services.

1. W. H. Patterson—
Mutiny, 1857-58, served against Murree Rebels—Medal.

2. E. C. Ryall—
Mutiny, 1857-58, served against Murree Rebels—Medal.

3. E. C. Barrett—
Lushai Expeditionary Force, 1871-72—Medal and Clasp and thanks of Government.

4. G. H. Cooke—
Lushai Expeditionary Force, 1871-72—Medal and Clasp and thanks of Government.

5. W. H. Reynolds—
1863, Umbeyla Expedition—Medal and two Clasps.

6. G. B. Scott—
1867-68, Black Mountain Expedition, Medal and Clasp and presented with a sword for gallantry.
1869, Reconnoitered independent tracts of Chilas and Kohistan.
1870, Reconnoitered country round Peshawar fired by Hassan Khel.
1871, Reconnoitered Bhutan Hills.
1877, Jowaki-Afridi Expedition—Thanks of Commander-in-Chief.
1878-79, Khyber column, Afghanistan—Medal and Clasp. Granted personal allowance of Rs. 100 and special grant of Rs. 1,000. Recommended for direct Captaincy by Government which was disallowed by War Office.
1879-80, Second Afghan campaign and thanks of Government.
1884, Zhob Valley Expedition—Thanks of Government.

7. M. J. Ogle—
1871-72, Lushai Expeditionary Force—Medal and Clasp and thanks of Government.
1874-75, Dafla Field Force.
1879-80, Second Afghan Campaign—Medal.
1883-84, Akha Hills Field Force.
1886-87, Kubbo Valley and Upper Burma Field Force—Clasp.
1888-89, Mogoung Field Force.
1889, Presented by Royal Geographical Society with the Gill Memoriai.

8. W. MacNair—
1879-80, Afghan War.
1883, Explorations in Kafiristan in disguise—Awarded Murchison grant by R. G. Society.

9. Yusuf Sharif, K.B.—
1881-82, Jowaki-Afridi country survey—Thanks of Government.
1883, Takht-i-Suleman Expedition and Gomal and Khajuri Kach Pass—Special thanks.
1884, Zhob Valley Expedition—Mentioned in despatches.
1884-85, Gomal to Ekbai. Special Survey through Isot Khosa, Mizir Bozdar and Musakhel tribes.
1887-88, Russo-Afghan Boundary Commission. Title of K. B. and Khilat of Rs. 3,000. Explored and mapped Bakhtiari country in Persia. Thanks of Government Triangulated and mapped 68,000 square miles in Persia, awarded Murchison grant of R. G. Society. For special work in military interests received a reward of Rs. 500 by Lord Roberts, Commander-in-Chief.

10. Ahmad Ali Khan, K.B.—
1878-79, Afghan War to 1879-80.
1884-85, Kishanganga Valley and Gilgit Survey.
1885-86, Exploration from Nushki to Afghanistan.
1888-89, Exploration, Kharan to Ladis, Persian Baluchistan.
1889-90, Gilgit Mission Frontier Survey.
1890-91, Exploration, Panjgir to Sistan in Persia.
Exploration, Persian Sistan to Kharan.
1892-93, Exploration from Gwadar to Bampur (Persian Baluchistan) and North of Persian Gulf.
1895-96, Perso-Baluch Boundary Commission, —Title of K. B. and special reward of Rs. 500 from Commander-in-Chief.
1897, Tirah Expeditionary Force.

11. Iman Sharif, K.B.—
1880, Afghan Campaign, Siege of Kandahar —Medal.
1884-86, Russo-Afghan Boundary Commission—Title of K.B. and reward of Rs. 500.
1888, Hazara Field Force—Mentioned in despatches.
1890-91, Explored Bakhtiari country and Kurmi river in Persia—Thanks and reward of Rs. 500.
1892, Anglo-German Boundary Commission in Africa—Reward of Rs. 950 from Secretary of State. Barometer from R. G. Society and Gold Medal.
Kankabai-Durri from Sultan of Zanzibar.
1893-94, Exploration in Arabia in interest of R. G. Society.
1897, Deputed for Survey of Zanzibar.
1898, Employed on demarcation of boundary in East Africa.

12. Hira Singh, K.B.—
1879, Afghan Campaign.
1881, Waziri Survey Expedition.
1883, Takht-i-Suliman Survey Expedition.
1889-90, Survey operations during Zhob and Gomal Expeditions.
1892, Khajuri Kach Field Force.
1895, Waziri Field Force.
1895, Chitral Relief Field Force.
1897, Tirah Expeditionary Force.

13. G. P. Tate—
1893-94, In charge Aden Survey detachment; favourably noticed by Government.
1895, Baluch.-Afghan Boundary Commission.
1899, In charge, Hong-Kong Survey.
1902, In charge, Siestan Mission Survey detachment; twice rewarded with honoraria of Rs. 500 and Rs. 1,000 respectively, for special literary works on transfrontier.

14. J. M. Kennedy—
1886-87, Expedition to Ruby mines.
1887-88, Yaw Expedition.
1889-90, First Chin Expedition.
1890-91, In charge, Survey, Kaington-Cheinganai Mission.
1891-92, Hukong Valley Expedition.
1892-93, Assisted in suppressing rising in N. Shan States—Received Burma Medal and Gold watch and chain.

15. T. E. M. Claudius—
1879, Siege of Sherpur—Medal and Clasp.
Survey from Gandomak to Chardeh Valley.
1880, Mapped the whole of Afridi-Tirah in disguise.
1887, Triangulated 1st class series from N. of Kalat to Gandpahar.
1891, Triangulated through Mekran on to the Persian border.

16. R. Waller-Senior—
1879, Southern Afghan Field Force.
1893, Awarded Murchison grant by R. G. Society for Explorations and Surveys in Glacier regions of Kulu and Lahaul.

17. C. George—
1889-92, Upper Burma and Clasp.
1891, Defence of Kawlin (Upper Burma) and was awarded medal for "Distinguished conduct in the Field."
1895, Chitral Relief Force—Medal and Clasp.

18. Ikbal-un-din, K.S.—
1897-99, Served as Survey officer with Burma-China Boundary Commission.
1900, Served as Survey officer with China Expedition Force—Title of K.S.

19. Abdur Rahim, K.B.—
1889-90, Anglo-Siamese Boundary Commission.
1890-91, Kengtung-Chungonai Mission.
1892-93, Siam Boundary Delimitation.
1894-95, Anglo-French Mekong Boundary Commission.
1900-01, China Expeditionary Force—Medal and title of K. B.

20. W. Stotesbury—
1889-90, Chin-Lushai Expedition—Medal and Clasp.

21. E. A. Wainright—
Triangulated 40,000 square miles in S.E. Persia.
1897, Survey officer with Tirah Expeditionary Force—Medal and Clasp.

22. Asmatulla Khan, K.S.—
1895-96, Pilla Boundary Commission.
1897-98, Malakand Field Force—Medal and Clasp.

23. P. J. Doran—
1892, Anglo-Siamese Boundary Commission.

24. W. M. Kelly—
1892, Anglo-Siamese Boundary Commission.

25. H. G. Shaw—
1892, Anglo-Siamese Boundary Commission.

---

17. (iii) The proposal that a cheaper and more efficient agency for the duties of the Provincial officer could be had in the non-commissioned officer, has its origin in the fact of the latter being employed at Southampton, and chiefly in the reasons already given under this head in the beginning of my memoranda. I submit two statements giving the duties of the Superintendents and Examiners in Southampton, who are usually non-commissioned officers, and those discharged by Provincial officers in Topographical and Trigonometrical parties and Drawing offices of the Survey of India.

Ordnance Survey.

Composition of a "Field Division" taken from Vol. II., pages 44-45, Committee's Report, 1904-05.

One Royal Engineer who is Division or Executive officer.

One Division Sergeant, in charge of accounts, correspondence and office generally.

Four Superintendents with 28 chain Surveyors.

Four Superintendents with 15 Field Examiners.

One Superintendent with 18 Plotters or Tracers.

One Superintendent with 15 Draftsmen.

Thirty-two chainmen.

The surveys done by such a Division are Cadastral (such as are carried out by Revenue parties and now by Local Governments under the executive control of Provincial Officers as Division Officers and entirely Indian agency).

The Division officer receives from the Trigonometrical branch the length of the sides of the triangles as computed, together with a chart showing the positions of the trigonometrical stations. These are sent out to the Superintendents in charge of seven chainmen each. On the stations being identified the posts are restored, and the chain surveyors rechain the sides of the triangles and have to continue to do so until the measurements come within two links in 1,000 of the calculated distance. (It is evident that these triangles must be extremely small and correspond to the size of triangles and squares laid out by Patwaries in this country for settlement surveys.) They similarly measure all interior lines within the triangle which must be made to fit into the triangle according to calculated dimensions. The chain surveyors then take offsets (measurements) entering them in their field-books, to all fences, streams, roads, houses, etc., that fall within the triangle. The field-books are then sent into the party office where the details are plotted on to a plan. When the plan, two feet by three feet, has been filled up by the various triangles, it is divided into six sections, and all detail in each traced in colours. These traces are then sent out to the superintendents in charge of four field examiners each. They check all the details, classify the roads, and collect local information. The completed traces are then sent into the office where the draftsmen pen in ink all details shown on to the plotted plans. The stampers and typers stamp all trees, etc., and type in the names. The Executive or Division Officer then takes the finished plan to the ground and checks it thoroughly. The plan is then signed and sent on to the levelling officer, who, after inserting the levels, sends the plan on to Southampton for reproduction.

Composition of No. 3 Topographical party, Survey of India, employed on Revision Survey.

One Executive Officer—Provincial in this case.

Two Clerks (Indians—one correspondence, the other accounts).

Seven Provincial Officers—one under training.

Two Upper Subordinates under training.

50 Plane-table Surveyors, including nine soldier Surveyors under training, three quite new to the work, and ten 3rd class pupil Surveyors under training.

Two Draftsmen and plotters.

Eight Traversers or Chain and Theodolite Surveyors.

Two Computers.

450 Labourers.

The programme of work for this party to be surveyed in six months, embraces 768 square miles in the Simla district, difficult hilly country, full of detail varying in elevation from 2,000 feet to 9,000 feet; 1,536 square miles in the Dehra Dún district, most difficult and intricate ground, consisting of the Siwaliks covered with heavy forest, the Dún valley, and the hill Sanitarium of Mussoorie. Elevation 2,000 feet to 7,000 feet; 3,840 square miles in the districts of Saharanpur, Muzaffarnagar and Meerut, flat, with average of detail; and if possible 1,536 square miles in Bijnor district, also 1,500 square miles of traversing in advance for next season's work.

To carry out this programme it is evident that the Executive officer, who is responsible for all correspondence and accounts as well, can only direct, control and exercise a general supervision over the whole work, checking personally, only as much as time will permit of, and he is entirely dependent on his assistants for the efficiency and accuracy of the survey.

For the completion of this work the party has been divided into five topographical camps and one traverse camp. The area allotted to each topographical camp is approximately 1,280 square miles, with a staff of ten surveyors.

Each camp officer, after receiving detailed orders from the Executive Officer concerning the execution of the work, is entirely responsible for the management of his section. He apportions the work amongst his staff, and collects all available data, projects and plots these on to his field plan boards, and transfers all existing material from the old maps, and generally completes the plan. He then takes over the instruments, stores, camp equipment and money advances required for himself and his staff, and moves out into his ground, leaving the older hands to begin by themselves; he takes in hand the pupils and novices who require instruction and training. By the time he finishes with these, the others require looking up, and ever after he is constantly moving among his men, examining their work, instructing, surveying difficult bits of ground himself, and checking the delineation of the features shown by the surveyor. He is directly responsible for the accurate survey of the area allotted him. The collection of local information, the correct spelling of all names on the field plan. He has also to attend to the

monthly bills and returns of the section, correspondence, arrangements for conveyance and provisions. In short he is an Executive officer on a small scale.

In Recess the Provincial Officers, under the direction of the Executive Officer, supervise and control the mapping of the country surveyed during the field season, and are directly responsible for its accuracy and correct drawing, and they finally examine the work in detail against the field sheets.

The officer in charge of the traverse camp is responsible for the control and supervision of the work of his chain surveyors and its mathematical calculations. All officers must also be conversant with all the mathematical calculations in use in a Topographical party. The above constitute the chief duties of an assistant attached to a Topographical party, whether he be Imperial or Provincial, employed on the frontier or in India, and there are no other higher or more responsible duties he can be employed on.

Trigonometrical parties, No. 5 Triangulation.

Executive Officer—Royal Engineer.
Assistant—Royal Engineer.
Eight Provincial Officers.

Lieutenants Mason, R.E., Mr. Collins, and Mr. McInnes, on the triangulation connecting the Indian work with the Russian in the Pamirs. Forty trigonometrical stations were fixed, of these nine were observed at by Lieut. Mason and 31 by the Provincial Officers, whose work was as good, if not better, and who were responsible for almost all the reconnaissance connected with the laying out of the triangulation. Mr. Tresham is senior Provincial Officer on Principal Triangulation. This is the most important work in the survey, as on it all other calculations depend. This work was formerly done by Imperial Officers. Mr. Tresham draws Rs. 300 a month, his results surpass all others. Below is shown a comparative statement. The other Provincial Officers are employed on secondary and minor triangulation.

Comparative Statement of principal Triangulation.

Observer.	*Number of Stations.* Observed at	Newly fixed.	Built.	Number of Astronomical Azimuth observed.	Length of Series in miles.	Area in square miles.	Triangular error.	Number of triangles.

No. 17 party—Levelling.

Entirely Provincial, both control and working staff.

This is precise levelling and constitutes the basis for trigonometrical heights.

Tidal party—entirely Provincial.

In the Magnetic party all the observations, with the exception of some repeat stations, are taken by Provincial Officers, who also ably assist the Imperial Officer in the mathematical calculations. Two of the Indian Officers being particularly good.

In the Drawing offices, the compilation of Degree sheets, 1,000,000th sheets, and other small scale maps that the Department produces is done by Provincial Officers, under the direction of the Executive Officer, and they also directly supervise the fair mapping of all these. It will be seen from the above that the Provincial Officer is by no means employed on subordinate duties, and has great responsibility, and that his duties are not below those discharged by the Imperial Officer. If the above duties are considered subordinate, those of the Imperial assistant are also subordinate, for there are no other duties he can be employed on until he becomes an Executive Officer, when he has greater responsibilities, and is responsible for the direction of the work of the party and its general efficiency. Of course, the purely scientific work is quite apart from the duties connected with topographical survey work, and needs the direction of a specialist like Colonel Burrard. But all Royal Engineers are not scientists, they are specially trained in the Department for such work, and their scientific attainments are acquired after joining the service. The more abstruse calculations connected with such work being under the direction of the mathematical expert.

Is it right, that men carrying out such useful duties as those of the Provincial Officer in the Department, and whose services can be even better and further utilised, should be sacrificed or penalised, because of their aspirations and ambitions, so as to justify the maintenance of a highly paid controlling staff.

It is evidence of prejudice to contend that the employment of non-commissioned officers would secure greater efficiency. Sir John Farquharson, giving evidence before the Committee of 1904-05, clearly stated, that the men of the Companies of Royal Engineers, and the civilians were of the artisan classes, and were trained for their duties, which, from the statement given, will be seen to be purely mechanical and nothing like the duties discharged by the Provincial Officer. Two men of this class were imported in 1909, one was drawing at Southampton, 26 shillings a week, and the other, a Corporal of Royal Engineers, something more. They were supposed to be two of the best, we paid them respectively Rs. 400 and 450 a month. One was a typer, another an outliner. They introduced the methods of typing and outlining in use at Southampton. It is strange that this could not have been introduced by any of the many Royal Engineers in the service, who are constantly on leave, and have the run of the offices at Southampton. The imported hands had no educational qualifications, nor had they any artistic talent. They had just specialised in these two classes of work. Their standard of typing and outlining is equalled, if not surpassed, by Indian draughtsmen in Calcutta on Rs. 60 a month. One of them typed a sheet in the Northern Circle, which, when sent to the Headquarters Office, was found to be so bad that two Indian draughtsmen were employed to touch it up before it could be sent to press.

Cadastral work of the kind done at Southampton is carried out entirely by Provincial Officers. The off-set and chain measurement work is done by Indian agency at small cost. Capt. Gwyn has just been appointed Assistant Director of such surveys in Assam on Rs. 1,300 a month. He has five years' service, of which two have been spent on cadastral work. Can it be honestly said that he is qualified? He will have a good efficient staff

of Provincial Officers under him, who will make his task easy. This post, previous to its being abolished, was held by Mr. Shaw, a most efficient officer, who received Rs. 800 a month. Mr. Shaw, after retirement, has been re-employed as personal assistant to the Director, Bengal Surveys. These posts, assistant directors, under Local Governments, should rightly be held by Provincial Officers transferred to Local Governments.

The true and real reason for wishing to abolish the Provincial branch is that already given. Once the department is thoroughly militarised, military discipline will bar the way to the superior grade, and at once constitute it a reserve for a particular class. That the suggestion is actuated by no other interests than those for greater efficiency can hardly be accepted as correct.

The Commission of 1904-05, reported that for the duties required of a Provincial Officer it was necessary to recruit men of even higher educational qualifications than those (said to be) possessed by the officers in the department. The Government of India, on these misrepresentations, in their Despatch to the Secretary of State, excluded the existing incumbents from the benefits of the reorganisation, justifying the exclusion on the report

The Committee recommended that the educational standard should be the examination for entrance into the Roorkee Engineering College. It is certain no non-commissioned officer could pass this test. This test was never adopted, and the private departmental test continued. The fact is, that now that executive appointments are open to Provincial Officers, and it is evident that, given a fair chance and cordial support, they will succeed, the question must naturally arise, from the point of view of economy, if of no other, whether the Government would be justified in retaining men on Rs. 1,000—1,700 a month, for duties that can be discharged by others on Rs. 700—1,250. From a financial and a business point of view it is right and just that an employer should obtain his labour in the cheapest market, and if a high class of technical labour can be obtained in a cheap market, it is but right that this course should be adopted. That the Survey parties can be run efficiently at a less cost is obvious, especially now, when the work is chiefly, if not wholly, revision, and is done on no more scientific lines than formerly.

It would be an injustice, therefore, on the grounds alleged to abolish the superior Indian recruited branch of this service. When there are men in the country capable of discharging the duties of the department on smaller salaries, it would be unfair to sacrifice them, and maintain the higher branch of the service as a closed reserve. For nearly a century the domiciled, and latterly the Indian communities have enjoyed the honour and privilege of being connected with the department. Their fathers and forefathers having left behind them a glorious record of work carried out under most trying and difficult circumstances, with a zeal and devotion to duty unsurpassed in the present day, and now these communities are to be wiped off the records of the department for a class that has no connection with it, or claims on a civil department, and to suit the convenience of a particular class. If such a drastic contingency is contemplated, then it would be only fair to open the Imperial branch to recruitment in this country, the same as the Finance, Accounts, Traffic and Postal. A civil department paid for from civil funds should not exist for the benefit of the Military officer. Such a measure would be against the professed policy of the British Government, and endorsed by the last commission, that is, that the Government of India should keep in view the policy of training in India men qualified to take charge of the higher appointments, so as to avoid as far as possible the necessity for expanding the Imperial cadre. If there is to be no Provincial branch then two-thirds of the strength of this branch of the Department should be recruited in India in equal proportion between Europeans and Indians. The Survey is a Civil Department, are there is really little or no justification for the large military element in it. Even the argument "military considerations" do not justify it, for these can always be amply provided for by the system of tours of service of military officers proposed by Sir John Farquharson, and recommended by the Committee of 1904-05. There is no reason why the Department should not be entirely Civil. The Universities of Europe and India provide steadily men of high scientific attainments for the scientific branches of the Department, why should not the covenanted controlling staff be recruited from men of this class? They would not be as costly as the military staff either who have their own profession. Can it be argued that Mr. de Graffe Hunter is in any way inferior to the military officer in the qualifications required for the Survey Department. His pay is limited to Rs. 1,600, while a military officer with the most ordinary qualifications, because he happens to be military, can rise to Rs. 2,250. There appears to be no justification for such distinctions. A well constituted Civil Department could efficiently meet all the requirements of the Government, both Civil and Military, and could be run far more economically. It is incorrect to say, that only at Chatham can the necessary training be obtained. All Royal Engineers have had to undergo training in the Department and in the Survey Training School. The course at Chatham does not pretend to equip a man for scientific survey practice as done in India. No one contends or disputes the fact, that the general education of the Royal Engineer is superior. That of the three classes of officers—Royal Engineer, Indian Army, and Provincial—he is certainly, on entering the Service, the most qualified, but this does not justify the contention that the other officers are unqualified, and that after they have had the necessary training they are not efficient and have not the technical and professional knowledge required for the work of the Department, and cannot make good Survey Officers.

Colonel C. Strahan, R.E., Surveyor-General of India, at a Conference held at Karachi on the 16th and 17th August, 1895, in the presence of Sir C. Oliphant, K.C.I.E., I.C.S., emphatically stated that no matter whether an officer joined the Survey Department from Chatham, a University, or Indian Army, or Provincial Officer recruited in India, not one of them could be regarded as in any way possessing any knowledge of survey practice as done by the Survey Department unless trained, and he had actually worked in the field and in recess, for at least four years. Admitting that the Royal Engineer has the necessary qualifications, what claim has the Indian Army officer to appointments in the superior Service? He has absolutely no claim whatever, and possesses no special qualifications superior to the Indian recruited Service. The educational and professional tests passed by him are not superior to those passed and possessed by the Provincial Officer. Why should he be eligible for the superior branch and be considered fit, and the Provincial Officer, because recruited in India, be debarred and be considered unfit? A high standard of educational and technical training can be had in India. The surveying and drawing course now given at the Rurki College is of a high standard educationally and technically. It could, if necessary, be further developed.

The training being specialised must though take place in the Department. An efficient training school should be maintained in charge of a thoroughly efficient officer. The mathematical course being in the hands of the expert in the Department.

The educational test for admission into the Department should be the entrance examination for admission into Roorkee, candidates prior to sitting for the examination to be nominated by a Board of officers of the Department, the appointments being distributed equally between Europeans and Indians.

(*18*) *iv* It is unjust that the officers of this Service should be regarded as second class officers in the matter of travelling allowance. This has been a sore grievance as far back as 47 years ago, and its

repeal has been petitioned for at every opportunity. It is to be realised that the Provincial Officer is not a localised District Officer with all conveniences at his disposal that such an officer has at his disposal. His work carries him into all localities, and in these he is an outsider and a traveller, and is put to greater expense than would otherwise be the case. Yearly he is subjected to two journeys of great distances, and for six months of the year is obliged to keep up two establishments. This all entails heavy expenditure which is not covered by second class rates. In the sister Services officers are given first class rates from the day they join or are made permanent.

This year all the officers in my party have been obliged to take advances to enable them to purchase ponies. At the close of the field season they are obliged to dispose of these animals as they cannot afford to keep then in recess, and are so forced to sell at a dead loss. This happens annually. It is absolutely necessary for them to keep ponies if they are to do their work efficiently. First class rates were also recommended by the Surveyor-General in 1895, Government of India Resolution No. 6-46, dated 27th March, but the Government of India refused the concession on grounds that do not hold good from experience.

The Service is a non-graded one, first class rates are admissible under Article 1002 of the Civil Service Regulations, and I think I am right in saying that they would have been sanctioned by Government had the claim been supported by Colonel Longe.

Colonel Longe was an officer who was not favourably disposed to the Indian recruited branch of the Department, and he opposed it. I feel certain that I am correct in saying that it has been opposed chiefly because it would give the officers a better status, and bring them more in line with the Imperial branch. It was a small concession, which would have been a great boon, and saved the officers the annual recurring loss sustained. The Civil Service Regulations say that travelling allowance is given to protect an officer against the extra expenditure incurred when travelling and on tour in the field in the discharge of his duties, and it is not to be considered a source of profit. In the case of the Survey Officer the rates allowed operate the other way, and leave him out of pocket yearly. The Upper subordinate lately introduced in the Department is eligible for second class rates. The Provincial Officer is his superior officer, and should be more favourably treated. It cannot be said that the former on his second class rates is not far more advantageously off, compared to the Provincial Officer of twenty years' service, with family expenses to meet, and larger European wants to supply. This concession would be a great boon in more ways than one. Its bestowal has been opposed chiefly on account of the status it confers, and so its real and pressing need finds no sympathy.

(*19*) v. *CONDITIONS OF LEAVE.—Provincial.*—The leave rules for Indian recruited Services should be improved. As the Indian Service leave rules at present stand very few officers, especially if married, can afford to take long leave. All long leave is on half salary, calculated on the average salary drawn during the past three years. Furlough can be taken at intervals of ten years and eight years, or two years combined after 18 years.

Medical leave is most difficult and troublesome to get in India, and officers, as a rule, are backward in availing themselves of medical leave for fear it should militate against their fitness for duty. The maximum amount of medical leave available is three years, but not more than two years can be taken at a time, the first fifteen months on about three-quarter pay and the balance on quarter pay, and no officer can have leave on medical certificate out of India more than twice.

Leave on private affairs can be had at intervals of every six years, but does not count towards furlough or service.

Privilege leave can accumulate up to three months and can be combined with other leave, but the total period of leave must be for not less than six months.

Officers of the Indian recruited Services are on small salaries and cannot afford to be on long periods of leave on half pay. It is sometimes stated that a man of the Indian Service has not the go and energy of the imported Service man. But when it is remembered that the latter, owing to his better rate of pay, can live better, and at the same time can afford to put by to enable him to go for a change and rest whenever his system needs it, and returns to duty a new man, there is nothing in the statement that is astonishing. Any leave statement will show the small amount of leave taken by officers of the Provincial Service, in fact it is a wonder that the man of this country can hang out as long as he does. If he is not as energetic, he knows that he has to husband his energy and vigour to the end of his career, dreading a breakdown and consequent leave on small pay.

I would recommend that privilege leave be allowed to accumulate up to six months. If not, that furlough up to an aggregate of five years be allowed at intervals of from three to six years, and that a commutation of furlough due for half the amount be allowed up to a total of nine months. That is, if an officer has, say, twelve months' furlough due to him on half-pay, he may be allowed to commute it to six months on full pay. This would be a great boon, and would tend to greater energy and efficiency, and would also enable an officer to give his family a change. Other leave to stand as at present, but the total aggregate leave, whether on furlough or medical certificate, not to exceed eight years.

(20) vi. The application of the term "Provincial" to the Indian recruited branch of the department is a misnomer. It is not recruited for work in any particular "Province," but is liable for duty in any part of India and Burma and across the frontier. Its cost is an Imperial charge, and not Provincial. It is part of an Imperial department and should never have been classified as Provincial. My service attaches great importance to the necessity for exercising this nomenclature, and also the prefix "extra." We are not "extra" or waiting officers outside the requirements of the department. We are in essence part of the service and of its active strength. The term too is useless and meaningless, and has come to be associated only with ideas of inferiority and subordination. The old designations "senior" and "junior" are preferable. The officers of the "junior" division being designated Assistant Superintendents, and those in the "senior," Deputy Superintendents.

The Provincial branch of this department has been represented as a discontented service. The grievances and disabilities under which this branch of the service has been suffering, without any hope of redress, has been more than enough to cause discontent. There is a feeling in the service that its advancement and ambitions have no sympathy or support from the Imperial branch, and are even resented. The deliberate exclusion of the Provincial officers from legitimate appointments, the misleading statements made before the Committee of 1904-05, on which there was no Provincial representative, the exclusion of the service from the benefits of the reorganisation, on inaccurately alleged statements of inefficiency and ability, the reflection cast on the members by the creation of a new Provincial service, the humiliating conditions under which senior officers of years of experience and training found themselves placed in subordination to the most junior inexperienced Imperial, and the attitude of "the officer to the subordinate" experienced in all relations with the Imperial officers, the discourteous improper treatment received at the hands of some of them, the constant discrediting of the service, the want of sympathy, kindly feeling and fairness have all been enough to try endurance and patience to breaking-point. When, year after year, Provincial officers realised that similar services were being improved, and that these services had the support of their superior officers, and that only humiliations and discredit was their lot, it was only natural for them to grow restive under the conditions and

to seek measures for the redress of grievances. I believe in no other department is the feeling between Imperial and Provincial officers so strained as in the Survey, and it is not possible for such sentiments to exist without cause. The relations are not cordial; there are no exchange of courtesies. Throughout, one realises that the dominating idea is one of aloofness and exclusiveness. The military officer, trained in the Army, seems to have but one idea pervading his relations with the Provincial officer—that of "officer" and "rank and file," and the want of recognition on his part of the status of Civil officers recruited in India and holding recognised positions. In other Civil departments there is no exclusive military controlling staff, and in those in which there is a mixed staff the military element is in the minority, and so there is not this extreme aloofness, and this idea of "subordinates." It is for these reasons that the suggestion has been put forward that the department should be divided into Civil and Military. The Military Survey Department could form a branch of the Military Works Service, could be taken over entirely by the military department, and controlled by them, its strength being regulated by their needs. The Civil department would be entrusted with all surveys within India, topographical, cadastral, and large scale for towns, and be constituted on the lines of P.W.D. Its staff would be entirely civil, recruited one-third in England and two thirds in India. The cost of such a service would not work out to be as expensive as the present one. It would relieve local Governments of all Settlement Surveys, and provide for their requirements maps based on scientific survey, and so supply for the whole of India a complete set of accurate serviceable records.

The existing department could be split up on the above lines and allotted to local Governments according to requirements. Each local Government would have a Director of Surveys who would be a Civil servant, and an Assistant Director promoted from the officers recruited in India, the large majority of whom would be the executive officers in actual charge of survey operations.

The headquarters of a department constituted on the above lines would be at Delhi, and the administrative head, a Secretary to the Government of India in the Revenue and Agricultural Department. All orders for the direction and control of the work on uniform lines, its mapping and reproduction, the head office would be responsible for. The directors would meet in conference once a year to discuss all matters connected with the direction of survey work.

Such a Department would be responsible for all surveys within the internal borders of India. Those across the frontier being delegated to the Military branch.

If a Department on the above lines is not approved of by the Commission, I am directed to ask that whatever be the final constitution of the Department the administrative head should be a civilian. It would be paying too high a tribute to the altruism of human nature to expect Military Officers to rise superior to bias and prejudice in favour of their own class in the administration of the Department. At present the Department has at its head a most able officer, and one in whom all branches of the Service have the utmost confidence combined with great regard and esteem. The present administrative head has endeavoured to the best of his power to deal fairly with the Provincial branch of the Department and to remedy, under difficult conditions, some of the most pressing grievances and disabilities introduced by the prejudiced administration of past years. But what hope or guarantee is there that his successors will follow in his lines? In fact, the fear is that on his retirement the old order of things will be introduced, or at least an endeavour made to do so, and the Indian recruited branch reduced to a subordinate position. The Provincial branch of the Service has much to be thankful for to Colonel Burrard, and had the Government of India sanctioned the scheme of redress recommended by the Departmental Commission of Enquiry of 1910 there would have been fewer grounds for discontent with the recent reorganisation. But the Government of India, while admitting that in justice to this branch of the Service the time scale of pay should be applied from first year of service, allowing three years for probation, fixed an arbitrary date, 1st March, 1912, for its application, and hereby penalised in emoluments a large number of officers. It has to be borne in mind, moreover, that had the Service not been barred from the benefits of the reorganisation in 1909 they would mechanically have come under the time scale of pay in that year, so that the introduction of an arbitrary date some years hence could not be regarded as a measure of just and fair redress. The plea advanced by Government for this policy was economy, which can hardly be accepted as being reasonable and valid when one considers the lavish and generous manner in which the Imperial branch has been treated. Whenever it is necessary to exercise economy in the Department it is usually the branches recruited in India that undergo the clipping.

It is to measures of the above nature that all the discontent is attributable, and to the distinctions introduced in 1895. The change seriously affected the junior division (present Provincial). It was left worse off by about quarter of a lakh of rupees, and its status irretrievably lowered. In the past junior officers who have risen to the senior division by merit could not be regarded or spoken of as inferiors and subordinates. They belonged to the same Service as the Imperial Officer, and were officially and socially his equal, and were secured against invidious distinctions in treatment. In those days it was not considered degrading for a junior Imperial Officer to serve under an officer of the junior division who had been promoted to the senior, nor was it possible to place officers holding posts equivalent to Extra Deputy Superintendents with years of service and experience in subordination to the most junior Imperial Officers. It is this state of things, and the desire to keep down the ambitions and aspirations of the Indian recruited branch, that is responsible for all the discontent in the Department. All we desire is fair play, just impartial administration and proper treatment.

MR. J. O. GREIFF called and examined.

70201. (*Chairman.*) The witness had been in the Service 22 years. He was at present Deputy Superintendent in the charge of No. 3 party.

70202. The scheme put forward in the written statement was based on the assumption that there was a superfluity of Military Officers in the Department. The actual reason for the increase of the Imperial branch from 40 to 55 was due to the report of 1904-05, which condemned Provincial Officers as incapable of discharging responsible duties, and therefore necessitated two and three Imperial Officers being attached to a party. The unfavourable statements in the report had been discredited. He agreed that if it were found impossible to reduce on military grounds the military element his scheme would have to undergo modification, but he urged that military considerations had always in the past regulated the military element, and the necessity for so large a number had not been felt, part of the cadre always being civil—*vide* Table 1 in written statement. Even should there be at any time an abnormal demand for Survey Officers for Military requirements, Provincial Officers were available, they had proved their ability for duty with expeditions and political missions—*vide* list given in the written statement. They considered it a grievance that this avenue to distinction should now be closed to them.

70203. He was aware of the fact that in all

European countries survey work was directed by Military Officers. One reason why survey work in India should be treated in a different way was precedent. Civilians had been connected with the Department in India for nearly a century, and the records of the Department proved their aptitude and fitness for the work. The Survey Departments in the Colonies were not entirely Military, and the United States Survey Department was entirely civil.

70204. He maintained that the pay and prospects of the officer in the Provincial Service should be brought up to something similar to those of Provincial Officers of the Public Works Department. He agreed that whereas an Assistant Engineer in the Public Works Department rose to a maximum salary of Rs. 535 he was proposing a maximum salary of Rs. 700 for the officer of corresponding rank in the Survey Department, but he urged that the prospects had to be sufficient to attract men of the proper class as every Provincial officer of the Survey Department, however efficient, could not hope to get one of the selected appointments.

70205. The standard of examination for entrance had been lowered within recent years, and the right class of man was not being attracted to the service; notwithstanding the fact that the prospects of the service had been materially improved, still they had not been brought into line with other similar services. The remedy was to raise the qualification for entry and make the prospects more attractive. Selfishly speaking he would naturally like to reserve all the appointments in the department for the domiciled community, but in fairness the half proportion between Anglo-Indians and Indians had been agreed to to satisfy the claims of the latter, depending of course on the methods of recruitment for the future. If competitive examination was to be the sole test for all public services, his service would of course come under the same category. He thought survey life being an outdoor strenuous one appealed more to his community than it did to the Indian. Capacity to pass a competitive test of a high standard was not all that was required of an officer in the Survey Department. What a man required was a good general education, a certain amount of practical knowledge, and a great deal of grit, character and physical endurance. The Anglo-Indian community had those qualities. Out of the Indians who had joined, about one-fourth had either resigned, or had been forced to leave on account of physical breakdown.

70206. Indians had been admitted to the Department since 1891, and there had not been sufficient opportunity to test them on work demanding any considerable measure of responsibility.

70207. He did not think there would be a very heavy increase of expenditure on account of the enlargement of the Provincial Service which he had recommended from 87 officers to about 120, if the upper subordinate service were abolished, and the department constituted somewhat on the lines he had proposed.

70208. The dissatisfaction* in the department arose out of the report of the committee of 1904 and 1905. The Provincial Service was not represented on that committee, and statements were made to the committee which were unfavourable to the Provincial branch, and which the Provincial branch had no means of refuting. Those statements had become public, and had prejudiced the reputation of the community. Further dissatisfaction had been caused by the loss of back pay and the unequal treatment meted out to Provincial Officers at the more recent reorganisation of 1913. The reorganisation was given effect to from 1st March, 1912, instead of from 1st August, 1909, and in the application of the time scale for pay, the principle of the system had been violated, service for increment being reckoned from 1st March, 1912, instead of from date of first appointment. He gave as an example his own case. Had the reorganisation been sanctioned with retrospective effect from 1909, and time scale applied from date of first appointment, he would have drawn pay at Rs. 500 from 1st November, 1909, and Rs. 550 from 1st November, 1912; by the reorganisation, he drew Rs. 500 from 1st March, 1912, and would draw Rs. 550 from 1st March, 1915. All officers drawing Rs. 300 pay and upwards on 1st March, 1912, with a few exceptions, and some even below Rs. 300, had been more or less similarly affected. Lastly, it was felt that the major charges allotted to the Provincial Service should be incorporated in the Imperial service.

70209. (*Mr. Madge.*) One of the reasons for suggesting the transfer of the Survey of India Department to the Home Department, with a Civilian head, was that under such conditions the interests of the members of the service recruited in India would probably receive more favourable consideration. Personally, however, he did not hold that view.

70210. A number of Provincial Service officers in former days rose to very high distinction and important offices in the department. That kind of career had not been by the recent reorganisation entirely closed to the Provincial Service, but their grievance was that the executive appointments allotted to Provincial Officers were regarded as part of the Provincial cadre, whereas under the old system they would have been regarded as belonging to the Imperial cadre.

70211. Relative ranking had not been given effect to insomuch, that in the departmental official lists of officers the position of Provincial Officers, who held relative rank with the Imperials, had not been defined as had been done in the case of the "mathematical adviser," who was outside the Imperial cadre, but against whose name it was stated that for official purposes he ranked below officer so and so.

70212. (*Mr. Fisher.*) If certain selected Provincial

* The witness afterwards asked to have the following note added on this point:—

"I intended to say that the discontent was due to the time scale of pay not having been applied from the first year of service, and with retrospective effect from the 1st August, 1909, the year of the inauguration of the new Service, whereby the Service has suffered a considerable loss of back pay. The point really is that when the future of the Department was under discussion by the Departmental Committee in 1910, the reorganisation of the Public Works, Forest and Telegraph Departments had just been effected, and many of the officers who gave evidence before the Committee urged the adoption of some such scheme as would have brought the Provincial Survey Service into line with these sister Services, but abandoned these schemes when they were given to understand by the committee that it would be possible to afford immediate relief by the exercise of Clause 13 of the Government of India Order No. 527, dated 24th July, 1909, which provided for the transfer of officers from the old to the new Service. The Government of India, however, ruled that it was not possible to exercise this rule in so wholesale a manner, and that the recommendations of the committee would, in any case, require the sanction of the Secretary of State. This caused considerable delay, and the scheme was only sanctioned in 1913 with retrospective effect, not from 1909, but from the 1st March, 1912, and even then not on the true principle of a time scale pay, whereby the Service has lost considerably in emoluments.

"The dissatisfaction I referred to is also due to matters of treatment. This concerns chiefly the more junior officers of the Service, and may be attributed to want of experience and to a want of a knowledge of the different conditions that prevail in a Civil Department as compared with a Military. As an instance in point, just before leaving Saharanpore I received the following information. A junior Imperial Assistant in one of the parties passed an order, without consulting the officer in charge, to the effect that when he came into a room all Provincial officers should stand up, and that they must do so whenever addressed, and that all their work and papers should pass through his hands. The Provincial officers protested and appealed to the executive officer, who cancelled the order. Imagine the mischief that might have been caused by such an order had it been upheld. A similar incident occurred when I was an assistant in No. 18 Party many years ago. The senior officers generally are much more reasonable."

Officers were brought into the Imperial Service at the bottom of the list at an early period of their career, the change of system would be gratefully accepted by the members of his service, at the same time he would not debar the senior officers at the top of the Provincial Service from this preferment, if they were qualified.

70213. It was a grievance with his colleagues that Imperial officers of five or eight years' service and even of less years' service were entrusted with the charge of topographical parties, when senior Provincial officers, who had a right to these posts, were available, because they considered that Provincial Officers of 20 odd years' service were quite capable of undertaking such duties.

70214. (*Mr. Sly.*) The demand made before the Committee in 1910 by the Provincial Service was for ten executive charges, and not five.*

70215. He agreed that a Provincial Officer promoted to an executive charge could not be transferred to the Imperial Service at the initial Imperial rate of pay if he were already in receipt of a higher salary.

70216-743. He did not think the suggestion that the Provincial Service should be abolished, and that there should be an Imperial Service and an upper subordinate service, would make for the good of the Department, because an upper subordinate service would not be sufficiently qualified for the duties of supervision. The upper subordinate and lower subordinate services were also too proximate to entrust the control of one to the other.

(The witness withdrew.)

* The witness afterwards wrote as follows:—"Ten posts were transferred from the Imperial Service to the Provincial by the policy of the Commission of 1886, this number being one-fifth of the cadre, and this number was demanded by the Provincial Service before the Committee of 1910. A very important point to note in this connection is that the number of 'Senior' posts allotted to the 'Junior' division by the old system was *never* regulated by the number of executive charges in the Department, but by the total strength of the 'Senior' division, approximating to about one-fifth of the total number. So if 55 officers be strength of the Imperial cadre, 11 of these posts would, according to the old system, belong to the 'Junior' division. This is the number asked for in my written statement."

LIST OF APPENDICES.

PAGE.

I.—Supplementary Statement put in by Colonel S. G. Burrard, C.S.I., R.E., F.R.S., relating to the reorganisation of the Survey of India Department 394

II.—Statement of the Civil Appointments on Rs. 200 a month and over held by Europeans, Anglo-Indians, and Indians on the 1st April, 1913, in the Survey of India Department 396

III.—Officials and non-officials who furnished written evidence to the Royal Commission in connection with their enquiry into the Survey of India Department, but who were not orally examined 396

IV.—Rules for the appointment of Military Officers to the Imperial Service of the Survey of India 397

V.—Rules for the appointment of Officers to the Provincial Service of the Survey of India ... 397

APPENDIX I.

SUPPLEMENTARY STATEMENT PUT IN BY COLONEL S. G. BURRARD, C.S.I., R.E., F.R.S., RELATING TO THE REORGANISATION OF THE SURVEY OF INDIA DEPARTMENT.

(Referred to in Paragraph 70199.)

The effects of the recent reorganisation (1913) upon the pay and prospects of Provincial Officers of the Survey of India are illustrated in the following tables:—

(*1*) Effect of introduction of incremental time-scale salaries for Extra Assistant Superintendents.

(*2*) Effect of increasing the number of Extra Deputy Superintendents from five to ten and of creating seven charge allowances.

(*3*) Effect upon pensions of increasing the salaries of Provincial Officers.

(*4*) Effect upon travelling allowances of the recent reorganisation.

(*1*) *Effect of introduction of time-scale salaries for Extra Assistant Superintendents.*

(*i*) Table showing the average age of Provincial Officers drawing different salaries in different years, showing the improved prospects due to the reorganisation.

Salary.	1901.	1913.	1928.
Rs.	Age.	Age.	Age.
350	47	31	29
400	50	35	32
450	52	39	35
500	53	42	38

(*ii*) Table showing numbers of Provincial Officers who as Extra Assistant Superintendents draw salaries of Rs. 500, 550, and 600

Salary.	Before the Reorganisation (1892-1912).	After the Reorganisation.			
		1913.	1915.	1920.	1925.
Rs.					
600	None	2	6	5	22
550	3	6	9	13	19
500	6	9	14	18	37

The cases of a few individual officers will now be considered. I will firstly take the case of Mr. P. A. T. Kenny (aged 35), as he is the officer who has complained in the strongest terms of the inadequacy of the benefits conferred upon him by the reorganisation of 1913.

(*iii*) Statement showing the effect of the 1913 reorganisation in Mr. P. A. T. Kenny's case:—

Pay.	Year in which Pay is reached.	
	Under Old Scheme.	Under New Reorganisation.
Rs.		
350	1912	—
400	1921	1912
450	1926	1915
500	1928	1918
550	1930	1921
600	—	1924
650	1931	1929
800	1932	—
1000	—	1932
Approximate Pension	344	398 Retires 8th April, 1933.

In 1912 his pay has been increased 14 per cent.
,, 1915 ,, ,, ,, 28 ,,
,, 1921 ,, ,, ,, 37½ ,,
,, 1924 ,, ,, ,, 50 ,,

I will now take the cases of Mr. C. E. C. French (aged 38), Mr. E. B. West (aged 34), and Mr. F. H. Grant (aged 28), as these officers were put forward in 1910 as typical instances.

(*iv*) Statement showing the effect of the 1913 reorganisation in Mr. C. E. C. French's case:—

Pay.	Year in which Pay is reached.	
	Under Old Scheme.	Under New Reorganisation.
Rs.		
400	1912	—
450	1921	1912
500	1925	1915
550	1927	1918
600	—	1921
650	1928	1926
800	1929	—
1000	—	1929
Approximate Pension	340	393 Retires 16th Mar., 1930.

In 1912 his pay has been increased 12½ per cent.
,, 1915 ,, ,, ,, 25 ,,
,, 1921 ,, ,, ,, 33 ,,
,, 1924 ,, ,, ,, 33 ,,

(*v*) Statement showing the effect of the 1913 reorganisation in Mr. E. B. West's case:—

Pay.	Year in which Pay is reached.	
	Under Old Scheme.	Under New Reorganisation.
Rs.		
300	1912	—
350	1919	1912
400	1925	1915
450	1929	1918
500	1932	1921
550	—	1924
600	—	1927
650	—	1933
Approximate Pension	247	313 Retires 23rd July, 1934.

In 1912 his pay has been increased 17 per cent.
,, 1915 ,, ,, ,, 33 ,,
,, 1921 ,, ,, ,, 43 ,,
,, 1924 ,, ,, ,, 57 ,,

(*vi*) Statement showing the effect of the 1913 reorganisation in Mr. F. H. Grant's case:—

Pay.	Year in which Pay is reached.	
	Under Old Scheme.	Under New Reorganisation.
Rs.		
200-10-250 drawing 210	1912	—
300	1921	1912
350	1928	1915
400	1933	1918
450	1936	1921
500	1937	1924
550	1939	1927
600	—	1930
650	—	1939
Approximate Pension	263	313 Retires 10th August, 1940.

In 1912 his pay has been increased 43 per cent.
,, 1915 ,, ,, ,, 46 ,,
,, 1921 ,, ,, ,, 50 ,,
,, 1924 ,, ,, ,, 67 ,,

(2) Effects of increasing the number of Extra Deputy Superintendents from five to ten and of creating seven charge allowances.

The following table shows the pay of the posts of Extra Deputy Superintendents to which all officers of the Provincial Service recruited subsequent to 1888 were and are eligible by selection:

	Before the Reorganisation.	1913 and henceforth.
Rs.		
1000	None.	2
850	None.	2
800	2	None.
750	None.	3
650	3	3

In place of five posts with salaries averaging Rs. 710 there are now ten posts with salaries averaging Rs. 790 for which officers recruited since 1888 are eligible.

(3) Effect upon pensions of increasing the salaries of Provincial Officers.

An officer's pension is half the average salary he has received during the last three years of his service.

The number of officers drawing salaries of and above Rs. 500 has been largely increased by the recent reorganisation, and will now be continually increased as years pass. The augmentation of pensions by the recent reorganisation may be illustrated by the following table.

Maximum salaries open to Provincial officers who have been recruited since 1888:—

	Before the recent Reorganisation.	1913.	1915.	1920.	1925.
Rs.					
1000	None.	2	2	2	2
700 to 900	2	5	5	5	5
600 to 700	3	5	9	8	25
550	3	6	9	13	19
500	6	9	14	18	37

Under the recent reorganisations of the Survey of India Department the average pay and pension of an average Imperial officer have not been altered, but the average pay and pension of an average Provincial officer have been considerably increased.

(4) Effect upon travelling allowances.

Number of Provincial officers who are allowed first-class travelling expenses by rail and steamer, and who are allowed to draw a daily allowance of Rs. 4s. or more when on tour:—

Before the recent Reorganisation.	1913.	1915.	1920.	1925.
14	27	39	46	88

In addition to the above increase in travelling allowances, Government tents are now being issued for the use of officers, whereas formerly officers had to purchase their own tents.

Formerly, moreover, officers had to pay for the conveyance of their horses by rail and steamer; now rail and steamer fares for the conveyance of horses are being granted.

In the statements of grievances put forward in 1908 and 1910, the grievances concerning tents and conveyance of horses were emphasised. These grievances have been entirely removed.

The three Circle Drawing Offices.

With reference to the three Circle Drawing Offices which Mr. Biggie thought were not proper charges and which I considered were important posts, I ought to explain that these three Circle Drawing Offices are recent creations and have not always existed. The facts concerning them are as follows:—

In 1909 three Circle Drawing Offices were created for the first time, and charge allowances attached to them.

In August, 1910, the Provincial Service petitioned that these three Drawing Offices should be made into executive charges to rank with the charge of parties.

In November, 1910, a Departmental Committee of which two leading Provincial Officers were members recommended that these three Circle Drawing Offices should be made into executive charges to rank with the charge of parties.

In 1913 the Government acceded to the request of the Provincial Service and converted these three Circle Drawing Offices into executive charges.

In 1913-14 I have heard this step invariably spoken of with approval. I have never heard any objection raised to it except that of Mr. Biggie in his evidence before the Royal Commission.

With reference to the question put to me as to why the salary of the Survey Officer should be greater than that of the Public Works Department Officer I have the honour to invite attention to para. 5 of Despatch 272, of 1909, dated the 25th November, 1909, from which the following extract is made:—"5. Your Lordship has drawn our attention to the fact that the average cost of the appointments of Imperial Service Officers under our original proposals amounted to Rs. 1,268 a month, being slightly in excess of the existing scale of Rs. 1,253, and considerably in excess of the scale applicable to officers of the Royal Engineers employed in the Public Works Department and in the Military Works Services. We are not aware what figures have been placed before your Lordship as representing the average pay of officers of the two latter Services. The emoluments of officers of the Military Works Services are based to a large extent on their regimental pay, and it is difficult to make an accurate comparison between the average pay drawn in those Services and the average pay of a Service under a time scale, such as that proposed for the Survey of India. It must be remembered also that an officer of the Survey of India loses the chances of obtaining high army rank, which are open to officers of the Military Works Services. Moreover, in connection with the reorganisation of the Military Works Services, which was effected in 1905, it was recognised that it was necessary to keep the pay in the junior ranks below that which officers would obtain in the corresponding grades of the Public Works Department, so that Royal Engineer Officers might be induced to volunteer readily for service in that Department. The average pay of the Public Works Department calculated on the same principles as those adopted in the case of the Survey of India is about Rs. 1,219 a month. It is, however, impossible to estimate the relative attractions of the two Services, solely by reference to the arithmetical averages. It appears from some detailed calculations, which have been made, that while the pay proposed for officers of the Survey of India is on the whole higher than that of officers of the Public Works Department for the first 20 years of their service in the Department, the average pay drawn by officers of the Public Works Department during the later years of their service is considerably higher than that of officers of the Survey of India of the same standing. The inferiority of the Survey of India during the later years of service is due to a fact which is of material importance in comparing the conditions of the two Services as a whole, namely, that the Survey of India contains only one prize post, that of Surveyor-General, and it will under our proposals contain only three posts on pay exceeding Rs. 2,000 a month. In the Public Works Department, on the other hand, there are a number of valuable posts open to senior officers, such as those of Chief Engineers, Secretaries to Government, Managers of Railways, and so on. Moreover, it is often possible for distinguished officers of the Public Works Department to obtain further employment on retirement, while the work and training of an officer of the Survey of India, who

is compelled to retire at the age of 55, are such as to render it very difficult, if not impossible, for him to obtain employment after leaving our Service. For the scientific work of the Survey of India, the best Royal Engineer Officers available are required, and the ordinary work of the Department is carried on for a great part of the year in circumstances involving greater isolation and hardship than falls to the lot of most officers of the Public Works Department. For these reasons, we consider that in order to attract the same class of officers, it is necessary that the scale of pay of the Survey of India should be rather higher than that of the Public Works Department during the earlier years of service, and that a slight excess in the average pay of the Survey of India over that of the Public Works Department is justifiable, as it merely represents a slight superiority in the position of the junior ranks to compensate for a decided inferiority in the prospects open to senior officers."

APPENDIX II.

Statement of the Civil Appointments on Rs. 200 a Month and over held by Europeans, Anglo-Indians, and Indians on the 1st April, 1913, in the Survey of India Department.

Pay.	Number of Employés in each Grade or Class.															
				Hindus (including Sikhs and Parsis).												
	Total.	European.	Anglo-Indians.	Brahmans (including Shenvis).	Kshatryas.	Kaiyasthas (including Prabhus).	Baniyas and Vaisyas.	Sudras.	Other Hindus (*i.e.*, other than those shown in cols. 5 to 9). APPENDIX III.

Officials and Non-officials who furnished written Evidence to the Royal Commission in connection with their enquiry into the Survey of India Department but who were not orally examined.

1. Colonel T. F. B. Renny-Tailyour, C.S.I., R.E., Superintendent, Southern Circle, Survey of India.

25. Major F. W. Pirrie, I.A., Officiating Superintendent, Survey of India.
26. L. J. Pocock, Esq., Extra Deputy Superintendent (Retired).

APPENDIX IV.

Rules for the appointment of military officers to the Imperial Service of the Survey of India.

1. Officers of the Royal Engineers on the Indian Establishment and of the Indian Army are eligible for appointment on probation to the Survey of India provided they have not more than six years' Army service. Officers will be confirmed or reverted to military duty, on the recommendation of the Surveyor-General, at any time within two years of their appointment on probation. They may revert at their own request at any time before they are confirmed.

2. The ordinary proportion of appointments for the two services will be three Royal Engineer Officers to one Indian Army Officer.

3. Applications for appointments to the Survey of India will be forwarded to the Surveyor-General through the Military Secretary to the Commander-in-Chief. The Surveyor-General will maintain two lists of candidates, one for officers of the Royal Engineers and the other for officers of the Indian Army. The Surveyor-General will make such enquiries as he thinks necessary regarding applicants for appointment, and will enter in the lists the names of such officers only as he considers suitable for employment in the Survey of India. On the occurrence of a vacancy in the Department, the Surveyor-General will nominate an officer from the lists with due regard to the provisions of Rule 2. The appointment will be made by the Government of India, who reserve to themselves the right to modify the Surveyor-General's proposals as they think fit.

4. Officers of both services, after confirmation in the Department, will be graded on one list in accordance with the date of their first commissions.

5. These rules are subject to alteration from time to time at the discretion of the Government of India.

APPENDIX V.

Rules for the appointment of officers to the Provincial Service of the Survey of India.

1. The Provincial Service of the Survey of India is open only to persons who are natives of India, as defined in the Statute 33 Vict., Cap. 3, Section 6.

2. There will be four methods of admission to the Service :—

(1) By competitive examination of candidates nominated by the Surveyor-General (Rules 3-6);

(2) By direct appointment of persons possessing certain educational qualifications (Rules 7-8);

(3) By promotion from the Upper Subordinate Service (Rule 10);

(4) By transfer from the existing service (Rules 12-13).

3. The Surveyor-General will, about the beginning of April in each year, publish a notice specifying the number of vacancies offered for competition.

4. Only candidates who have been nominated by the Surveyor-General will be permitted to appear at a competitive examination, for admission to the Service. For the present no candidate will be nominated for the competitive examination who does not possess the qualifications required for admission to the entrance examination of the Thomason Civil Engineering College or equivalent qualifications in Provinces other than the United Provinces or the Punjab. Persons desirous of appearing at the competitive examination must apply to the Surveyor-General, Calcutta, when a form of application will be supplied. On receipt of the form duly filled in and after such further enquiries and examination as he may consider necessary, the Surveyor-General will, if he thinks the applicant suitable for service in the Survey of India, give him a nomination which will entitle him to appear at a competitive examinaton to be held under the following rule.

5. The Surveyor-General may arrange to have the competitive examination conducted by the authorities of such College or Colleges as he may select, or a special examination of nominated candidates may be held by the Survey Department. If only one examination is held in a year those candidates who obtain the greatest number of marks will be appointed in order of passing up to the number of probationary appointments offered for competition. If more than one examination is held in the same year, the Surveyor-General will allot the number of appointments to be given at each examination, and the candidates who stand highest on the list of passed candidates at each examination will be selected up to the number of vacancies allotted to the examination for which they appear.

6. Candidates selected after examination under the foregoing rules will be on probation for three years, and will receive salary at the rate of Rs. 100 per mensem for the first year, Rs. 125 per mensem for the second year, and Rs. 150 per mensem for the third year.

7. The Surveyor-General may, subject to the approval of the Government of India, appoint on probation a candidate who has graduated, taking mathematics as a subject for his degree, or who has passed as a Bachelor of Engineering or possesses the Roorkee Engineering College certificate or other equivalent qualification. Such a candidate must be under 24 years of age.

8. Candidates appointed under Rule 7 will be on probation for two years and will receive a salary of Rs. 100 per mensem for the first year, and Rs. 150 per mensem for the second year.

9. A candidate appointed on probation may be discharged by the Surveyor-General at any time during the period of probation, and no probationer will be permanently appointed to the Provincial Service until he has completed his period of probation and has satisfied the Surveyor-General that he is duly qualified and that his health is good. The term of probation may be prolonged by the Surveyor-General to the extent of any period or periods of leave passed on medical certificate. Probationary service, if followed by a permanent appointment, will count for leave and pension.

10. The Surveyor-General may, subject to the approval of the Government of India, promote specially deserving officers from the Upper Subordinate Service to the Provincial Service; ordinarily no such promotion will be given to any officer after he has attained the age of 40 years.

11. On being permanently appointed to the new Provincial Service after completion of the periods of probation prescribed in Rules 6 and 8, or on promotion from the Upper Subordinate Service under Rule 10, an officer will be designated Extra Assistant Superintendent and will receive pay at the rate of Rs. 250 per mensem, rising by triennial increments of Rs. 50 to Rs. 600, subject to the condition that the Surveyor-General shall have power to stop any increment for unsatisfactory work or conduct. The Service will also include a number

of posts of Extra Deputy Superintendents, promotion to which will ordinarily be made by selection from among the Extra Assistant Superintendents on Rs. 600. The Government of India, however, reserve the right to select any Extra Assistant Superintendent for promotion to the rank of Extra Deputy Superintendent.

At present the following posts of Extra Deputy Superintendents have been sanctioned :—

			Rs.		
4	posts	on	650	per	mensem.
2	,,	on	700	,,	,,
2	,,	on	800	,,	,,
2	,,	on	1,000	,,	,,

12. Members of the existing Provincial Service appointed after 1st May, 1905, may at the discretion of the Surveyor-General be transferred, subject to such tests (if any) as the Surveyor-General may prescribe, to the new Provincial Service, and on such transfer will receive their present rates of pay (including such increments as they may earn under the existing scheme) until they have completed three years from the date of their present appointment to the existing service, and thereafter will receive pay at the rate of Rs. 250 subject to the increase provided by Rule 11 above.

13. The Government of India may at any time transfer any number of the old Provincial Service to the new Provincial Service under such conditions as they think fit.

INDEX.

(The numbers refer to paragraphs.)

Survey of India Department.

A

Administrative Posts:
Nature of, *Lenox-Conyngham* 70069
Number and pay excessive, and decrease advocated, *Grieff* 70200 (16)

E

Europeans, civil appointments on Rs. 200 a month and over, held by, 1st April, 1913 ... ... p. 396

Ewing, A., evidence of 70089–70109

Extra Assistant Superintendents, Provincial Service:
Designation "Extra" a misnomer, and should be excised, *Greiff*... ... 70200 (14) (20)
Duties, and comparison with those of Assistant in Imperial Service, *Lenox-Conyngham*... 70052
Effect of introduction of time-scale salaries for, *Burrard* ... ... p. 394
Reply to complaint *re* designation, *Burrard* 70165

Extra Deputy Superintendents, effect of increasing number, *Burrard* ... ... p. 395

F

Family Pension Fund, establishment for Indian recruited services advocated, and scheme, *Greiff* 70200 (16)

Furlough (*see under* Leave).

G

General Provident Fund:
Insufficiency of provision, *Greiff* ... 70200 (16)
Permission to officers to join, would be appreciated, *Lenox-Conyngham* 70062, 70067
not Subscribed to by majority of Provincial Service officers, *Aulad Hossein* 70130
Subscribed to by members of Provincial Service, *Lenox-Conyngham* 70067

Greiff, J. O., evidence of 70200–70216

Gwyn, Captain A. H., I.A., evidence of 70077–70088

H

Hindus, civil appointments on Rs. 200 a month and over, held by, 1st April, 1913 ... ... p. 396

I

Imperial Service:
Allotment of one-fourth vacancies to Indian Army officers approved, *Burrard* ... 70167
Distribution of officers, 1st July, 1913, *Greiff* 70200 (16); p. 383
Division of service into Provincial and (*see under* Division of Service, *etc.*).
Form part of war reserve, *Burrard* ... 70159, 70167
Formation of, approved, but number of officers excessive, *Ewing* ... 70095, 70101, 70108, 70109
Increase in Cadre:
1895–1910, reason, *Lenox-Conyngham* ... 70064
Underlying principle of, that no Provincial officer should have even temporary charge, *Greiff* 70200 (9) (16), 70202
alleged Need for military officers owing to need for military reserve for military expeditions, reply to, *Greiff* 70200 (16)

Imperial Service—*continued.*
Number of Assistant Superintendents in, should be gradually reduced, and number in lower services be increased, *Ewing* 70095, 70096, 70101-3, 70104, 70106
Number excessive, and reduction advocated, *Aulad Hossein*, 70127; *Biggie*, 70134 (20), *Greiff*, 70200 (16).
Posts held by officers, *Burrard* 70168
Reasons for employment of military officers, *Burrard* ... 70158, 70159, 70165, 70170, 70190
Recruitment (*see that title*).
Should be thrown open to Provincial Service, part be recruited in England and part in India from selected Provincial Service officers, *Greiff* 70200 (14) (15)
Strength and cost excessive, *Greiff* ... 70200 (14)
(*see also* Leave, Pay, *etc.*)

Indian Army Officers:
no Claim to appointment in superior service, *Greiff* 70200 (17)
might be given Facilities for undergoing military tests for promotion and be more often sent on field service as survey officers, *Gwyn* 70079, 70084
Know of all departments for which eligible, but Commanding Officer objects to men applying, *Burrard* 70176
not Part of war reserve, *Burrard* 70178
Superiority to Provincial officers, *Burrard*... 70165

Indians:
Comparison with Imperial officers, *Lenox-Conyngham* 70073
Introduction and extension of, in department, not objected to, if selected from right materials, *Biggie* 70134 (21) (22)
Limitations on employment in Imperial Service, question does not arise, as service a military one, *Lenox-Conyngham* 70049
no Limitations on employment of, in Provincial Service, *Lenox-Conyngham* 70049
Provincial Service becoming more popular among educated classes, *Aulad Hossein* 70116

Recruitment to Imperial Service, Direct:
would be Possible if standard of training at Dehra Dun raised, *Aulad Hossein* ... 70128
with Proper training, including time in England, preferred to promotion, but neither scheme advocated, *Lenox-Conyngham* ... 70063

Recruitment to Provincial Service:
Applications, more from, generally than from Anglo-Indians, *Aulad Hossein* 70126
Efficiency of department not injured by, *Burrard* 70164
History of, *Aulad Hossein* 70116
Larger proportion of posts should be allotted, *Aulad Hossein* 70116, 70118
Open competition would be preferred, and not reservation of definite proportion of posts, *Aulad Hossein* 70118

J

Junior Branch:
List of officers of, on military duty and political missions, *Greiff* ... ... p. 385-6
List of survey officers recruited from, *Greiff* 70200 (15)

K

Kaiyasthas (including Parbhus), civil appointments on Rs. 200 a month and over, held by, 1st April, 1913 ... ... p. 396

Kshatryas, civil appointments on Rs. 200 a month and over, held by, 1st April, 1913 ... ... p. 396

L

Leave, Imperial Service:
Amount adequate, but many restrictions and rules complicated, *Lenox-Conyngham* ... 70047
Ledger account suggested, *Lenox-Conyngham* 70047
Privilege, accumulation for more than three months, recommendation *re*, *Lenox-Conyngham* 70061
Rules sufficiently liberal, but too complicated, *Burrard* 70162

Leave, Imperial Service—*continued.*
Study:
no Advantage seen, with certain exceptions, *Lenox-Conyngham* 70061
Training obtainable in England and India not very different, *Lenox-Conyngham* ... 70070
Suggestions, *Gwyn* 70080

Leave, Provincial Service:
Amount liberal, *Ewing* 70093
Conditions, *Burrard* 70162
Furlough:
Recommendations *re* amount and periods, *Aulad Hossein* 70114, 70123
Three years', should be allowed during service, *Burrard* 70162
Improvement of rules, need for, *Greiff* 70200 (19)
Long furlough on full pay to all officers, claim to, not agreed with, *Burrard* 70162
Officers appointed by Secretary of State to appointments as Managers and Assistant Managers in technical offices under Indian Leave Rules, and hardship, *Lenox-Conyngham* 70047
Medical, recommendation, *Burrard* 70162
Privilege:
Accumulation up to six months should be allowed, *Aulad Hossein*, 70114; *Burrard*, 70162; *Greiff*, 70200 (19).
Restriction of period for, and hardship, *Aulad Hossein* 70114
Restriction of six months of duty between periods, relaxation in certain cases advocated, *Aulad Hossein* 70144
Recommendations, *Greiff* 70200 (19)
Rules:
Difference from European rules, reason, but hardship in some cases admitted, *Burrard* 70162
might be Simplified, *Lenox-Conyngham* ... 70047
Small amount taken, *Greiff* 70200 (19)
Study, scheme, *Ewing* 70090, 70093, 70098

Lenox-Conyngham, Lieutenant-Colonel G. P., R.E., evidence of 70044-70076

M

Military Officers:
Detailing of, for tour of duty in Survey Department on military pay plus survey allowance, Military and Survey Departments halving cost, Colonel Farquharson's suggestion approved, *Biggie* 70139, 70134 (20)
Scheme, and advantages of, *Greiff* ... 70200 (16)
(*see also* Imperial Service.)

Muhammadans, civil appointments on Rs. 200 a month and over, held by, 1st April, 1913 p. 396

N

Non-commissioned Officers, scheme for recruitment of (*see under* Upper Subordinate Service).

O

Organisation:
Administrative head should be a civilian, *Greiff* 70200 (20), 70209
Civil Department, no reasons against, and advocated, *Greiff* 70200 (17), 70203
had always been a Civil Department, not military, *Biggie* 70136, 70141
Classes of officers and organisation, *Lenox-Conyngham* 70044, 70052
proposed Composition, *Greiff*... ... 70200 (16)
Demilitarising of, advocated, and placing chief control in hands of civilian, *Biggie* 70134 (19), 70135
Division into Civil and Military, proposal and scheme, *Greiff* 70200 (20)
Number of officers in, required in event of mobilisation, question of, *Burrard* ... 70177
Old Senior Division, numbers of Junior Division men in, *Biggie* 70134 (5)
proposed Organisation not agreed with, *Biggie* 70139
Possible time present survey will take, but contraction of staff would not follow after, *Lenox-Conyngham* 70064
Reintroduction of old system of division into "Senior and Junior Services" favoured, and scheme, *Aulad Hossein*. 700119-21; *Greiff*, 70200 (16).

Organisation—*continued.*
Reorganisation of 1913, effects, *Burrard* p. 394–5
Reorganisations, and hardships to Provincial Service entailed by, *Biggie*, 70134; *Greiff*, 70200, 70208.
Strength and cost, 1887–1913, and increase, *Greiff* 70200 (16), p. 382, p. 383
War reserve from, no question of, heard, *Biggie* 70146

P

Parsis, civil appointments on Rs. 200 a month and over, held by, 1st April, 1913 ... ... p. 396

Parties:
Acting appointments to officer of junior division, recommendation, *Greiff* 70200 (16)
Number and charge, *Biggie* 70148
Number, and number held by Provincial and Imperial officers, *Aulad Hossein* ... 70118
Period required before Imperial officer qualified to take charge of, *Burrard* 70169
SIZE:
Increase in, *Burrard* 70182
should be Increased, *Ewing* 70104

Pay:
Junior Service, scheme, *Greiff* ... 70200 (16)
Single cadre in which civilian officers on same standing as military would be paid at rates equal to three-quarters those paid to military officers, advocated, *Aulad Hossein* ... 70125

Pay, Imperial Service:
Adjustment of time-scale so as to include charge allowance desired, *Lenox-Conyngham* ... 70059
CHARGE ALLOWANCES:
Abolition:
Advocated, *Greiff*... ... ... 70200 (16)
Advocated in case of officers drawing Rs. 1,000 and over per month, *Biggie* 70134 (15) (19) (20)
not Necessary, *Burrard*... 70174
Varying of amount according to importance of charge, doubt as to possibility, *Burrard* 70189
Comparison with Public Works, and justification, *Burrard* ... ... p. 395–6
in Excess of that of similar officers in Public Works and Military Works Departments, and considered too high, *Biggie* 70134 (14) (15), 70144
Particulars *re*, and allowances, and rates considered excessive, *Greiff* 70200 (16)
proposed Rates, *Greiff* 70200 (16)
of Royal Engineers higher than in Public Works Department, and method of fixing, *Burrard* 70179
Service considered well paid by Indian Army officers, *Gwyn* 70085

Pay, Provincial Service:
Comparison with Public Works and Forest Departments, probationary period of survey should be set off against college periods, in favour of former, *Burrard* 70161
Complaint *re* difference from pay in Imperial Service, *Lenox-Conyngham*, 70060; *Biggie*, 70138
Effects of 1913 reorganisation on, *Burrard* p. 394
Inadequate, with exception of probationers, and proposed scale, *Ewing* 70092
Initial, comparison with other services, and hardship, *Biggie* 70134 (15)
Pay and prospects should be somewhat similar to those in Public Works Department, *Greiff* 70204
Proportion to that in Imperial Service, and grievance, *Biggie* ... 70134 (10), 70138, 70144
proposed Scale, *Ewing* 70098, 70107–8
TIME-SCALE:
Concession welcomed, *Aulad Hossein* ... 70113
Grievances, *Biggie*, 70134 (8) (9); *Greiff*, 70200 (20), 70208.
One for Deputy Superintendents and one for Assistants, with promotion by selection favoured, *Burrard* 70174
System, comparison with Imperial Service, and hardship, *Biggie* 70134 (9)
Triennial increments, conversion into annual, requested, *Aulad Hossein* 70113, 70122

Pay, Provincial Service—*continued.*
TRAVELLING ALLOWANCE:
Claim to treatment of certain officers as first-class officers for, *Aulad Hossein* ... 70112, 70131
Comparison with other services, and grievances, *Biggie* 70134 (7) (16)
Effects of 1913 reorganisation on, *Burrard* p. 395
Grievance, and claim to first-class rates, *Greiff* 70200 (14) (18)
TWO-THIRDS SCALE:
not Applicable, *Lenox-Conyngham* 70060
Principle departed from, *Ewing* 70092

Pensions, Imperial Service:
Conditions governed by military regulations, *Burrard* 70163
ordinary Indian Army pension of £700 after 32 years' service should be augmented by £100 for Survey of India officers, *Gwyn* ... 70081, 70085
Maximum, increase advocated, *Aulad Hossein* 70115, 70124
Officers should be allowed choice between military pension allowable and that which "half average salary" rule would give, *Gwyn* 70081

Pensions, Provincial Service:
Amount should be calculated on basis of average emoluments for last year's service, *Aulad Hossein* 70115
Effect on, of increase of salaries, *Burrard*... p. 395
Exemption from income tax advocated, *Aulad Hossein* 70115
Maximum liberal, but salaries and numbers of appointments in higher grades should be raised to ensure officers receiving after 30 years' service, *Ewing* 70094, 70100

Probation and Training, Imperial Service:
Chatham and Sandhurst the best training schools, but special survey training required for Indian conditions necessary, *Burrard* ... 70195
in Department necessary as well as at Chatham, *Greiff* 70200 (17)
IN ENGLAND:
for Civilians, difficulty of obtaining, *Lenox-Conyngham* 70063
would be Preferred to training by department, *Lenox-Conyngham* 70075
in Indian university would not be substitute for training at Woolwich and Chatham, but similar training could be supplied by department if man had sufficient educational foundation, *Lenox-Conyngham* 70074
of Indian Army officers, three years suggested, *Lenox-Conyngham* 70054, 70058
after Joining department same for both Imperial and Provincial branches, *Biggie* 70142
Royal Engineers, period required, *Lenox-Conyngham* 70058
at Sandhurst as well as at Chatham and Woolwich, *Lenox-Conyngham* 70076
Scheme, *Gwyn* 70078
System, and no change necessary, *Lenox-Conyngham*, 70045; *Burrard*, 70160.
Three years' probation not too long, *Biggie* 70149
Three years in Survey before taking charge of party advocated, *Ewing* 70108

Probation and Training, Provincial Service:
Complaint that training not sufficiently varied during first year, reply to, *Lenox-Conyngham* 70058
AT DEHRA DUN:
Arrangement could be made to give higher education, *Aulad Hossein* 70128
Satisfactory, *Burrard* 70160
must Depend on work for which service required, and proposed lengthy and varied courses with survey parties not approved, *Burrard* 70160, 70187
Establishment in India of institution on same lines as in England would not be justified, but desired training could be provided at existing colleges, *Aulad Hossein* 70132

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

ON THE

PUBLIC SERVICES IN INDIA

RELATING TO THE

MADRAS SURVEY DEPARTMENT,

At Madras, Monday, 26th January, 1914.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

SIR VALENTINE CHIROL.
WALTER CULLEY MADGE, Esq., C.I.E.
FRANK GEORGE SLY, Esq., C.S.I.
HERBERT ALBERT LAURENS FISHER, Esq.

And the following Assistant Commissioner:—

L. E. BUCKLEY, Esq., I.C.S., Commissioner of Revenue Settlement, Madras.

R. R. SCOTT, Esq. (*Joint Secretary*).

D. G. HATCHELL, Esq., Director of Revenue Survey, Madras.

Written Statement relating to the Madras Survey Department.*

PART I.—GENERAL OPINIONS OF EUROPEAN OFFICERS.

70744. **(I) Method of Recruitment.**—The present method of recruitment† is to appoint an European and an Indian Officer in alternate vacancies. It has been recognised by Government‡ that a proportion of Europeans is indispensable for the Department, and the system of recruiting such Europeans in India is not, I submit, satisfactory in the present day. Formerly, it was the custom of young men with an English public school training and Indian traditions to come to this country to obtain appointments in the Public Works, Forests, Police and Survey Departments. The Department of Public Works, Forests and Police now recruit their European staff in England and no one with the qualifications required for the Survey Department dreams of coming to Madras from England on the chance of getting a Government appointment.

There has been for some time a vacancy on the European cadre unfilled for want of a suitable man. An officer was appointed on probation some time back, but was unable to pass the examinations required and has been discharged. Appointments of Europeans should be made in England from public school boys who had undergone training in survey at the Ordnance Survey Office, Southampton; physique and eyesight should be good and the age limits 19—23. The conditions of service in the Department are exacting and an officer must be of active habits and fond of an open-air life.

It is casting no slur on educated Indians to say that these qualities are uncommon among them, and generally speaking an Officer in charge of a Survey Party should be a European. It would, however, be unwise to close the gazetted grades of the Department to Indians by whom the subordinate ranks must be filled, and such a course would certainly be detrimental to obtaining educated Indians to fill the upper subordinate grades. The direct appointment of Indians to the gazetted grades is considered inadvisable, as the possession of the qualities referred to above must first be proved and they cannot be proved except by service in field in the upper subordinate grades. The cadre proposed for the Department is seventeen officers, exclusive of the Director, and five of these appointments should be reserved for Indians who had proved their fitness by service.

70745. **(II) System of Training and Probation.**—The present system of training and probation of officers appointed direct to the gazetted grades is given in Annexure V. Should

* This statement was submitted by Mr. W. A. Hasted, Acting Director of Survey.

† Government Order No. 315, dated 22nd March, 1887, paragraph 8, sub-paragraph 2—Annexure I.

‡ Resolution of the Government of India, dated Simla, 31st May, 1897, No. 2422-Ex., paragraph 8 (2)—Annexure II.

Paragraph 84 of Mr. Carr's report, pre-penultimate sentence—Annexure III.

appointments be made in England, the period of survey training might be limited to six months; the settlement period of training also might be reduced to six months for both Europeans and Indians.

70746. **(III) Conditions of Service.**—Work in the Survey Department, particularly as constituted in this Presidency, is arduous. Not only has the Madras Survey Officer to stand exposure to sun and rain, from year's end to year's end, but he has to control a large staff of men, many of whom have little education and are borne mostly on the temporary establishment. With such a staff he has to achieve the year's stiff programme of work successfully and the drain on his energy is thus heavy. I would therefore recommend that, in compensation of this strain, his burden of service be lightened by making him eligible for voluntary retirement on completion of 25 years' service instead of 30 years' service as required by the present rules. Three European officers, out of a staff of 12, of between 40 and 50 years of age have died during the last few years, and an Indian officer who retired in 1909 survived only three years to enjoy his pension.

70747. **(IV) Conditions of Salary.**—The present scale of pay in the Department is much less than that in force thirty years ago, though expenses of living have increased considerably and salaries in the kindred scientific departments of Public Works and Forests have been raised. There are six appointments on Rs. 300 out of a total of 15 appointments and 10 years may elapse between the appointment of an officer and his first promotion. The reduction in the scale of pay referred to above took place between 1898 and 1905 and was due to the belief, now accepted as erroneous, that the work of the department was practically at an end.

The Revenue surveys of this Presidency are unequalled in India and probably in the world. Their excellence from a professional standard has been recognised by the Surveyor-General of India (Annexure IV.), and their minuteness and accuracy are undisputed. Such surveys are necessitated by the revenue system of Madras and are, of course, costly. It is false economy to employ any but the best material to carry them out, and the department should be placed on a scale of pay similar to that in the Forests and Public Works departments (the other scientific departments of the Presidency) so far as the executive grades of the European appointments are concerned, *i.e.*, incremental from Rs. 380 (after confirmation) to Rs. 700 by annual increments of Rs. 40 and from Rs. 700—Rs. 1,250 by annual increments of Rs. 50. The scale of pay for Indian officers should be Rs. 300—900 by annual increments of Rs. 40. The incremental period for Indians to attain the maximum executive salary is suggested as 15 against 20 years in the European cadre, as it is proposed that Indian officers should be appointed by promotion of upper subordinates—*vide* reply to head I. The difference in the scales of pay suggested is considered to represent the difference between the expenses of European and Indian officers; for the same reason a sterling pension has been proposed for the former.

70748. **(V) Conditions of Leave.**—The first seven officers now in the Department are granted leave under the European Service Leave rules and the other European officers will obtain these rules on reaching the grade of Assistant Director, second class. The European Service Leave rules may be extended to all European officers from the date of their entertainment. In the case of Indian officers, service for eligibility for first furlough may be reduced from ten to eight years and the intervals between subsequent furloughs from eight to five years; otherwise the Indian Service Leave rules are considered satisfactory. The minimum absentee allowance of an officer in Europe, £200, is generally regarded as too low, and it may be fixed at £350 for an officer of under ten years' service and at £500 for an officer of over ten years' service, the maximum being £800. It is impossible now for a married officer to live at home on his furlough pay, and he generally returns to India in debt, conditions which prevent his holiday being as beneficial as it should have been. The furlough pay of officers in India may also for the same reason be raised to two-thirds the average salary drawn in the three years of service preceding the furlough. It is also suggested that privilege leave in both European and Indian cadres be allowed to accumulate up to six months and that furlough should be commutable into privilege leave in the ratio of 2:1 up to a maximum absence at one time of nine months on full pay.

70749. **(VI) Conditions of Pension.**—Consequent on the proposals under (III) Conditions of service, it is recommended that a Survey officer be rendered eligible for an invalid pension of half average emoluments after twenty years of completed service and to a retiring pension of the same on completion of 25 years' service. The maximum pension admissible for ordinary service should be £500 a year and Rs. 5,000 for Europeans and Indians, respectively, an additional pension of Rs. 100 being given to Indians for each year's service after 25. The pension to an officer who had served for three years as Director, either acting, sub *pro-tem.*, or substantive, should be £600 a year to Europeans and Rs. 6,000 to Indians. In column 1 of article 408, Civil Service Regulations, the figures 10, 15, 20, 25 and 30 years may be substituted for 15, 20, 25, 30 and 35 years' service.

70750. **(VII) Limitation of employment of non-Europeans, etc.**—See reply to head I. It is there suggested that the department be divided into two services, European and Indian.

70751. **(VIII) Relations of the Service with the Indian Civil Service and other Services.**—The junior officers of the department have now to serve for a time as Land Records Superintendents. The work to be done is not professional, and it is desirable that the early and impressionable years of a survey officer should be spent in fitting him to control a survey party. The posts of Land Records Superintendents could be filled by Deputy Collectors with a six months' training in survey and the officers of the two departments should be separate.

70752. **(IX) Other points.**—The officers of the Madras Survey have to provide their own tents, though other officers are supplied with them, and it is suggested that the recommendation of the Board of Revenue (Board's Reference No. 2415, dated 6th October, 1910) that tentage should be allowed at the rate of Rs. 50 per mensem to Director and at Rs. 35 to other officers may be now given effect to. The recommendation was not approved by Government.

The Presidency allowance granted to the officer in charge of the Central office is Rs. 60 only, but the difference in the necessary expenses of life between Madras and mofussil is at least Rs. 250. The allowance may be raised to Rs. 200, the same as given to the Assistant Inspector-General of Police.

The question of the re-organisation of the survey gazetted staff is now engaging the attention of Government, as also that of the Land Records Department. The continuance of the latter appears neither necessary nor economical. Periodical resurveys or revision surveys will, in the long run, prove more economical and effectual. The Revenue department ought not to feel any appreciable difficulty in administration in the interval between one settlement and the next. The karnam's opportunities for oppressing the ryots are growing fewer, and with the advance in primary education they are bound to grow fewer still. The Land Records staff must, therefore, disappear, and at once. In that event there should be six survey parties on a permanent footing. At two officers for each party, and three for the Central Survey office, 16 officers, including the Director, will be needed for the department. Two more officers will be required as reserve, to take the place of officers on leave, so that the department may be self-contained.

PART II.—OPINIONS OF INDIAN OFFICERS.

70753. They agree in all particulars with those of the European officers of the department with the exception of the following.

70754. **(I) Methods of Recruitment.**—The proportion of European to Indian officers in the department should be equal, *i.e.*, 50 per cent. in each case. In the case of Indian officers, appointments should be made partly by recruitment and partly by promotion from the upper subordinate grade. (One of the Indian officers consulted is in favour of promotion only.)

Since a survey officer, European or Indian, has similar duties to perform, there should be no differentiation in the matter of selection of an officer for the charge of a party. It should go by seniority, and, as in the incremental system of pay proposed under head IV. (conditions of salary), increments can be stopped for inefficiency, there will be no chance of an officer not up to the mark holding charge of a party.

70755. **(IV) Conditions of Salary.**—There should be no distinction in the salaries of officers, European or Indian; such a distinction has hitherto not been made in the Madras Survey Department. The minimum salary should be Rs. 380.

70756. **(VI) Conditions of Pension.**—No distinction seems necessary in the case of officers other than the Director. The limit of maximum pension may in their case be fixed at Rs. 6,000.

70757. **(VII) Limitation of employment of non-Europeans.**—Please see note under head I.

* * * * *

ANNEXURE I.

Extract from paragraph 8 *of G.O. No.* 315, *dated* 22*nd March*, 1887, *communicated in Board's Proceedings* (*Settlement*) *No.* 82, *dated* 20*th May*, 1887.

* * * * *

2. His Excellency the Governor in Council is of opinion that, unless some unforeseen contingency occurs, such as the death or retirement of more than the usual annual proportion of officers, it will not be necessary to make further appointments to the Survey Department; in the event of this contingency arising, he will be prepared to appoint a native of India to every alternate vacancy.

ANNEXURE II.

Extract from the Resolution of the Government of India, dated 31*st May*, 1897, *No.* 2422-*Ex.*, *printed in G.O. No.* 491, *Financial, dated* 24*th June*, 1897.

* * * * *

B.—Services and departments in which a proportion of Europeans is held by the Government of India to be indispensable.

8. The only services and departments which have as yet been admitted within this category are those referred to in the orders of 1879 regarding appointment and promotion of Europeans. They are—

(1) The Account Departments, Civil, Public Works and Military and the Forest Department, so far as these are filled by appointment, after examination; and

(2) the Education Department in the case of persons appointed by the Secretary of State.

The following departments—Opium, Salt, Customs, Survey, Mint, Public Works and Police.

These orders do not refer to appointments of which the pay is less than Rs. 200.

ANNEXURE III.

Extract from paragraph 84 *of report of Mr. R. C. C. Carr, Officer on Special Duty, dated* 12*th February*, 1903, *to the Secretary to Government, Revenue Department, in connection with the creation of the Land Records Department and the re-organisation of the Survey Department.*

* * * * *

The European element is indispensable, and will always be required for the post of Superindendent.

ANNEXURE IV.

Extract letter from the Superintendent, Southern Circle, Survey of India, Bangalore, to the Director of Survey, Madras, No. 979, *dated the* 7*th July*, 1911.

* * * * *

The results of this year's survey of the former sheet go to show that the reductions are accurate and suitable for utilisation as a basis for our one inch surveys.

* * * * *

ANNEXURE V.

Training of Probationary Assistant Directors of Survey.

1. Before appointment as Probationary Assistant Directors, candidates will be required to pass an examination in mathematics. The papers will be on the following subjects:—

Arithmetic.
Algebra—Quadratics, including the Binomial theorem.
Euclid—First four books.
Mensuration.
Trigonometry—Solution of plane triangles.

2. If successful, the probationer will be attached to a Survey Party for one month, to a Settlement Party for 12 months, to a Survey Party again for six months, and to the Central Survey Office for three months.

3. When fully qualified to perform all the duties of an Assistant Director of Survey, he will, if he has passed satisfactorily the examination in Survey and Settlement and the prescribed examination in a native language, be recommended for confirmation on Rs. 300.

COURSE OF INSTRUCTION.

(I) *Survey Party—One month.*

4. Elements of survey and use of the following instruments:—Chain, offset pole, cross staff, prismatic compass, plane table, protractor, plotting and offset scales, area square and computing scale.

(II) *Settlement Party—Twelve months.*

After the probationer has undergone the course of one month's training as prescribed above, he will be attached to a Settlement Party for 12 months, to acquaint himself with the general principles of Land Revenue Administration and Settlement. He should study the following subjects in which he will be examined at the end of the Settlement course:—

(1) Madras Administration Report for 1901-2—Chapter 1, 122—214 inclusive.
(2) Standing Orders of the Board of Revenue—Chapters I, I-A, IV, VII, VIII, XIII and XIX, Orders 201, 202 and 202A.
(3) Revenue Acts and Regulations—
Madras Regulations XXV and XXVI of 1802.
Madras, Act II. of 1864.
Do. Act. III. of 1869.
Do. Act VIII. of 1869.
Do Act I. of 1876.
Do. Act V. of 1882.
Do. Act II. of 1894.
Do. Act III. of 1895.
Do. Act IV. of 1897.
Do. Act I of 1908.
(4) Manuals of Village and Taluk Accounts.
(5) Settlement Manual.

(III) *A Survey Party—Six months.*

(1) The survey and demarcation of a 300-acre block—all the records for the block should be prepared by the probationers themselves—one and a half months.

(2) Instruction in the use and adjustments of the theodolite and in observation and computation of azimuths. At least three observations should be taken, and the correct bearings of three lines computed. Traverse computation and plotting by Gales' system—one and a half months.

(3) The traverse survey of 40 linear miles of village or khandam boundaries—one month.

(4) The survey with theodolite of four square miles by triangulation and the topographical survey of this area. The topographical survey should show the limits of wet and dry cultivation, village boundaries and topographical details, but not the boundaries of fields. The connection of the two great trigonometrical stations in the above area and the recording and computation of results in the forms prescribed—one month.

(5) Charge of a Sub-Assistant's section performing all the duties required of a Sub-Assistant—one month.

(IV) *Central Survey Office—Three months.*

(1) The probationer should work the means and synopses of the observations for triangulation referred to in section 4 above, compute the sides of triangles and the spherical excess of the angles and find out the latitudes and longitudes and azimuths of the stations.

(2) He should prepare a traverse chart on the 4-inch scale entering in it the observed angles and measured distances in black ink and the computed angles and distances in red ink. He should then prepare the following records:—

(i) Main and minor traverse and all other computation records for one great trigonometrical triangle.

(ii) Pantagraph reductions to the 1-inch scale of the 16-inch maps of two or three villages, total area not less than 10 square miles.

(3) He should be instructed in the following branches of work:—

(*a*) Final examination of village maps.

(*b*) Projection of taluk and district maps.

(*c*) Stellar observations for time, azimuth and latitude.

(*d*) Construction and adjustment of the theodolite and other surveying instruments.

5. *Examination in Survey.*—The probationer should study the following text-books in which a departmental examination will be held on completion of his course of instruction in survey:—

(1) Karnam's Survey Manual.

(2) Madras Survey Manual of Departmental Rules.

(3) Rurki Survey Manual, Chapters 1 to X, XIV and XV.

(4) Clancey's Aid to Land Surveying.

(5) Text-book of topographical and geographical surveying by Major C. F. Close, C.M.G.

(6) Chamber's Mathematical Tables, Introduction, explanation and use of the following tables:—

(i) Common logarithms.

(ii) Logarithmic sines, tangents and secants.

(iii) Natural sines, cosines, chords, etc.

(iv) Natural tangents and secants.

(7) The auxiliary tables of the Survey of India, introduction, explanation and use of the tables X, XI, XII, XVI, and XVII.

6. *Examination in Vernacular.*—The examination to be passed in a native language is that prescribed in G.O. No. 508, Public, dated 24th June, 1891. It consists of:—

(1) Reading fairly and translating with accuracy an original letter or report of moderate length and difficulty in the language of the district.

(2) Dictating an order.

(3) Rendering into English a vernacular report read out.

(4) Conversing with the examiner or with natives of India on subjects likely to occur in the performance of professional duty, in the transaction of ordinary business or in the course of everyday life. If the candidate proves his ability to comprehend readily all that is said to him and to make himself fairly intelligible, more should not be required of him.

Supplementary Written Statement relating to the Madras Survey Department.*

70758. **(I) Method of Recruitment.**—I would confine recruitment of the European cadre to graduates of the English, Scotch or Irish Universities who have taken an honours degree in Mathematics. It is from this class that the Forest Department and to a certain extent the superior Revenue Establishment of Indian State Railways, and, if I am not mistaken, the Egyptian Survey Department are now recruited, and I believe the supply is greatly in excess of the demand. The choice of candidates I would leave to a Selection Committee appointed by the Secretary of State in Council. The standard of physical fitness should be as high as that of the Forest Department. I would confine recruitment of the appointments reserved for Indians to Upper Subordinates (Sub-Assistants) of the Department. There is no gainsaying the fact that an out-of-door life is not congenial to the average Indian graduate, and that the Indian is sooner rendered unfit for hard work in the field than the European through his ageing more rapidly. The Indian is in his element in an office and generally renders excellent service. A degree in Engineering would be wasted on a Survey Officer, and no degree is any criterion of an Indian's value as a Survey Officer. This can be gauged only by his conduct of his duties in the Upper Subordinate grades of the Department.

70759. **(II) System of Training and Probation.**—I am in full agreement with Mr. Hasted in considering that the present system of training is faulty. Ten months' training in Survey is insufficient to make the average Probationer an efficient Assistant to the Officer in charge of a Survey Party, but owing to the exigencies of the Service he has more than once been required to hold charge of a Survey Party! If in future, recruitment for the European cadre is confined to graduates, I would require the selected candidates to undergo a course of Survey at the Ordnance Survey Office, Southampton. I doubt they would be able to satisfy the Surveyor-General of the Ordnance Survey as to their general knowledge of Survey in less than a year. As a rule, it takes a student at the Royal Geographical Society's headquarters longer than this to obtain the Society's diploma, but few of them, I believe, have had the advantage of a Varsity education.

70760. **(III) Conditions of Service.**—There is no exaggeration whatever in Mr. Hasted's description of the very bad conditions now prevailing in the Department. They could hardly be worse! The impossibility of the task imposed on Survey Officers is not only destructive of their peace of mind, but of economy also. This I have repeatedly urged since I took charge of my office 13 years ago, but to no effect. It is generally recognised that to get the best out of the low-paid Indian employee, Civil or Military, adequate European supervision is a *sine qua non*. There is a greater efficiency, greater desire to please, and a general spirit of *esprit de corps* amongst the rank and file when they know their European Officers and realise that they are known to them. In the Survey Department, as at present constituted, it is impossible for the European Officer in charge of a Survey Party, comprising 200 to 300 low-paid subordinates in office and field, unaided by an assistant, to know his men as he should and to exercise the supervision they require. He has in consequence to leave much undone that should be done and to rely on the reports of his upper subordinates, some of whom are not free from bias, and create disaffection. The system of Survey adopted in this Presidency and necessitated by its Revenue Administration is much more complicated than that of any other Province. A high standard of accuracy is insisted upon, but at the

* This statement was put in by Mr. Hatchell subsequent to his oral examination. In forwarding it he wrote that he agreed in the main with the preceding written statement, to which this is supplementary.

same time exception is taken to the cost of the survey. This is dependent to some extent on the individual efforts of the surveyors. While idlers and inaccurate workers are put under stoppages of pay, the progress of the survey is delayed and its rateable cost increased as the supervisory charges are irreducible. The only way in my opinion to effect these desiderata is to give the Officer in charge of each Party an Assistant.

70761. **(IV) Conditions of Salary.**—The conditions of salary ruling in the Department are clearly indicated in the accompanying tabulated statement* in which the rate of promotion at present obtaining in the Survey and three other Departments is compared. The six Survey Officers, whose service in each grade is averaged are, excepting myself, all that remain of those who joined the Department prior to the changes effected in the cadre in 1891 and 1905. I have excluded myself, as my fortune has been so good that it would be destructive of the presentation of the real prevailing conditions under which the other six officers are labouring to include in the averages the figures that pertain to me. It has not been possible to calculate what additional amounts officers have received on account of acting or sub *pro tem.* promotions, but this I believe will not affect to any appreciable extent the relative differences in the average salary of an officer of each of the four Services. The figures from which were calculated the average service of a Survey and a Police Officer on promotion to each grade, as also of officers of the other two Services in the grades on Rs. 1,500 and upwards, were obtained from the Madras Quarterly Civil List corrected up to 1st October, 1913, and from the classified list of the State Railway Establishment corrected up to 31st December, 1912. It will be seen that though Police Officers have fared badly as compared with the Officers of the Forest, and Traffic Department of State Railways, the lot of the Survey Officers has been infinitely worse, *e.g.*, one of the six officers with upwards of 21 years' service is still on Rs. 550 only, two with upwards of 26 and 20 years' service on Rs. 750, and two with upwards of 29 and 28 years' service on Rs. 900, and one only with close on 30 years' service on Rs. 1,100. In the event of his seniors remaining in service, until they reach the age of 55 years, Mr. Lushington cannot get Rs. 900 until 17th November, 1917, the date on which Mr. MacHutchin must retire, and even then he will not be able, as he will reach the age of 55 on 14th July, 1920, to put in three years' service in that grade to entitle him to full pension in spite of the 33 years' service—all but three weeks—which he will then have to his credit. It is clear, therefore, that the graded system of pay has worked much hardship in the Survey Department. If any further evidence of this is required, it is to be found in the last column of the statement which shows that the average annual emolument of a Survey Officer during the first 20 years of his service was £325 per annum, as against an average of £589 in the other three Services, or 45 per cent. less. Further calculations on the same basis show that the average emoluments in 20 years of the same six Survey Officers were less by Rs. 35,417 or £2,361 than that received by all the nine retired, or deceased, Civilian Officers, who served in the Department since its creation in 1858, with the exception of the late Mr. G. P. Greene, who is excluded for the reason that he, like me, was exceptionally fortunate in rising to the head of the Department some years before he had completed 20 years' service. The necessity and equity of an incremental system of pay has been recognised by the Secretary of State and adopted in all the uncovenanted Services except the Survey and the Police, which the tabulation statement clearly shows are in urgent need of it too.

The incremental scale of pay recommended by Mr. Hasted is much the same as that adopted for the Forest and Public Works Departments and is calculated to give the Survey Officer a salary of Rs. 1,250 per mensem when he reaches his twentieth year of service. Thereafter his chance of further promotion is less than that of the Forest or Public Works Departments Officer, who have five and nine appointments rising to Rs. 1,900 and 2,750 respectively to look forward to, as against his one appointment on Rs. 1,800, since reduced to Rs. 1,400 for future incumbents. This reduction of salary is quite unjustifiable as the difference of Rs. 300 between the pay of the Deputy Director 1st class and the future maximum pay of the Director is not only not commensurate with the heavier work and responsibilities of the latter officer, but does not cover the additional cost of residence at the Presidency town. Nothing less favourable than the incremental scale recommended by Mr. Hasted can in justice be granted to the six Survey Officers whose lot as compared with that of their contemporaries in the Police who were recruited in the same way and from the same class, or with that of officers of the other two Services or even with past officers of their own Service, has been so hard. It is the only fair scale for European Officers for whom conditions of life in India are gradually getting harder, and I feel sure it will attract men of the best 'Varsity education. It is possible that in their ignorance of conditions of life in India, they would accept a lower scale of salary, but it would be impolitic to offer it, as in the course of time it would be the cause of complaint or dissatisfaction. The scale of pay recommended by Mr. Hasted for Indian Officers is slightly higher than that now obtaining in the Public Works and Forest Departments. Though I see no reason why it should be so, I am quite averse to any less favourable scale than that now obtaining or that may hereafter be adopted in the other two Services. Though the liability of the European and Indian Survey Officer to injury to his health through frequent attacks of malaria may be less than that of his confrère in the Forest Department, he has to undergo just as much exposure to the elements and must necessarily have more office work owing to the much larger establishment he has to control and to the closer scrutiny of details which his work demands. I would, however, strongly recommend a higher rate of increment, *i.e.*, Rs. 80, as a special concession to Mr. T. A. Sundaram Ayyar in consideration of the fact that he has been acting in the gazetted grades almost continuously since 1904, and could not be confirmed for want of a permanent vacancy until 20th October, 1911, when he had reached the 48th year of his age. He has rendered exceptionally good service and it would be distinctly hard that he should suffer a large reduction in his pension as he will do, if not given the higher incremental rate of Rs. 80 from the date of his confirmation until the 30th November, 1918, when he will reach the age of 55. I quite agree with Mr. Hasted that the Land Records Superintendents should not be included in the Survey cadre. Those of them who are ex-Tahsildars and have undergone only six months' training in Survey are quite unfit to hold the appointment of an officer in the Survey Department.

70762. **(V) Conditions of Leave.**—I am in full agreement with all that Mr. Hasted has said on this subject. Sanction to accumulate privilege leave up to six months and to commute furlough into privilege leave in the ratio of 2:1 up to a maximum absence at one time of nine months on full pay would be a great boon to many a married European Officer who is debarred from taking furlough, of which he may be in urgent need, owing to his inability to maintain himself and his family in Europe on half pay. It would also be very beneficial to all grades of Indian employees who are generally precluded from taking long leave, of which they are in need, for the same reason.

70763. **(VI) Conditions of Pension.**—Under Chapter XIX, Article 474, C.S.R., a Survey Officer cannot obtain any pension at all until he has completed 30 years' service whereas officers of the Public Works, Forest, and Telegraph, are eligible not only for a proportionate pension of £350 after 20 years' service but to full pension of £437 10s. after 25 years. It is generally understood

* *Vide* page 414.

that the Commission which in 1902-03 enquired into the conditions of service in the Police were strongly of opinion that 30 years' service was much too long and even went to the extent of recommending compulsory retirement of the whole force —officers and men—after 25 years' service.

There is no need to make retirement compulsory after 25 years' service in the Survey, but it should certainly be optional as in the Public Works Department and Forest Services. Few will avail themselves of the concession but the feeling that they are not tied down to 30 years of service in India will give to their outlooks towards the future a more roseate hue. It is better for the Service that the few who elect to retire on completion of 25 years' service should not be compulsorily detained for a further five years as they are likely to feel they are working more for their pension than for Government. The invalid pension after 20 years' service should certainly be increased from one-third to one-half of the average emoluments of the last three years of service rendered. I altogether disagree with Mr. Hasted that the maximum pension for Europeans and Indians should be £500 and Rs. 5,000. It should be £600 and Rs. 6,000 in consideration of the fact that the scale of pension was fixed as long ago as 1855 when £500 was the equivalent of Rs. 5,000. The present pension of £437 10s. at the rate of 1s. 9d. per rupee is therefore £62 10s. less than it was 59 years ago! In consideration of the totally different conditions of service and the high cost of living now prevailing the equity of an addition to the pension of £100 in Europe or Rs. 1,000 in India cannot be disputed. The appointment of Director of Survey is not one of those enumerated in Article 475 of Chapter XIX of the C.S.R., and it certainly should be added. The distinction made thereby between the Director of Survey and a Deputy Inspector-General of Police and Conservator of Forests is invidious. In any case, my salary for the past eight years has been more than that of five of the eight officers of the Police and Forests now eligible for the additional pension of Rs. 1,000 a year. As pointed out *supra* under "conditions of salary" the reduction of the pay of the Director of Survey from Rs. 1,500-1,800 to Rs. 1,200-1,400 was quite uncalled for, as there has been no diminution in his duties and responsibilities, but rather an undoubted increase which is bound to continue.

Though I failed to touch on Mr. Hasted's remark in para. IV *supra*, *re* the relative expenses of European and Indian Officers, and since I have recommended a maximum pension of Rs. 6,000 for the Indian officer which the existing code method of calculating pensions on the basis of the salary drawn during the last three years of service will not allow of if the highest salary allowed to the Indian is fixed at Rs. 900, I must explain the discrepant figures. There is no doubt that the increase in the expenses of the Indian Survey Officer, through the rise in the cost of house rent and food stuffs, etc., is, as in the case of the European officer, out of all proportion to any increase of salary he has received in the past. The Indian, though his standard of living is less expensive than that of the European, is burdened with many social and family liabilities, *e.g.*, the marriage of all his daughters and the provision of a dowry for each of them, and the housing and feeding of sometimes a host of needy distant relatives, who from the European point of view have really no claim on him. In course of time the Indian no doubt will shake himself free of these encumbrances and should then be much better off on Rs. 900 per mensem than the European on Rs. 1,250. He cannot legitimately claim the same pay, at any rate, if recruited in India, as every man who leaves his native land for foreign parts expects to be well remunerated for so doing. I am of opinion that a maximum pension of Rs. 500 per mensem is none too high, though about Rs. 84 more than he is entitled to according to the present code rules for an Indian who has served for three years in the highest grade on Rs. 900 per mensem.

70764. **(VII) Limitation in the employment of non-Europeans.**—The ideal Survey Officer is one who is more in his element out of doors than at his office table. For this reason and because the average Indian ages more rapidly, I agree with Mr. Hasted that the number of Indian officers should be limited to one-third, and I would employ the majority of them in office.

70765. I quite agree with Mr. Hasted's remarks in paragraph 70751 and consider the reasonableness of his claim in paragraph 70752 indisputable.

Average service of an officer on promotion to each grade (referred to in paragraph 70761).

Department.	Rs. 300.	Rs. 400.	Rs. 425.	Rs. 450.	Rs. 500.	Rs. 550.	Rs. 700.	Rs. 750.	Rs. 800.	Rs. 900.	Rs. 1000.	Rs. 1100.	Rs. 1200.	Rs. 1250.	Rs. 1500.	Rs. 1700.	Rs. 1800.	Rs. 1900.	Rs. 2000.	Approximate average emoluments received by an officer during the first 20 years of his service calculated on substantive pay, and not excluding periods spent on furlough and medical leave.

N.B.—Those Officers of the Police, Forests and Traffic Departments who have risen from the ranks and whose service is therefore abnormal are excluded.

* Mr. Bateman, whose service to date is 21 years 2 months and 11 days, is still on Rs. 550.
† Messrs. Lushington and Gompertz, whose services to date are 26 years 5 months and 23 days and 20 years 9 months and 20 days respectively, are still on Rs. 750.
‡ Messrs. Hasted and Mullins, with services to date of 29 years 2 months and 7 days and 28 years 2 months and 16 days respectively, are still on Rs. 900.
§ Mr. MacHutchin excluded, as the grade on Rs. 300 was created after he was promoted to Rs. 425.
‖ Promotions from Rs. 380 to Rs. 1250 automatically by increments of Rs. 40 or 50 annually; thereafter by vacancies and selections. The averages therefore are not actuals, but approximate, and are shown for comparative purposes only.
¶ Two classes (comprising 8 grades from Rs. 400 to 1100) of District Officers and one class (3 grades from Rs. 1250 to 2000) of administrative Officers. Promotions from class to class is by vacancy and selection, but from grade to grade automatically every two years. Royal Engineer Officers are excluded.

Mr. D. G. Hatchell called and examined.

70766. (*Chairman.*) The work of the Madras Survey Department was not topographical, but purely cadastral.

70767. The 15 gazetted officers in the Department had been recruited in India, but all the European officers had had an English school education.

70768. The present and future requirements of the Service would depend on the work the Government required it to do. At present it was engaged principally on revisional survey work. The surveys of a few estates also were in progress.

70769. He did not contemplate that at an early date the staff would be able to be reduced to the number suggested by the Government of India and the Madras Government in 1905. There was 20 years' work still to be done, if account was taken of the survey of the zamindari tracts. He agreed with the European officers' statement that a Land Records Department was neither necessary nor economical, and that six survey parties should be maintained on a permanent footing. It would be probably found much cheaper to have a resurvey or revision survey every 30 years than to employ a maintenance staff during that period. If it was decided that the Presidency should be resurveyed every 30 years, the survey parties would have to be employed permanently. In England the Ordnance survey had found it necessary to resurvey each county every 15 years; and in the Madras Presidency resettlements were made every 30 years.

70770. The present method of recruitment was to appoint a European officer and an Indian officer in alternate vacancies. Since the issue in 1908 of a Government order that there was no longer any reason for the continuance of the rule, one European, one Anglo-Indian and two Indians had been recruited to the Service, so that hitherto the rule had still been observed in practice.

70771. He differed from the proposal put forward in the written statement that, for the future, European officers should be recruited in England after a year in the Ordnance Survey. He was of the opinion that appointments should be made from amongst graduates of the English Universities who had taken honours, especially in mathematics. That was a much better scheme than an examination scheme. Under his system officers would come out to India about 23 or 24. The present age of recruitment was under 24, and this was satisfactory.

70772. Assuming that the work became more and more connected with the maintenance of land records, and less and less with surveying, he would still say that it was necessary to recruit from England. If Europeans were to be recruited at all, they should be recruited from England. For revenue survey work suitable European officers could not be obtained in India.

70773. In the Bengal Revenue Survey all the officers were of the Indian Army; he did not think there were any uncovenanted civilians. He was not aware that there were a good many provincial survey officers doing survey work in India and holding major charges.

70774. He objected to seconding provincial officers in the Survey of India because the system in Madras was absolutely different from that adopted elsewhere in India. In the Survey of India they had a 16-inch map. Every holding was treated as a separate field, and surveyed and plotted on the map. Whereas in the Madras Survey, in addition to a 16-inch map, holdings to a maximum number of 10 were clubbed to form survey fields of four and eight acres in wet and dry lands, for each of which a large scale plan on the 40 or 80-inch scale was prepared. Asked why that work could not be done by highly-trained officers locally recruited, the witness said that locally-recruited officers had been tried and some had failed. For instance, an ex-officer of a British regiment was put on probation for some time and had failed hopelessly in mathematics.

70775. Of the 15 appointments in the Service nine were held by Europeans, four by Indians and one by an Anglo-Indian. The remaining appointment was held, sub. *pro tem.*, by an Indian now attached to the Lands Records Department. The vacancy appertained to the European cadre. Two of the Indian officers were employed in the Central office, one was on furlough on medical certificate, and the other was on other duty as a Deputy Collector. Europeans were in charge of all the parties.

70776. He suggested that Indian officers should not be appointed by direct recruitment, but by promotion from the subordinate ranks. Promoted officers should generally be graduates, but he would not debar a good man from being promoted merely on the ground that he was not a graduate. He objected to direct recruitment, because it was absolutely impossible to tell whether a man would turn out well or not. The mere fact that he was a graduate was no criterion of his value as a Survey officer. One stronger reason which he had for not desiring direct recruitment was that survey work was uncongenial to an educated Indian.

70777. He had proposed a time-scale for all the officers in the Department, with the exception of the Director, but, on further consideration, he would be in favour of a charge bar between the Rs. 300 grade and the Rs. 900 grade.

70778. (*Mr. Madge.*) There was no comparison between the natural aptitude for survey work of the Madrasi and the North-West Frontier Province man. Most of the men who had distinguished themselves in the Survey of India Department were Muhammadans, who took to field work more keenly than Hindus.

70779. When men with excellent qualifications were available in such large numbers in England, it would be false economy to take on a cheaper locally-recruited man with lower qualifications. He was not aware of the fact that both domiciled Europeans and Anglo-Indians now held not only executive, but administrative posts in the Survey of India Department. It was the case in years gone by, but the conditions of service nowadays were totally different from what they were 30 or 40 years ago. Even as regards revisional work, the quality had altered in the last few years. The work was done now in much greater detail.

70780. The scale of pay in the Department was much less at the present time than it was 30 years ago. The existing six officers, excluding himself, had drawn during the first 20 years of their service about Rs. 35,000 less on an average than the nine retired, or deceased, uncovenanted civilian officers who had served in the Department from its inception in 1858 with the exception of the late Mr. G. P. Greene who was exceptionally fortunate in rising to the head of the Department some years before he had completed 20 years' service. In 1896 one appointment of Rs. 1,100 had been abolished, and another two posts worth Rs. 1,500 a month were later abolished in order to allow comparatively junior officers to retire. An agitation was started, and Government replaced two posts worth Rs. 1,800 a month. That meant three appointments worth Rs. 2,600 had been done away with, and two posts at Rs. 1,800 had been given back.

70781. (*Mr. Fisher.*) In Madras the survey was made in greater detail than in Bengal. For this reason a larger supervisory establishment was needed. But for many years past it had not been possible to attach an Assistant to each survey party.

70782. (*Mr. Sly.*) He did not know whether the Madras system of survey was exactly the same as the Bombay system. At the present time the Bombay Government had no Survey Department; they had abolished it altogether, and had instituted a Land Records Department.

70783 Every officer in the Madras Survey had learnt the technical work within the department. They had received no special training elsewhere. He himself, however, had done a course of field astronomy at the Royal Geographical Society's headquarters when in England on furlough some

years ago, and had introduced the subject in the curriculum for Probationary Assistant Directors.

70784. He had absolutely no objection to an Indian graduate being employed as a Survey officer, provided he proved his fitness for the post in the upper subordinate ranks of the department. It was impossible to decide beforehand whether an Indian would make a good Survey officer or not.

70785. (*Sir Valentine Chirol.*) He did not set up a higher standard for officers employed in the Madras Department than was found to be sufficient for officers employed in the Survey of India. Some excellent work had been done by Indians and Anglo-Indians in the Madras Survey, but his contention was that they must go in through the upper subordinate ranks. The work in the Madras Survey was very hard physically, and in this respect the Indian was handicapped more in the Madras Presidency than he was in the northern parts of India, as he seldom was a good man on a horse, and fatigued himself and wasted his time in camp by walking or travelling in slow-moving country carts.

70786. Asked whether he thought it was sound policy to exclude altogether a class which played an important part in the country, the witness replied he desired to get the best men.*

70787. (*Mr. Buckley.*) On two previous occasions it had been contemplated that the Madras Survey Department should come to an end and its place taken by a lands record and maintenance department. Those hopes had not been fulfilled, and unless an improved system of maintenance could be devised, it would be necessary to retain the Department on its present footing for a considerable time to come.

70788. With regard to his experience of the employment of graduates, there had been some who had been quite satisfactory in the upper subordinate grades, and some who had been the reverse. At present he had eight B.A.'s on probation, two of whom would have to be discharged for dishonest work. Most of the subordinate staff were temporary men, and therefore more supervision was required: there should be two officers with each party. If there were two officers to each party, the officers in the lower grade, on the Rs. 300 and Rs. 425 scale, would presumably be assistants and would not have the same responsibility as the officer in charge of a party.

(The witness withdrew.)

W. A. Hasted, Esq.,† Deputy Director, Madras Survey Department, called and examined.

70789. (*Chairman.*) The witness represented all the European gazetted officers of the Madras Survey Department. He occupied the position of Deputy Director of the second class and had completed twenty-nine years' service. He was recruited to the Service by nomination, and learnt the work in India.

70790. Appointments of Europeans should be made in England from schoolboys who had undergone training in survey at the Ordnance Survey Office, Southampton, for about one year, but if the policy of converting the department into a Land Records and Maintenance Office was persisted in, he would not then consider it necessary that officers should be appointed from England.

70791. In other provinces of India, land records duties were performed by officers locally recruited, and, as regards survey work, it was the case that such work was entrusted largely to provincial officers, but their work was not so arduous nor did they control the same number of men.

70792. The Service was exacting, and required great physical strength, and it was exceedingly difficult to obtain the right stamp of man in India to fulfil these conditions. During his tenure of office as acting Director he had tried to get such men, and had failed. He had received applications from eight or nine men, but they were certainly not of the class required, either as regards educational qualifications or as regards physique.

70793. He had suggested that a certain number of appointments should be filled by the direct recruitment of Indians, *i.e.*, direct recruitment of graduates in engineering, but since he made that suggestion he had altered his opinion, his reason being that while he was Acting Director he had entertained seven graduates in mathematics for the upper appointments in the upper subordinate service, and two of them had done very badly indeed since they were appointed. He would, however, reserve one-third of the gazetted posts for Indians and Anglo-Indian leaving discretion as to the method of selection. He would mainly draw his gazetted men by promotion from the subordinate ranks. He did not think any high qualifications were necessary for a Survey Officer who was ultimately to attain a position in the gazetted ranks; he would only require to possess a sound knowledge of mathematics. A man who had passed any matriculation examination ought to be fitted for the post of gazetted officer if of good moral character and physically fit.

70794. He suggested for European recruited officers, the same scale of salaries as was now paid to Executive and Assistant Engineers in the Public Works Department. He did not think that was asking for rather a high salary taking into consideration the conditions under which survey officers lived. Moreover, expenses of living had increased enormously. Under his scheme the European Survey Officer would have had no professional training prior to his entering the Service; he would simply go through a course of training in England at the Ordnance Office. He agreed that this would not be comparable to the training received by an officer of the Public Works Department. Those facts would have to be taken into consideration.

70795. He considered that the pay of the Madras Survey Officer should be higher on the average than that of the Provincial Officer in the Survey of India Department, because the latter was, to all intents and purposes, an inhabitant of his

---

* The witness afterwards wrote as follows:—"As this paragraph shows, I have no wish to *exclude* Indians or Anglo-Indians from their *share of* the appointments in the gazetted grades of the Department if fitted to fill them. What I tried to impress on the members of the Commission was that for vacancies in the European cadre the very best men—*i.e.*, graduates of the English universities, who had taken an honours degree in mathematics, should be recruited. As stated in my memorandum, men with these high qualifications are now being recruited for the Forest Department, the Traffic Branch of Indian State Railways, and, I believe, for the Egyptian Survey Department. The argument of one of the members of the Commission that less highly educated men have efficiently performed the duties of a survey officer in the past, and that there is no reason why they should not do so in the future is applicable to the above-mentioned departments; but, fortunately for those services, it was realised that when the best-educated men are available in large numbers, and at a moderate cost, it is false economy to employ any but them. Even though appointments in State railways are non-pensionable, but have a provident fund only, and an officer's services may be dispensed with at any time, there is, I believe, no difficulty in recruiting graduates of English universities."

† This witness was examined upon the written statement put in by Mr. Hatchell—*vide* paragraphs 70744–57.

own country, whereas a European was a foreigner and also because the latter did not control so many men and had a limited field season.

70796. All the officers in charge of survey parties in Madras, below the Director, were engaged on the same kind of duties. The term "Assistant" was a misnomer as the Survey Department was at present constituted. Every Assistant and every Deputy was in charge of a party, and there was no sense in the two titles except in so far as these officers were assistants to the director.

70797. He considered the Survey Department should be maintained on a permanent footing, because in his opinion maintenance of records was nothing but patchwork, and not very good patchwork at that. The results from the maintenance would not be anything like so good as the results to be obtained from revisional surveys. He did not think many of the old surveys were maintainable; a great deal of the country would have to be re-surveyed. The old maps were useless because the work had not been well done. He agreed that when the survey had been completed on efficient lines, it would then be merely a question of maintenance, and of showing changes on the map and this practically amounted to maintenance and land record work.

70798. (*Sir Valentine Chirol.*) He was doubtful whether the Bombay Government were satisfied with the work which had been done in the past. In fact the Land Records Director from Madras was deputed a short time ago to go to Bombay in order to enquire into their system of maintenance, and to see if a similar scheme could be adopted to Madras, but his report was unfavourable.

70799. (*Mr. Sly.*) He had no special technical training in survey work before coming to India. His educational qualifications when he joined were those of a sixth form school boy.

70800. The Service required another seven officers. Of the officers now in the Service three were in the Land Records Department, one being an Anglo-Indian and two Indians.

70801. For six parties twelve officers were required, and in the Central Survey Office, besides the Director, three additional officers were wanted. Fifteen officers in all were required to run the Survey Department. The Land Records Department should be kept quite separate.

70802. (*Mr. Fisher.*) On an average it took a recruit in the Department from 18 months to 2 years to learn his business, including a knowledge of the vernacular. He was then quite competent to do whatever work was required of him, under supervision.

70803. (*Mr. Madge.*) He recommended an ordnance survey training for European recruits as the one best suited to produce good officers. The educational qualification he would propose for Anglo-Indians would be the school-leaving certificate, the Matriculation examination, or a degree in Arts, and he would insist on good physique. A test of character, however, was a far better test in India than the passing of any examination.

70804. It was quite true that the revenue surveys of the Madras Presidency were unequalled in India, and probably in the world. They were most intricate, and the officers of the Service had been complimented on their work by the Surveyor-General of India, who recognised the excellence of the work from a professional standard. The Director of Surveys in Bengal, who came to Madras last year, also said he had never seen anything like it, and was suprised at the accuracy of the work, and the amount done.

70805. (*Chairman.*) With reference to his statement that the work of the Madras Survey had been judged as very accurate and specially intricate, it was true that there were portions of the Presidency where the work had been inaccurately done, but that work had been done in former years.

70806. (*Mr. Buckley.*) One reason of the inferior work which had been done in the Survey Department was that an attempt had been made to utilise village officers in the survey work.

(The witness withdrew.)

M.R.Ry D. Seshacharlu Garu,* Assistant Director, Madras Survey Department, called and examined.

70807. (*Chairman.*) He held the position of Assistant Director of Surveys in the last grade of the gazetted rank. He had 24 years' service. He passed his B.A. and B.C.E. degrees in the Madras University and entered the upper subordinate service as sub-assistant. He served 11 years as sub-assistant before being promoted to be acting Assistant Superintendent, and served six more years before being confirmed in the last grade.

70808. He would like to see 50 per cent. of the staff recruited from Europeans and 50 per cent. from statutory natives of India. In the case of the latter two-thirds should be recruited direct and one-third by promotion. His main reason for desiring to see a larger proportion recruited direct into the Service was that officers were not promoted to gazetted rank until late in life. An Indian officer obtained his degree at about age 21 or 22, when he was nearly in the prime of his life. Therefore if he started in the Department straight-away as a gazetted officer, Government would have the full benefit of his energies both in the field and in the office until he was about 45. After 45 the Indian aged more rapidly than his European colleague. If an Indian started as a sub-assistant on Rs. 150 it would be at least ten years before he could rise to the Rs. 300 grade, and he would then be 32 years of age. Then if he had ten years' service after that as an officer he would not be so efficient as a European officer of the same age. Again, if an Indian attained gazetted rank late in life he would not stand any chance of getting charge of a party.

70809. Looking to the interests of the Service he would suggest that in order to obtain the most efficient officers, the period of probation should not be less than two years.

70810. There might be advantages in a scheme which laid down that an officer should enter the subordinate ranks with a good University qualification and should then be selected, if qualified. for promotion after five or six years' service. He was afraid, however, that the best material would not be attracted to the service under such conditions. There was the possibility of a man not proving a success, and he would not like to be declared a failure after six years of service; he would sooner go into a Department where his future was assured than into one where it was doubtful.

70811. He agreed that European recruits should be brought out from England.

70812. Asked whether an officer recruited from abroad should be paid a higher salary than a locally-recruited man, he said that an Indian who could command Rs. 200 in Madras would be perfectly willing to perform similar duties in Burma or other distant places for 50 per cent. more salary. But if an officer who could command £500 or £600 per annum in England was willing to come to India at £900 per annum, witness did not see where the question of any further allowance came

---

* This witness was examined upon the written statement put in by Mr. Hatchell—*vide* paragraphs 70744–57.

in. It could be inferred, however, from his first statement that he agreed with the principle of a foreign service allowance.

70813. (*Mr. Madge.*) He did not consider that a mere examination success was a better test either of character or of mental equipment than actual service. That was why he suggested that the period of probation should be extended to at least two years. He preferred, however, direct recruitment to promotion from the inferior service. Not a very high degree of mental equipment was required for the Service; it was more a matter of physique. He would not agree that that was all the more reason why men should be promoted instead of directly recruited. Other matters had to be taken into consideration.

70814. (*Mr. Fisher.*) He would be inclined to insist upon a B.A. degree as a qualification for entrance to the Department, because University life gave a man a much wider outlook.

70815-71043. (*Mr. Buckley.*) He would prefer a time-scale to the present graded scale.

(The witness withdrew.)

LIST OF APPENDICES.

APPENDIX I.

Memorandum prepared by the Government of Madras relating to the Survey Department.

I

1. SURVEY DEPARTMENT.

Gazetted Staff.

At the time of the last Public Service Commission, the gazetted staff of the Survey Department consisted of 18 officers distributed among five Survey Parties and the Central office at Madras. All the appointments were held by non-domiciled Europeans in accordance with the policy pursued till then. It was expected at the time that the survey of the Presidency would probably be completed soon and the Department abolished in a few years. In his despatch No. 17, dated 19th December, 1889, the Secretary of State suggested that in view of the contingency of survey operations coming to a close soon, the question of disposing of the Survey Staff would have to be considered, and he also desired to know if the village maps and records were maintained in this Presidency and corrected with sufficient care year by year so as to obviate the necessity for a resurvey at the expiration of the Land Revenue Settlement current. *Pari passu* with the question of reduction of Survey staff, the question of maintenance of Survey records engaged the attention of Government, and schemes framed from time to time were under consideration and discussion for several years. On the hypothesis that the ordinary professional work of the Survey Department would be completed first by 1895 and then by 1897, reductions were made in the Survey Department. It was first proposed to remodel the Department with the object of making maintenance of Survey and Survey records its principal duty. To this end the districts of the Presidency were divided into six Survey divisions, each of which was placed in charge of a gazetted Survey Officer. This scheme proved a failure for more than one reason and at the same time it was clear that the professional work of the Survey Department was by no means at an end. It was found that a separate staff was required for land records work and that the retention and strengthening of the professional Survey staff was imperative. The subject was under consideration and correspondence with the Government of India until, in 1902, Mr. R. C. C. Carr was placed on special duty to work out proposals after a full investigation of the actual condition of the Survey records in each taluk of the Presidency. After careful consideration of Mr. Carr's report, the Government submitted in 1903 to the Government of India a scheme for the reorganisation of the Survey Department and the formation of a Land Records Department. From 1903 the Survey Department was placed under the direct control and orders of the Board of Revenue in order to secure continuity of policy in the work of the Department. The scheme received the sanction of the Secretary of State in 1905. Its essential features were the reorganisation of the superior staff of the Survey Department with the two-fold object (1) of reducing its strength to the minimum number required to carry out the Survey operations and thereafter to maintain the Survey record, and (2) of improving the prospects of the Survey Officers in the Department at the time who had suffered from slow promotion, and the creation and maintenance of a Land Records agency throughout the Presidency. The forecast of Survey operations framed in 1903 proved too sanguine and it has been found necessary to retain the existing six Survey parties longer than was anticipated. Need has also been felt for strengthening the gazetted supervision of the parties and the Central office by providing two officers for each party, and three officers for the Central office instead of two as at present. A revised scheme of Survey operations with proposals to strengthen the gazetted staff and the party establishments was submitted to the Government of India in June, 1911. Before passing orders on these proposals, the Government of India asked this Government to consider the question of reducing the cost of Madras Surveys, and at their instance the services of Lieutenant-Colonel Crichton of the Bengal Surveys were obtained to examine the system of Surveys in this Presidency. His suggestions have been considered by Government, and the Government of India have been informed that it is found impossible to make any reduction in the cost of Survey parties, and that it will be necessary to retain the Department for several years to come and to strengthen the staff as proposed in the letter of 20th June, 1911.

2. *Number and pay.*—The Survey Department in 1887 consisted of eighteen appointments as follows (distributed among five parties and the Central office)—

	Rate of pay. Rs.	Monthly total. Rs.
One Superintendent of Survey	1,500	1,500
Two Deputy Superintendents, first class	1,100	2,200
Four Deputy Superintendents, second class	* 750	3,450
Three Assistant Superintendents, first class	550	1,650
Five Assistant Superintendents, second class	425	2,125
Three Probationary Assistant Superintendents	200	600
Total per mensem ...		11,525
Total per annum ...		1,38,300

* One was drawing pay at Rs. 1,200, being a military officer.

The above number was reduced by two in 1887—
One Assistant Superintendent, first class.
One Assistant Superintendent, second class.

In 1891 the pay of the Superintendent of Survey was raised to Rs. 1,500—60—1,800. Instead of three Probationary Assistant Superintendents, six appointments of Assistant Superintendents, third class, on a salary of Rs. 200 a month rising to 300 when the incumbents are fully qualified were created. In 1897 two appointments of Deputy Superintendents, second class, and in 1898 one appointment of Deputy Superintendent, first class, were abolished, so that prior to the reorganisation of 1905 the gazetted staff was as follows (distributed among six parties and the Central office):—

	Rs.
One Superintendent ...	1,500—60—1,800
One Deputy Superintendent, first class ...	1,100
Two Deputy Superintendents, second class ...	750
Two Assistant Superintendents, first class ...	550
Four Assistant Superintendents, second class	425
Six Assistant Superintendents, third class ...	300
Total per mensem ...	8,900
Total per annum ...	1,06,800

APPENDIX I. (*continued*).

In 1905 the following cadre including five appointments of Land Records Superintendents was sanctioned:—

Scale for new appointments and ultimate scale.

	Rs.
One Deputy Director ...	1,200—40—1,400
Two Assistant Directors, first class	900
Two Assistant Directors, second class	700
Two Assistant Directors, third class	550
Two Assistant Directors, fourth class	425
Three Assistant Directors, fifth class (during period of probation, Rs. 200)	300
	Total Rs. 7,383⅓ per men.
	Or Rs. 88,600 per ann.

The probationers have to be appointed as settlement probationers, there being no provision for such probationers in the Survey Department. The

Special scale for the Officers in the Department at the time of reorganisation.

	Rs.
One Superintendent ...	1,500—60—1,800†
One Deputy Superintendent, first class ...	1,100
Two Deputy Superintendents, second class ...	900
Two Assistant Superintendents, first class ...	750
Two Assistant Superintendents, second class	550
Two Assistant Superintendents, third class ...	425
Five Assistant Directors, fifth class (during period of probation, Rs. 200)	300
	9,550 per men.
	Or Rs. 1,14,600 per ann.

† Mr. D. Hatchell, the present permanent director, is alone permitted to draw this scale of pay.

In 1907 the designation of the Superintendent, viz., "Deputy Director of Survey" was changed to "Director of Survey."

The proposals submitted to the Government of India in June, 1911, provide for the following cadre:—

Number proposed for the next few years.

	Rs.
One Director of Survey ...	1,200—40—1,400
Two Assistant Directors of Survey, first class	900
Two Assistant Directors of Survey, second class ...	700
Two Assistant Directors of Survey, third class ...	550
Two Assistant Directors of Survey, fourth class ...	425
Twelve Assistant Directors of Survey, fifth class ...	300
Two probationers on Rs. 200 each.	

Government have recently proposed the addition of two appointments of probationers on Rs. 200 per mensem to the Survey Department cadre.

Lieut.-Colonel Crichton has in his note on Madras surveys laid great stress on the need for additional European supervision in the interests of

Ultimate scale.

	Rs.
One Director of Survey ...	1,200—40—1,400
Two Assistant Directors, first class	900
Two Assistant Directors second class	700
Two Assistant Directors, third class	550
Two Assistant Directors fourth class	425
Five Assistant Directors, fifth class	300
Total ...	7,983⅓ per mensem.
Two probationers on Rs. 200 each.	

3. *Recruitment and training.*—When the Department was originally created appointments to the gazetted staff were made by nomination. Subsequently competition was introduced open to all classes of British subjects. The competitive system, was, however, subsequently abandoned and either Military officers or Uncovenanted Civilians were appointed on the nomination of the Governor. There was only one Military officer in the Department in 1887. In years just previous to 1887 it has been customary to appoint as probationers young men, principally the sons of Civil or Military Officers, who had been at good schools in England.

In 1887 all the appointments were held by non-domiciled persons in accordance with the policy pursued up to that time. A change in the policy was affected in 1887 at the instance of the Finance Committee on the revision of Provincial contracts. But Indians were promoted to the gazetted grade for the first time in 1892.

The practice for some years thereafter was to appoint to vacancies in the gazetted staff a European and an Indian alternately.

It was decided by Government in 1908 that it was not desirable to lay down any hard and fast rules either that Land Records Superintendents should invariably be Europeans or as to the number of appointments which should be held by Europeans and Indians and that there was no longer any reason for the continuation of the system of alternate appointment of Europeans and Indians. The Government also decided that candidates for appointment as gazetted Survey Officers should have a year's preliminary training in Land Revenue administration.

economy and is against Indian supervision which in his experience has proved untrustworthy in the field.

Till 1905 probationers appointed to the Survey Department were required to go through a course of training extending to two years in surveying and departmental duties and to pass an examination in mathematics and in a vernacular language. The course of training and syllabus of instruction were revised in 1910 and Assistant Directors appointed to the Department for the first time have to pass an entrance examination in mathematics and then to undergo training for 22 months in a survey party, the Central Survey Office, and a settlement party, at the end of which period and before they are confirmed they must pass an examination in survey and in a vernacular.

Of the 15 appointments in the gazetted staff nine are at present held by Europeans, one by an Anglo-Indian and five by Indians.

4. *Leave, pension, etc., rules.*—For the purpose of calculation of acting allowances, the gazetted appointments in the Survey Department are classed with appointments which are open to and may, in practice, be held by a member of the Indian Civil Service or a Military Officer.

The European service leave rules are applicable to officers of not lower rank than Deputy Directors of Survey, second class, in the special scale or Assistant Director of Survey, second class, in the permanent scale. No exchange compensation allowance is allowed to officers appointed to the Survey Department since 1905. Any officer of the Department whose pay is less than Rs. 700 a month when placed in independent charge of a full survey party draws a charge allowance of Rs. 100 a month,

subject to a maximum emolument of Rs. 700. Assistant Directors of Survey below the rank of second-class (new scale) and Deputy Directors of Survey below the rank of third-class (old scale) permanent or officiating who may be employed at the Presidency town and who may be declared by the local Government to be holding permanently or temporarily an appointment not less important than the independent charge of a party, are entitled to a charge allowance of Rs. 100 per mensem. Assistant Directors of Survey, first and second class (new scale), and Deputy Directors of the first three classes (old scale) stationed at Madras, are entitled to a Presidency allowance of Rs. 60 a month and Assistant Directors of lower grades of Rs. 100 a month.

Assistant Directors of Survey, fourth and fifth class, and Probationary Assistant Directors of Survey are rated as officers of the first class for travelling allowance purposes. The Director of Survey draws a special daily allowance of Rs. 7-8-0, and the Assistant Directors of Survey who draw Rs. 500 and above a special rate of daily allowance of Rs. 5 and the others an allowance of Rs. 4. Officers of the Madras Survey Department are allowed to draw mileage in lieu of daily allowance or actual expenses in special cases. They are not supplied with tents by Government nor do they draw tentage, but the tents they provide at their own expense are carried at Government cost. The ordinary pension rules in the Civil Service Regulations are applicable to the officers of the Survey Department.

2. LAND RECORDS DEPARTMENT.

5. The Land Records Department, in its present form, had no existence at the time of the last Public Service Commission. The question of maintenance of boundary marks and survey records engaged the attention of the authorities from 1864. The subject, however, came into prominence on the receipt of the Secretary of State's Despatch No. 17, dated 19th December, 1889, referred to above. It was at first contemplated that all survey work whether in the direction of keeping up the existing demarcation and recording fresh changes or in the direction of making original surveys of special tracts left unsurveyed by the Survey Department at its abolition would be done by karnams and Revenue Inspectors assisted, if necessary, by temporary surveyors. To train and assist karnams there was to be a district surveyor taken from the Survey Department on about Rs. 100 per mensem in each district. To supervise the work there was to be a Survey Officer taken from the Survey Department for every four or five districts to be styled Assistant Commissioner—there were to be six in all—and at the head there was to be a Deputy Commissioner on Rs. 1,200—1,400 to whose office was to be attached a photo-zincographic office. The scheme was not approved by the Government of India. Meanwhile the system was tried as part of the Survey Department and failed and was eventually abandoned in 1900.

In 1903 a scheme of land records maintenance was first brought into force. Under this scheme the districts of the Presidency are divided into five groups, each group being in the charge of a Superintendent of Land Records. To each district a Land Records Tahsildar and to each taluk a Land Records Inspector is allotted and the Land Records Tahsildar is assisted by a Deputy Surveyor and a Draftsman. The Land Records Superintendents are under the control of the Director of Land Records, while the Land Records Tahsildars and the Land Records Inspectors are under the control of the collectors of districts.

6. *Director of Land Records.*—In 1891 an appointment of a Civilian Deputy Director of Land Records was created at the instance of the Government of India to supervise the work of subordinate Land Revenue officials in connection with the maintenance of land records. This appointment was, however, in abeyance from 1894 and the duties were discharged by the Deputy Director of Agriculture till 1903 when the appointment was revived as part of the scheme of land records maintenance. The designation of the appointment was subsequently changed into "Director of Land Records." The Director is the adviser to the Board in Land Record matters. The appointment is at present included in the first grade of Sub-Collectors and carries with it a local allowance of Rs. 250 a month. Further, the Director of Land Records may, if he would otherwise be acting as Collector, draw the salary of an acting Collector subject to a total emolument of Rs. 1,800 per mensem.

7. The system of recruitment and training and leave, etc., rules of the Survey gazetted staff apply also to the Land Records Superintendents.

II.

[*Additional particulars required in paragraph 1 of the Joint Secretary's letter dated 1st August*, 1913.]

1. *Present regulations as to Recruitment, Training and Probation, and whether these regulations are satisfactory.*—The present system of recruitment has not proved satisfactory. The Government have come to the conclusion that the Survey Department must be kept on for a considerable number of years, and they consider that some better system of recruitment will have to be devised. Possibly by suitable alterations in the present scale of pay of the Department, candidates who are on the waiting list for Colonial Survey appointments or candidates selected under a similar system could be obtained. Present rates of initial pay in Madras are lower than those prevailing in Colonial Survey Departments.

2. *The rates of Pay and Allowances in force in* 1890 *and* 1900 *and at the present time, and whether the present rates of pay and allowances are satisfactory.*

1890.	1900.	1913.*
One Superintendent, Revenue Survey (Rs. 1,500).	One Superintendent (Rs. 1,500—60—1,800).	One Director (Rs. 1,200—40—1,600).
Two Deputy Superintendents, first class (Rs. 1,100).	One Deputy Superintendent, first class (Rs. 1,100).	Two Assistant Directors, first class (Rs. 900).
Four Deputy Superintendents, second class (Rs. 750).	Two Deputy Superintendents, second class (Rs. 750).	Two Assistant Directors, second class (Rs. 700).
Two Assistant Superintendents, first class (Rs. 550).	Two Assistant Superintendents, first class (Rs. 550).	Two Assistant Directors, third class (Rs. 550).
Four Assistant Superintendents, second class (Rs. 425).	Four Assistant Superintendents, second class (Rs. 425).	Two Assistant Directors, fourth class (Rs. 425).
Three Probationary Assistant Superintendents (Rs. 200).	Six Assistant Superintendents, third class (Rs. 300),	Six Assistant Directors, fifth class (Rs. 300).
		Personal allowance to present Director (Rs. 400).
House-rent allowance for a Deputy Superintendent, Rs. 60 per mensem.	Seven (exchange compensation allowance).	One (Presidency Allowance), Rs. 100.
	Presidency allowance for an Assistant Superintendent, Rs. 100 per mensem.	One (Presidency Allowance), Rs. 60.
		Six (exchange compensation allowance.

* *Special scale.*

	Rs.		Rs.
One Deputy Director (first class) ...	1,100	Two Deputy Directors (third class) ...	750
Two Deputy Directors (second class)	900	One Deputy Director (fourth class) ...	550

No exchange compensation allowance to entrants since 1905.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—Present appointments are divided into classes as follows:—

	Rs.
One Director of Survey - -	1,200—10—1,600
Two Assistant Directors, first class	900
„ second class	700
„ third class	550
„ fourth class	425
Six Assistant Directors, fifth class,	Rs. 300 (Rs. 200 while under training).

[Special scale contains Deputy Directorships in four classes as shown under item (*ii.*) *supra.*]

There is one leave reserve at present, but it has been proposed in connection with the proposed reorganisation of the Department that this reserve should be abolished. No provision exists for training in the cadre, but some provision is considered necessary and it has been proposed that two probationerships should be created.

4. *What appointments outside the authorised cadre are held by Officers of the two Services.*—Temporary appointments connected with boundary disputes and special surveys are held occasionally by officers of the Survey Department.

5. *Whether any addition is required to the present cadre.*—Additions to the cadre are required. In letter No. 1887, dated 20th June, 1911, to the Government of India, six additional appointments have been proposed.

APPENDIX II.

Statement of the Civil Appointments on Rs. 200 *a Month and over held by Europeans, Anglo-Indians, and Indians on the* 1*st April,* 1913, *in the Madras Survey Department.*

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

ON THE

PUBLIC SERVICES IN INDIA

RELATING TO THE

BURMA LAND RECORDS DEPARTMENT,

At Calcutta, Thursday, 22nd January, 1914.

PRESENT:

THE EARL OF RONALDSHAY, M.P. (*in the Chair*).

SIR MURRAY HAMMICK, K.C.S.I., C.I.E.
SIR THEODORE MORISON, K.C.I.E.
MAHADEV BHASKAR CHAUBAL, Esq., C.S.I.
ABDUR RAHIM, Esq.

M. S. D. BUTLER, Esq., C.V.O., C.I.E. (*Joint Secretary*).

J. HADDOCK, Esq., Superintendent of Land Records, Insein, and

MAUNG PE MAUNG, K.S.M., Superintendent of Land Records, Amherst.

These Officers were examined together on the following Written Statement relating to the Burma Land Records Department, being the corporate opinions of the Officers of the Department.*

71044. **(I) Method of Recruitment.**—The rules at present in force, as contained in Part E, Chapter II, of the Burma Land Records Manual, are quite suitable.

71045. **(II) System of Training and Probation.**—The existing systems are described in Parts E and F, Chapter II, of the Burma Land Records Manual, and work satisfactorily.

71046. **(III) Conditions of Service.**—(*a*) Matrimony for Assistant Superintendents should be absolutely forbidden; the present rule merely applies to the two and a half years of training, and is insufficient protection of the interests of the Department; marriage impairs a young officer's efficiency.

(*b*) Officiating appointments should, provided the grade system is retained, be permitted in the Superintendents' grades; at present it is only allowed for classes, *e.g.*, from Assistant Superintendent to Superintendent or Superintendent to Assistant Director.

(*c*) House Allowance should be given to Land Records Officers, where drawn by other Departments, as in Rangoon; at present it is only given to officers classed as "Imperial," though those classed as "Provincial" would have the greater need for the allowance. It should also be given in Districts where Government Quarters are not provided for Superintendents.

(*d*) Exchange Compensation Allowance should be abolished in all services; if not, the Land Records Department should also be given it. Exchange affects all officers alike.

(*e*) Burma Allowance should be granted to Land Records Officers if given to those of any other Department (*e.g.*, Forest, Survey, Public Works, Medical, Postal, Telegraph, etc.), whether or not specially recruited for the Province; all are equally affected by the high cost of living in Burma.

(*f*) Local Allowance should be given in all cases to Land Records Officers for Special Charges involving increased responsibility or embracing exceptional conditions *e.g.*, Map Section, Town Registration, Special Survey Party, etc. At present an allowance of Rs. 100 per mensem is allowed only to the Officers in charge of the Map Section of the Government Press at Rangoon, and to the Registrar of Town Lands in Rangoon. The Superintendent in charge of Special Surveys, Burma, whose headquarters are Rangoon, is not in receipt of any Local Allowance; many years ago a former Superintendent who had a similar charge was given a Local Allowance of Rs. 100 per mensem. The Assistant Superintendent of Stamps, the Registrar of the Chief Court, the Assistant Collector of the

* This written statement was drawn up at a Conference of Land Records Officers held at Rangoon on the 11th May, 1913, and represents the views of the members of the Land Records Department. The Committee was composed of Mr. J. C. Clancey, I.S.O., president, and the following members, Messrs. L. E. Palmer, F.R.G.S., W. E. Johnson and W. J. Baker, Maung pe Maung, K.S.M., and Messrs. N. W. Purchase, E. M. Korper, C. S. McKertich, F. A. de Souza, C. F. Cooper, H. A. Hardless, C.E., W. E. S. Swiney, and R. V. Littlewood.

Rangoon Town District, the Secretary and the Assistant Secretary to the Financial Commissioner and the Deputy Director of Land Records at Rangoon each receives a Local Allowance of Rs. 200 per mensem, and the Additional Judge of the Small Cause Court at Rangoon gets an allowance of Rs. 150 per mensem.

(*g*) All officers of the Department, who are Gazetted Officers, should be classed as Class I for the purposes of Travelling Allowance; at present those on pay of Rs. 500 and under are only entitled to travel, as their Clerks, Class II by rail. Daily and mileage rates should be granted as follows, viz., (i) Assistant Superintendents at Rs. 4-8 per day and at As. 6 per mile; (ii) Superintendents on Rs. 400 to Rs. 500 pay at Rs. 6 per day and at As. 9 per mile; Superintendents on over Rs. 500 pay at Rs. 7-8 per day and at As. 12 per mile, as now in force.

(*h*) One appointment of Settlement Officer and two of Assistant Settlement Officers should be open to Superintendents, as for Extra Assistant Commissioners; formerly a Superintendent of Land Records worked with great credit for years as Settlement Officer. A Land Records Officer should also be eligible for the post of Deputy Director of Land Records. There are 47 appointments, including six Assistant Superintendents, in the Land Records Department against 145 in the Provincial Civil Service, or in the proportion of 1:3. Yet only one high post of Assistant Director on a pay of Rs. 1,000 is open to Land Records Officers whereas Extra Assistant Commissioners are given two appointments of District Judge, two of Deputy Commissioner and one of Settlement Officer; the first two classes of appointment have a sliding scale of pay of Rs. 1,000, Rs. 1,200 and Rs. 1,600, and the last of the three classes has a fixed pay of Rs. 1,000.

(*i*) The number of extra appointments to fill leave vacancies is 14 per cent. of the District and Special Charges plus the Assistant Director, and for casualties 2½ per cent. These have proved to be inadequate. The percentages should be respectively raised to 20 and 5. In the Burma Commission. In the Burma Commission 27 per cent. is allowed for absentees.

(*j*) The Officers of the Land Records Department and Extra Assistant Commissioners are both on the same social and official footing, and any future advantages in respect to pay and allowances, and the like, extended to the latter should *pari passu* be made equally applicable to the former.

71047. **(IV) Conditions of Salary.**—The general trend in most Departments now is towards a time-scale pay in supersession of the fixed pay system. A time-scale of pay which exists in the Forest, Accounts, Public Works and other Departments, is desirable for Land Records Officers also. Assistant Superintendents should get Rs. 200 to Rs. 300 by annual increments of Rs. 20. Superintendents should begin on Rs. 400 rising to Rs. 1,000. From Rs. 400 to 600 the annual increments should be Rs. 25, from Rs. 600 to Rs. 800 the increments should be Rs. 33⅓, and from Rs. 800 to Rs. 1,000 they should be Rs. 40; but advancement above the Rs. 600 grade should only be given to those possessing good ability and with a good record of work. The Assistant Director's salary should be Rs. 1,200 to Rs. 1,500 by annual increments of Rs. 50, and appointment should be by selection from among the Superintendents; the position demands special knowledge and experience and carries with it enhanced responsibilities and expense, and whereas the other Assistant to the Commissioner of Settlements and Land Records, designated the Deputy Director, enjoys the privileges of a Local Allowance, Officiating Allowance, House Allowance, Burma Allowance, and Exchange Compensation Allowance, the Assistant Director is ineligible for any of these.

71048. **(V) Conditions of Leave.**—(*a*) Furlough should be granted after the first eight years of active service, and thereafter after every seven years of similar service. It should not be limited to an aggregate of two years, as now, in an officer's entire service; it was not so in years gone by.

(*b*) Long leave, which is usually given on half-pay, might be allowed to be commuted, if desired, to a shorter period with a higher allowance; thus, if two years' leave at Rs. 200 per mensem is due, one year might be taken instead at Rs. 400 per mensem, or one and a half years at Rs. 266⅔ per mensem; the balance of the leave being forfeited.

(*c*) On return from furlough an officer of the Provincial Services may not take the next furlough, though earned, till eight years have elapsed since his return. The period might be altered to four years; that for the Imperial Services is three years.

(*d*) Privilege leave should be allowed to accumulate to the extent of six months, limited to twice in an officer's service, as officers with small salary cannot generally afford to go on long leave on half pay.

(*e*) All leave with allowances taken in India should count as service, as in the case of such leave taken out of India.

71049. **(VI) Conditions of Pension.**—(*a*) Service for pension should be allowed to count from 18 years of age, the age at which recruitment in the Department is allowed, and pension should be given after 25 years' pensionable service.

(*b*) Retirement should be compulsory at the age of 55 years. The work necessitates a strenuous out-door life, subject to much exposure and hardship; and consequently officers beyond that age are not generally able to do much field work.

(*c*) The Assistant Director should be eligible for the extra pension of Rs. 1,000 per annum after three years' tenure of the appointment.

(*d*) Pensions drawn out of India should be made payable at the rate of two shillings to the Rupee. At the time the maximum pension of Rs. 5,000 was fixed the exchange was at this rate, and the intention then was that this should represent a payment of £500 per annum.

71050. **(VII) Such limitations as may exist in the employment of non-Europeans and the working of the existing system of division of Services into Imperial and Provincial.**—(*a*) The Department should be open, as now, to (i) Domiciled Europeans and Anglo-Indians and (ii) Burmans of good family; but limited in the latter class, to a maximum of one-fourth of the total number of appointments, as in the Survey of India Department from which a number of the older Land Records Officers were originally obtained; at present Burmans form about one-sixth of the whole.

(*b*) The distinction between Imperial and Provincial Services should be abolished; it is the source of much bitterness, and is even worse than the former distinction between "Covenanted" and "Uncovenanted."

71051. **(VIII) Relation of the Service with the Indian Civil Service and other Services.**—(*a*) The Administrative Staff of the Department consists of (i) a Commissioner of Settlements and Land Records; (ii) a Deputy Director of Land Records, and (iii) an Assistant Director of Land Records. The first named appontment is held by a senior officer of the Burma Commission; the second by a junior officer of the Burma Commission; and the third by an officer chosen from among the Superintendents. The pay of the Commissioner is Rs. 2,750; that of the Deputy Director of Land Records carries with it a local allowance of Rs. 200 per mensem, subject to a maximum of Rs. 1,600 that of the Assistant Director of Land Records is Rs. 1,000 fixed. The officer who holds the post of Deputy Director of Land Records usually retains it for a couple of years only, as the appointment forms a training ground for eventual higher positions of Revenue Secretary, Commissioner of Settlements and Land Records and Financial Commissioner.

(*b*) It should be clearly understood, as laid down by Government, that both Assistants are directly subordinate to the Commissioner of Settlements and Land Records alone; otherwise the position of the second assistant would be intolerable. The designation of the Deputy Director of Land Records should be changed to that of first Assistant Commissioner of Settlements and Land Records, and of the Assistant Director to that of second

Assistant Commissioner of Settlements and Land Records, in the manner of the two Financial Commissioners of the Punjab. The reason for the proposed change is that the Head of the Department is styled the "Commissioner of Settlements and Land Records," and no longer as "Director," and friction between the Assistants will also, thus, be altogether avoided. At present both assistants are precluded from engaging in the work of the settlement section of the office, whereas formerly, when there was only a single assistant—the Assistant Director—such work was done, as well as the work of the agricultural section which was also then under the direction of the Commissioner of Settlements and Land Records. In future both assistants might well be required to take part in the work of all the sections of the office, viz., Settlement, Land Records, Inland Trade, Agricultural Advances, Scarcity and Famine, Agricultural Statistics, Crop Forecasts and Reports, Survey Schools, Special Surveys, etc. The different separate duties would be assigned, wholly or in part, to the Assistants at the discretion of the Commissioner of Settlements and Land Records. In this way, too, the Commissioner of Settlements and Land Records would receive considerable relief which is both urgent and necessary.

(c) Generally speaking, the relations between the District Officers (Deputy Commissioners) and their Superintendents of Land Records have been cordial; but often the latter, who are gazetted officers and supposed to have and maintain a position, are not treated with the courtesy and consideration that they are entitled to.

Mr. J. Haddock and Maung Pe Maung called and examined.

71052. (*Lord Ronaldshay.*) Both witnesses agreed with the views put forward in the written statement, with some slight modifications on the part of Mr. Haddock.

71053. Mr. Haddock said the department contained a Commissioner and a Deputy Director, drawn from the Burma Commission. In the department proper there was an Assistant Director, 41 Superintendents, and 6 Assistant Superintendents, on salaries ranging from Rs. 150 to Rs. 800 a month, the Assistant Director receiving Rs. 1,000.

71054. The Survey of India Department made the original surveys, and prepared maps for each district on a scale of 16 inches to the mile. The maps represented every field plot, and each plot was numbered. The Survey Department also made an area statement. Those two documents were supplied to the Settlement Department, and with their aid the settlement staff commenced their operations. The Settlement Department then inquired into boundaries, titles, etc., prepared a record of rights, and divided the country into soil tracts and classes, and proposed rates. Those records were then handed over to the Land Records Department, which kept the records up to date, attending to all changes in survey, alterations of boundaries, classification of soils, and new expansions, and applying the rates sanctioned by the Government. In fact his department kept up to date the original records made by the Settlement Department.

71055. The age of 18 was too young for recruitment. The age limits should be from 20 to 25. Maung Pe Maung preferred an age limit of from 21 to 25.

71056. Mr. Haddock said a scheme for training the officers at Dehra Dun fell through, and a local scheme had been devised for a local survey party, in charge of a Land Records Superintendent, for the training of all probationers. They should have a survey training of 21 months, and a land records training of 9 months, or 30 months in all. That length of training was very necessary. There were two grades of Assistant Superintendents, the second grade being probationers undergoing training, who were paid at a rate of from Rs. 150 to Rs. 200. That pay was insufficient.

71057. There were, including the latest recruits, eleven Burmans now in the service. The department should be open to Europeans, Anglo-Indians, and Burmans alike. He was not in favour of laying down any rough proportion of Burmans, but a certain number of Europeans were required for a stiffening effect, and the Burman cultivator preferred to have a European, though the Burman made an excellent officer. Maung Pe Maung pointed out that when the department was first formed there were not many Burmans who had the necessary training to join, but there was quite a number of them now, and every opportunity was given to them to enter the department. He was satisfied with the present system.

71058. Both witnesses favoured a time-scale of pay.

71059. Mr. Haddock would make it compulsory to retire at 55 years of age, even if a time-scale was adopted, because a land-record officer, who did his duty, was absolutely unfit for work after 55, when he had spent so many years tramping through paddy fields under the sun in all weathers. Maung Pe Maung agreed.

71060. Mr. Haddock said that, if a time-scale was adopted, officiating allowances as between grades would not be required.

71061. With regard to the Burma allowance, he thought the views of the officers had not been clearly expressed in the written statement. They did not so much want a Burma allowance as extra pay to meet the cost of living in Burma, which was very much higher than it used to be. The whole of the Service was recruited in Burma for work in Burma, and it was more satisfactory to lay down a scale of pay which was suitable for Burma.

71062. The Burma Land Record Department was essentially a Provincial Service, but there were Imperial Services working in Burma, and possessing privileges which Provincial Service men had not, and consequently there was an invidious distinction, and that distinction was felt both in social and official life. The officers of the department desired to have the same privileges as were accorded to the European recruited services, both with regard to leave and allowances. If it was considered necessary for Europeans recruited in Europe to go to England in order to recuperate from the effects of the climate, it was also necessary for Europeans, Anglo-Indians and Burmans born and recruited in Burma, who practically started with the handicap of having been in the country before joining the service. He himself had always drawn such small pay that it had been practically impossible for him to take long leave until after 24 years' service. He considered that there should be one set of leave rules for all services in India.

71063. The officers also wished to be allowed to commute a portion of their furlough on full pay. The cadre required strengthening if men were to take proper leave. It was in the interests of the department that men should be able to take short leave, and if they received full pay they would do so.

71064. A pension after twenty-five years' service would enable an officer to retire between the ages of 46 and 50, assuming he had joined between 20 and 25. Forty-five was rather a young age, but the nature of the service was such that, if an officer wished to retire he should be allowed to do so. Maung Pe Maung was of the same opinion.

71065. (*Sir Murray Hammick.*) Mr. Haddock said that when he spoke of the Imperial Services he referred to the Police, Forest, etc. What was desired was not really longer furlough, but furlough at more frequent intervals.

71066. At present it was not compulsory for an officer to join the Provident Fund.

71067. Men were not taken into the department from the Provincial Service, but were recruited on a standard educational qualification.

71068. (*Mr. Chaubal.*) With regard to the possibility of interchangeability between the Land Records Department, the Settlement Department and the Revenue Department, Mr. Haddock said the Land Records officers were excluded from joining the Settlement Department, but some officers had gone into the Provincial Service as Extra Assistant Commissioners, and Provincial Service men had gone into settlement work. The work of the Lands Records officer gave him better qualifications for settlement work than the Provincial officer. A Provincial officer, before coming into the Land Records Department, would have to undergo a training. Land Records officers were also Revenue officers, but an officer of the Provincial Service—that is, an Extra Assistant Commissioner—was not eligible for the Land Records Department, as he was not a surveyor. Such officers had only to put in three months on survey work, which was not a sufficient course for the Land Records Department.

71069. (*Sir Theodore Morison.*) With reference to the rule that all candidates for the department should be unmarried and undertake not to marry before the expiry of their period of probation, Maung Pe Maung said that Burmans, as a rule, married between 25 and 26, but the conditions did not press hardly upon them. There was no reason for such a rule with regard to a Burman officer, because when a man had undergone his training and was considered efficient, and had been confirmed in his appointment, his efficiency as an officer would not be impaired if he married. However, he approved of the present rule, which did not operate hardly on the officers.

71070. M. Haddock said that if the officers were placed on a time-scale, both Burmans and English should come under a rule that an officer should not marry within the first five years. Maung Pe Maung did not agree.

71071. Mr. Haddock said there was no special difficulty in recruiting on the present scale of salaries. No advertisements of vacancies were issued, but there was a register of men who had made applications for appointments, and the register at present contained about 40 names. There were only three vacancies last year. Maung Pe Maung thought there would be no vacancy for the next two years.

71072. Mr. Haddock said he had been asked by the superintendents to emphasise one or two matters before the Commission. One was a house allowance, which was badly wanted in Rangoon, as was proved by the fact that Imperial and other officers received the allowance. By the grant of allowances to certain officers landlords had been encouraged to increase the rents in Rangoon, and those who did not receive allowances had to pay the same rents as those who did.

71073. The next matter was that of exchange compensation. The standard of living of both Imperial and Provincial Officers was practically the same, and compensation allowance should be given to both. If that allowance was abolished for all services, naturally the Department would not expect to have it.

71074. Again three married Superintendents had written to him very forcibly on the subject of medical attendance, as they had suffered a great deal from outrageous charges for attendance on their families. They asked the Commission to consider whether the civil surgeon should not be directed to treat the families of officers free of charge as in the case of military officers or at a charge proportionate to income.

(The witnesses withdrew.)

71075-143. Mr. Haddock subsequently wrote as follows:—

In looking after the interests of my Superintendents I omitted to mention to the Members of the Royal Commission two matters which affect myself as Assistant Director of Land Records. The points are—

(i) In paragraph 71047 it is noted that the Assistant Director of Land Records should wait six years for the maximum pay suggested. Three years in my opinion should be ample. He is an officer whose worth is, or at least should be, beyond question.

(ii) I find that the minutes of the conference (paragraphs 71044-51) do not discuss the European Service Leave rules. I feel I have asked far too much in wanting such rules to apply to the whole of our officers, and Maung Pe Maung agrees with this view. We suggest instead the admission by the Government of India to the benefit of the European Service rules of officers of our department drawing pay not less than Rs. 800, in the same way as officers of the Accounts Department (Civil), Postal Department (Accounts), Customs Department, etc. (*vide* article 297, Civil Service Regulations)

(*2*) Maung Pe Maung has further reminded me that nothing was said about throwing open two Assistant Superintendentships to our Burman Inspectors of Land Records. We consider that our department suffers from incapable Inspectors, and to induce better men to join we desire to throw open two Assistant Superintendentships to these officers. This would mean better pay and better pension for them and need not be given till they are about 40 years old.

LIST OF APPENDICES.

I.—Memorandum dated the 30th June, 1913, prepared by the Government of Burma relating to the Burma Land Records Department 435

II.—Supplementary Memorandum prepared by the Government of Burma relating to the Land Records Department 437

III.—Statement of the Civil Appointments on Rs. 200 a month and over held by Europeans, Anglo-Indians, and Indians on the 1st April, 1913, in the Burma Land Records Department 438

IV.—Officials who furnished written evidence to the Royal Commission in connection with their Enquiry into the Burma Land Records Department, but who were not orally examined 438

APPENDIX I.

Memorandum prepared by the Government of Burma relating to the Burma Land Records Department, dated the 30th June, 1913.

(I) HISTORY AND GROWTH OF THE DEPARTMENT.

The duties of the Land Records Department are to keep up to date the large scale maps and the record of rights prepared by the Survey and Settlement Departments. It prepares the Land Revenue assessment rolls of the cadastrally surveyed area for each assessment season, thereby determining the assessment of each individual cultivator. In Upper Burma the land assessment is a fluctuating demand varying with the matured crop on the area cultivated by the individual assessees; in Lower Burma it varies with the cultivated area of the year. The Department also prepares crop forecasts and collects much statistical matter regarding rents, produce prices, etc., for use from year to year and for the information of the Settlement Officer when the time comes for revision of the current rates of assessment.

2. Supplementary Survey in Burma was introduced experimentally in 1880 in the more accessible parts of the Hanthawaddy and Bassein Districts. By the end of 1883, five districts had been brought under Supplementary Survey under the charge of three Superintendents, one from the Survey of India Department, one from the Provincial Settlement Department and one from the Subordinate Executive Service. Proposals for a gradual increase in the number of Superintendents as fresh districts came under Survey were approved by the Government of India in December of that year, but owing to a lack of funds the sanctioned totals were never worked up to, and by June, 1891, only eight districts in Lower Burma and one in Upper Burma with a total staff of eight superintendents had been brought under Survey. In view however, of the rapid extension of Survey which was expected in the future sanction was obtained in 1892 to an increase of the number of Superintendents to 20 (8 in Upper Burma) and to the appointment of three probationers. The intention was that gradually and as actual requirements necessitated, each district should be provided with a separate Superintendent who would work under the control of the Deputy Commissioner, and subject to inspection by a Director of Land Records. Six grades of Superintendents were to be formed on pay ranging from Rs. 200 to Rs. 800 a month. Owing to the special and technical character of the work demanded the appointments were to be distinct from the Subordinate Executive Service. The Department was to be open both to the Subordinate Executive Service of Burma and to the officers of the Junior Division of the Survey of India Department.

3. *The reorganisation of* 1899.—By 1897 the scheme sanctioned in 1892 had almost been worked up to, and it was found that with the growth of cultivation in Lower Burma several additional appointments were required to secure efficient administration. Proposals to this end were put forward and in 1898 the sanction of the Secretary of State was received to the appointment of six new Superintendents on pay ranging from Rs. 150 to Rs. 450.

4. *The reorganisation of* 1900.—Even before the above increase, which had been proposed chiefly with reference to Lower Burma, had been sanctioned, it had become clear that revenue would be lost in Upper Burma and that the cadastral surveys already carried out would be largely wasted unless the Land Records staff there was strengthened. Accordingly in 1900 the staff of Superintendents was raised to 31, and two additional posts of Probationers, making five in all, were created, while an Assistant Director on Rs. 1,000 was appointed to help the Director in supervision and inspection.

5. *The reorganisation of* 1905.—On the formation of the Pyapon District an additional appointment was sanctioned in the lowest grade of Superintendents and one of the Probationerships was abolished. In 1904 the cadre consisted therefore of 32 Superintendents and four Probationers (including the Rangoon Town appointment). In view of the spread of cultivation, the increase in the Land Revenue and the growing responsibilities devolving on the Department proposals were made to raise the number of Probationers to five and to increase the cadre of Superintendents by two appointments, one to provide a superintendent for the charge of Revision and Extension Surveys and the other for the new post of Registrar, Rangoon Town. Further, owing to the fewness of the well-paid appointments, the slowness of promotion, and the fact that officers who had been transferred to the Department from the Survey of India were suffering a considerable pecuniary loss, a revision of the cadre was recommended. All these proposals were sanctioned, and as a result the superior establishment in 1905 consisted of the following appointments:—

Grade.	Pay. Rs.	No.
First	700	1
Second	600	2
Third	500	4
Fourth	400	5
Fifth	300	7
Sixth	250	7
Seventh	150—200	8
Probationers ...	100	5

6. *The reorganisation of* 1908.—The last reorganisation, which was undertaken in order to provide for leave vacancies and to ensure that the Department should continue to attract a suitable class of officers, took place in 1908 and is still in force.

(II) PRESENT CONSTITUTION.

7. The present constitution of the Department is given below:—

(*a*) *Composition of Establishment.*—The administrative officers in charge of the Department are a Commissioner assisted by a Deputy Director and Assistant Director. The Commissioner besides being in charge of the Land Records Department also controls the Settlement Department. This appointment ranks as a Divisional Commissionership and is reserved for an officer of the Burma Commission, who draws the pay of his rank plus an allowance of Rs. 500 provided his total emoluments do not exceed those of a Divisional Commissioner. The Deputy Director's duties are confined to the Land Records Department. The appointment is reserved for an officer of the Burma Commission. The Deputy Director is usually an Assistant Commissioner of some eight years' service, who draws the pay of his rank in the Commission plus an allowance of Rs. 200.

The Assistant Director is an officer of the Provincial Land Records Service. The pay of the appointment is Rs. 1,000.

The cadre of the Provincial Service includes the following posts in addition to the Assistant Directorship:—

No. of posts.	Grades.	Pay.
		Rs.
1	1st grade Superintendent	800
2	2nd grade Superintendents	700
3	3rd grade Superintendents	600
10	4th grade Superintendents	500
12	5th grade Superintendents	400
13	6th grade Superintendents	300
41		
3	1st grade Assistant Superintendents	250
3	2nd grade Assistant Superintendents	150—200
6		

This cadre provides one Superintendent for each of the thirty-four districts under Supplementary Survey, one for the charge of Special Survey

Operations and one for the charge of the Map Section of the Government Press.

The following special allowances are drawn in addition to their substantive pay by the officers holding certain posts:—

The Superintendent attached to the Government Press, local allowance ...	100
The Superintendent in charge of Rangoon Town Lands, local allowance	100
The Superintendent holding the office of the Registrar, Mandalay Town Lots, conveyance allowance	50
The Superintendent in charge of Rangoon Town Lands, conveyance allowance	60

(*b*) *Method of recruitment.*—The method of recruiting the administrative officers in charge of the Department has been given above. Up to 1893 Superintendents were recruited almost entirely from the Survey of India and these posts were in consequence filled by officers possessing a high degree of professional capacity. Since 1893 occasional vacancies have been filled by appointment from the Survey of India Department, but for the most part recruitment has been local. Young men are selected by the Local Government from a list of nominees submitted by the Commissioner of Settlements and Land Records, proficiency in mathematics being considered in making nominations. No candidate for nomination is ordinarily registered in the office of the Commissioner of Settlements and Land Records unless he has passed the I.A. or I.Sc. of an Indian Univerity, with mathematics as one of the subjects, or the European High School Pass examination (provided that the higher mathematics comprising algebra, geometry, trigonometry and logarithms are included in the subjects passed) or such other examination as may be declared to be equivalent. Besides possessing these educational qualifications, applicants for registration must:—

(i) Be natives of India as defined in article 37 of the Civil Service Regulations.

(ii) Be above the age of 18 years and not more than 25 years.

(iii) Produce a medical certificate of physical fitness signed by a Commissioned Officer of the Indian Medical Service.

(iv) Possess certificates of good moral character from responsible persons.

(v) Be unmarried and undertake not to marry before the expiry of the period of probation.

The nominees selected by the Local Government are gazetted as Assistant Superintendents on probation.

(*c*) *System of training and probation.*—The rules for the selection and training of Assistant Superintendents provide for a year's training in Cadastral and Traverse Surveying at the Survey of India Training School at Dehra Dun, to be followed by a year's training in field and office work with a Survey of India Topographical Party in Burma. On the completion of these two years' training the selected candidate is posted to duty under a Superintendent of Land Records to be trained for six months in the general work of the Department, at the end of which period, if the reports on his work are satisfactory, he is confirmed in his appointment in the Department.

(*d*) *Conditions of the Service in regard to* (*1*) *Salary.*—In the matter of pay the Land Records Department offers much the same inducements as the Provincial Executive and Excise Services. Superintendents of Land Records, Superintendents of Excise and Extra Assistant Commissioners are alike distributed in six grades, the salaries attached to which range in arithmetical progression between the extremes of Rs. 300 and Rs. 800. Each service throws open superior administrative appointments to members of the Department, there being one such opening in the Land Records and Excise Services, and five, though with a more numerous cadre, in the Provincial Executive Service. As compared with the Assistant Superintendents of the Excise Deparment the Land Records Assistant Superintendents are at some disadvantage, the former all drawing Rs. 250 on completion of training and Rs. 200 during the period of training; whereas 3 out of 6 of the latter draw pay at the rate of only Rs. 150—200.

(*2*) *Leave.*—The reorganisation of 1908 provided a leave reserve of 5 Superintendents or roughly 14 per cent. of the existing strength without drawing on Assistant Superintendents. The Indian Service Leave Rules, Chapter XIV of the Civil Service Regulations, apply to Superintendents.

(*3*) *Pension.*—The ordinary rules in Part IV, Civil Service Regulations, govern the pensions of Superintendents.

(*e*) *The employment of Burmans as Superintendents.*—Of 15 Superintendents and Probationers appointed by 1893, five were Burmans. In 1899, when the first reorganisation was sanctioned, out of 17 appointments 6 were held by Burmans. Since the reorganisation of 1908, 3 direct appointments to the ranks of Superintendents have been made by transfer from the Survey of India Department. All 3 of these officers were Anglo-Indians, as there were no Burman officers in the Survey of India Department. These direct appointments had to be made as the Department was undermanned and trained Survey officers were immediately required. Twelve appointments of Assistant Superintendents have also been made under the rules quoted in the previous paragraph. Of these 12 recruits, 2 are Burmans and a third is a Chino-Burman, the remaining 9 recruits being all Anglo-Indians, *i.e.*, Eurasians or Europeans domiciled in the country. Including this Chino-Burman there are at present 8 Burmans in the Service, their distribution being as follows:—

	Rs.
1 3rd grade Superintendent on... ...	600
2 4th grade Superintendents on... ...	500
1 5th grade Superintendent on	400
1 6th grade Superintendent on... ...	300
3 2nd grade Assistant Superintendents on	150—200
8 Total	

All appointments in the Provincial Service are open to Burmans, and in making promotions there is no discrimination between Burman officers and officers of other races. Appointments given to Burmans in recent years would probably have been more numerous but for the fact that it is not easy to get suitable Burman recruits with the requisite educational qualifications.

8. *The Subordinate Staff.*—The Subordinate staff consists of Inspectors and Revenue Surveyors.

Inspectors.—When the Department was constituted in 1892, there was in existence a staff of 36 Inspectors who assisted the officers seconded from the Survey of India Department in the supervision of the annual supplementary survey in Lower Burma. In 1892 sanction was accorded to the entertainment, gradually and as necessity arose, of 65 Inspectors in Lower Burma in five grades on pay ranging from Rs. 50 to Rs. 100. In 1899 the number in Lower Burma was raised to 73. In 1900 sanction was accorded by the Secretary of State to the appointment of 70 Inspectors in Upper Burma, in four grades with pay ranging from Rs. 50 to Rs. 80, and to the creation of additional posts, as occasion should require, in any part of the Province subject to a fixed limit of expenditure. New posts have been made under these Orders from time to time and in June, 1912, the number of Inspectors in the Province totalled 195. All of these are natives of Burma.

Revenue Surveyors.—Up to 1892 the responsibility for the upkeep of supplementary survey lay in Lower Burma with the *thugyis* (headmen) of the revenue circles into which each district was divided. They either did the work of survey themselves or employed trained assistants at their own expense. In 1892 the system of revenue collection by village headmen was initiated. This involved the gradual abolition of the circle *thugyis*—there are now only 103 left—and the transfer of their trained survey assistants to Government service. In Upper Burma revenue surveyors have always been the direct servants of Government. The number of surveyors employed by Government and

thugyis throughout the Province before 1902 is not now known; in that year the number who were Government servants was 1,058. In June, 1912, the number was 1,762 and in addition there were still 122 surveyors employed by the surveying circle *thugyis*. All alike are natives of Burma, as are the temporary chainmen who are engaged to assist them in the open season. There are various grades of surveyors on pay ranging from Rs. 20 to Rs. 45. Chainmen are paid Rs. 10 to Rs. 12.

APPENDIX II.

Supplementary Memorandum on the Land Records Department prepared by the Government of Burma.

1. *The present regulations as to recruitment, training and probation, and whether these regulations are satisfactory.*—The present regulations are stated in paragraph 7 of the General Memorandum of the 30th June, 1913. The regulations as to recruitment and probation have been found satisfactory, but the survey training scheme as originally devised has broken down. The Dehra Dun School is no longer available for the theoretical and practical preliminary training of the first year and the Survey of India Parties employed in Burma are not working under conditions suitable for the second year's training. In the circumstances the greater part of the survey training will have to be done by the department itself.

2. (*a*) *The rates of pay and allowances in force in* 1890 *and* 1900 *and at the present time.*—The information required under this heading is given in the following statement:—

2. (*b*) *Whether the present rates of pay and allowances are satisfactory.*—The pay and allowances drawn by Assistant Superintendents after their period of probation are satisfactory as are also the rules regulating the travelling allowance of Superintendents. But there is not a sufficient number of appointments in the higher grades of Superintendents to allow of a satisfactory flow of promotion. If it is decided to adopt a time-scale of pay for other departments a time-scale of Rs. 300—25—800 would be suitable for the Land Records Department.

3. *The number of posts in each grade and the provision, if any, made in the cadre for leave and training.*—The number of posts in each grade is set out in paragraph 7 of the General Memorandum. The total of 41 Superintendents includes a provision of five for leave and training.

Rates of Pay and allowances of Officers of the Land Records Department, Burma, in force in 1890 *and* 1900 *and at the present time.*

(1)	1890. Pay. (2)	1900. Pay. (3)	1913. Pay. (4)	Remarks. (5)
	Rs.	Rs.	Rs.	
Assistant Director of Land Records -	...	800—1,000	1,000	The Superintendent attached to the Government Press and the Superintendent in charge of Rangoon Town Lands each get Rs. 100 a month local allowance, while the latter is in receipt of a conveyance allowance of Rs. 60 per mensem in addition. The Superintendent holding the office of Registrar, Mandalay Town Lots, is in receipt of a conveyance allowance Rs. 50 per mensem.
Superintendents, 1st grade - -	600	700	800	
,, 2nd grade - -	500	600	700	
,, 3rd ,, - -	400	450	600	
,, 4th ,, - -	300	300	500	
,, 5th ,, - -	250	200	400	
,, 6th ,, - -	...	150	300	
Assistant Superintendents, 1st grade	...	100	250	
Assistant Superintendents, 2nd grade	...	...	150—200	

4. *What appointments outside the authorised cadre are held, temporarily or otherwise, by officers of the various Services.*—No appointments outside the authorised cadre are at present held, temporarily or otherwise, by any officers of the department. It is suggested that the listed post of Settlement Officer on Rs. 1,000 per mensem at present open only to members of the Provincial Civil Service should be given alternately to a Superintendent of Land Records and to a member of the Provincial Civil Service. The work in the Department is a good training for settlement work.

5. *Whether any addition is required to the present cadre.*—If the proposal that the listed post of Settlement Officer should be thrown open to the Department is accepted it will be necessary to add one appointment to the cadre as there would be practically continuous seconding of one Land Records Officer first under training as Assistant Settlement Officer and then as Settlement Officer.

APPENDIX III.

Statement of the Civil Appointments on Rs. 200 a Month and over held by Europeans, Anglo-Indians, and Indians, on the 1st April, 1913, in the Burma Land Record Department.

Pay.	Number of Employés in each Grade or Class.														
				Hindus (including Sikhs and Parsis).

APPENDIX IV.

Officials who furnished written evidence to the Royal Commission in connection with their Enquiry into the Burma Land Records Department but who were not orally examined.

I.—Précis of the opinions of the Officers of the Land Records Department of Burma, viz:—

A. P. P. L'Estrange, Esq., B.A., Superintendent of Land Records, Myingyan, and 30 other Officers of the Department.

INDEX.

(The numbers refer to paragraphs.)

Burma Land Records Department.

A

Administrative Staff, *Haddock* and *Pe Maung* 71051, 71053

Age Limits (*see under* Recruitment).

Allowances (*see* Pay).

Anglo-Indians, civil appointments on Rs. 200 a month and over held by, 1st April, 1913... p. 438

Assistant Director of Land Records:
Appointment by selection from superintendents advocated, *Haddock* and *Pe Maung* ... 71047
Chosen from superintendents, *Haddock* and *Pe Maung* 71051
should be Eligible for extra pension after three years, *Haddock* and *Pe Maung* 71049
Ineligible for special allowances received by Deputy-Director, *Haddock* and *Pe Maung* 71047
PAY:
1890, 1900, 1913 ... ... p. 437
Rates, *Haddock* and *Pe Maung* ... 71051, 71053
proposed Scale, *Haddock* and *Pe Maung* 71047, 71075
should be Required to take part in work of all sections of office, *Haddock* and *Pe Maung* 71051
Title should be changed to Second Assistant Commissioner, *Haddock* and *Pe Maung*... 71051

Assistant Superintendents:
Marriage should be forbidden, *Haddock* and *Pe Maung* 71046
Pay, proposed scale, *Haddock* and *Pe Maung* 71047
Probation grade, pay and inadequacy of, *Haddock* 71056

B

Buddhists, civil appointments on Rs. 200 a month and over held by, 1st April, 1913 ... ... p. 438

Burma Allowance (*see under* Pay).

Burmans:
Employment as superintendents ... ... p. 436
Number in service and laying down of proportion not advocated, *Haddock* 71057
One-sixth of appointments held by, and one-fourth advocated, *Haddock* and *Pe Maung* 71050
every Opportunity to enter department, and system approved, *Pe Maung* 71057

C

Cadre, no appointments outside authorised, held by officers of department ... ... p. 437

Civil Appointments on Rs. 200 a month and over held by Europeans, Anglo-Indians, and Indians, 1st April, 1913 ... ... p. 438

Commissioner of Settlements and Land Records:
Pay 71051
Post held by senior officer of Burma Commission 71051

Constitution, history and growth of department p. 435–6

D

Deputy Director of Land Records:
Land Records officer should be eligible, *Haddock* and *Pe Maung* 71046
Local Allowance, *Haddock* and *Pe Maung* ... 71051

Deputy Director of Land Records—*continued.*
Post held by junior officer of Burma Commission, *Haddock* and *Pe Maung* 71051
Post usually retained for two years only, *Haddock* and *Pe Maung* 71051
should be Required to take part in work of all sections of office, *Haddock* and *Pe Maung* 71051
Title should be changed to First Assistant Commissioner, *Haddock* and *Pe Maung* ... 71051

E

Europeans, civil appointments on Rs. 200 a month and over held by, 1st April, 1913 ... p. 438

Exchange Compensation Allowance (*see under* Pay).

F

Furlough (*see under* Leave).

G

Government of Burma, memorandum p. 435–7

H

Haddock, J., evidence of 71044–71075

House Allowance (*see under* Pay).

I

Imperial Service, distinction between Provincial Service and, abolition advocated 71050

Inspectors of Land Records:
Burmans, two Assistant Superintendentships should be thrown open to, to induce better men to join, *Haddock* and *Pe Maung* ... 71075
Position of, etc. ... ... p. 436

L

Leave:
with Allowances, taken in India, should count as service, *Haddock* and *Pe Maung* ... 71048
Conditions ... ... p. 436
FURLOUGH:
Commutation of portion on full pay desired, *Haddock* 71063
Commutation to shorter period with higher allowance should be allowed, *Haddock* and *Pe Maung* 71048
after First eight years, and thereafter after every seven years advocated, *Haddock* and *Pe Maung* 71048
at more Frequent intervals desired, *Haddock* 71065
Provincial Services, period between furloughs should be four years, *Haddock* and *Pe Maung* 71048
Privilege, suggestion *re* accumulation, *Haddock* and *Pe Maung* 71048
Reserve, inadequate, and increase advocated, *Haddock* and *Pe Maung* 71046
RULES:
Admission to benefit of European Service rules of officers drawing not less than Rs. 800 requested, *Haddock* and *Pe Maung* 71075
One set for all services in India advocated, *Haddock* 71062

M

Marriage:
PROHIBITION WITHIN FIRST FIVE YEARS, IF TIME-SCALE ESTABLISHED:
Advocated, *Haddock* 71070
not Advocated, *Pe Maung* 71070
Rule that candidates should be unmarried and not marry during probation, no reason for, as regards Burmans, but not objected to, *Pe Maung* 71069

Maung Pe Maung, K.S.M., evidence of 71044–71075

Medical Attendance, free, or reduced, to families of officers, suggestion, *Haddock* 71047

P

Pay:
BURMA ALLOWANCE:
Grant to Land Records officer if given to officers of any other department whether or not specially recruited for Provinces advocated, *Haddock* and *Pe Maung* 71046
not so much Wanted by officers as extra pay to meet high cost of living, *Haddock* ... 71061
Conditions ... ... p. 436
Exchange Compensation Allowance, abolition in all services, or grant to Land Records Department advocated, *Haddock* and *Pe Maung* 71046, 71073
HOUSE ALLOWANCE:
Advocated to officers where drawn by other Departments, not only to those classed as "Imperial," *Haddock* and *Pe Maung* ... 71046
Need for, *Haddock* 71072
Local Allowance, recommendation *re* extended grant of, *Haddock* and *Pe Maung* ... 71046
Officers on same footing as Extra Assistant Commissioners, and advantages as to pay, etc., extended to latter should apply to, *Haddock* and *Pe Maung* 71046
Officiating allowances between grades would not be required if time-scale adopted, *Haddock* 71060
Rates of pay and allowances, 1890, 1900, 1913 p. 437
Scale, *Haddock* 71053
Travelling allowance, all Gazetted officers should be classed as Class I. for, and Rates proposed, *Haddock* and *Pe Maung* 71046

Pension:
Conditions ... ... p. 436
Exchange, two shillings to rupee advocated, *Haddock* and *Pe Maung* 71049
Service for, should count from 18, *Haddock* and *Pe Maung* 71049
(*see also* Retirement.)

Probation and Training:
Scheme, *Haddock* 71056
Survey training scheme, breakdown of, as originally devised ... ... p. 437
System ... ... p. 436
System satisfactory, *Haddock* and *Pe Maung* 71045

Promotion:
Small number of high posts open to Land Records officers compared with Civil Service, and recommendation, *Haddock* and *Pe Maung* 71046

TIME-SCALE:
Advocated, *Haddock* and *Pe Maung* ... 71058
Scheme, *Haddock* and *Pe Maung* 71047

Provident Fund, joining of, not compulsory, *Haddock* 71066

R

Recruitment;
AGE LIMITS:
20–25 advocated, *Haddock* 71055
21–25 advocated, *Pe Maung* 71055
Candidates, register kept, no advertisements issued, *Haddock* 71071
no special Difficulty, *Haddock* 71071
should be Open to domiciled Europeans and Anglo-Indians and Burmans of good family as now, *Haddock* and *Pe Maung* ... 71050, 71057
Regulations considered satisfactory by Government ... ... p. 437
Rules suitable, *Haddock* and *Pe Maung* ... 71044
on Standard educational qualification, *Haddock* 71067
System ... ... p. 436
Vacancies, three, only, last year, *Haddock* ... 71071
no Vacancy probably for two years, *Pe Maung* 71071

Reorganisations of Department ... ... p. 435

Retirement:
Compulsory, at 55 advocated, *Haddock* and *Pe Maung* 71049, 71059
after 25 years' service should be allowed, *Haddock* and *Pe Maung* 71049, 71064

Revenue:
position of Surveyor, etc. ... ... p. 436–7
work of Department, interchangeability of officers, *Haddock* 71068

S

Settlement Department, work of, interchangeability of officers, *Haddock* 71054, 71068

Settlement Officers:
Assistant, two appointments should be open to Superintendents, *Haddock* and *Pe Maung* 71046
Listed post, giving of, alternately to Superintendent of Land Records and member of Provincial Civil Service suggested ... ... p. 437
One appointment should be open to Superintendents, *Haddock* and *Pe Maung* 71046

Superintendents:
Assistant (*see that title*).
Officiating appointments should be permitted if grade system retained, *Haddock* and *Pe Maung* 71046
PAY AND ALLOWANCES:
1890, 1900, 1913 ... ... p. 437
proposed Scale, *Haddock* and *Pe Maung* 71047
Relations with District Officers, *Haddock* and *Pe Maung* 71051

Survey Department, work of, *Haddock* ... 71054

T

Training (*see* Probation and Training).

Travelling Allowance (*see under* Pay).

W

Work of Officers of Department, their competency for certain duties, *Haddock* 71054, 71068

ROYAL COMMISSION ON THE PUBLIC SERVICES IN INDIA.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

ON THE

PUBLIC SERVICES IN INDIA

RELATING TO THE

PUBLIC WORKS DEPARTMENT

At Delhi, Friday, 14th November, 1913.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

THE EARL OF RONALDSHAY, M.P.
SIR MURRAY HAMMICK, K.C.S.I., C.I.E.
SIR THEODORE MORISON, K.C.I.E.
MAHADEV BHASKAR CHAUBAL, ESQ., C.S.I.
ABDUR RAHIM, ESQ.
WALTER CULLEY MADGE, ESQ., C.I.E.
FRANK GEORGE SLY, ESQ., C.S.I.
JAMES RAMSAY MACDONALD, ESQ., M.P.

R. R. SCOTT, ESQ. (*Joint Secretary*).

W. M. GRIFFITH, ESQ., Executive Engineer, United Provinces.

Written Statement relating to the Public Works Department.

71,244. **(I.) Methods of Recruitment.**—Of the numerous Engineers recruited by the Secretary of State under covenant to the Public Works Department there are, it is believed, only 5 men, named below, now remaining in the Public Works Service, who have not been placed on the Imperial cadre, and it is on behalf of these men that this representation is made. Their names and dates of appointment are as follows:—

Name.	Degrees, &c.	Appointed in	Service as		Total service about	Present Province.
			Covenanted Engineer from	Temporary Engineer from		
					Years.	
Griffith, W. M.	A.M.I.C.E.	Nov. 1902.	Jan. 1903.	Feb. 1908.	11	United Provinces.
Milner, H. W.	B.Sc., A.M.I.C.E.	Do.	1903	1908	11	Madras.
O'Reilly, J. J.	B.A., B.E.	Do.	1903	1908	11	,,
Dixon, T. I.	B.E., M.I.C.E.	Nov. 1903.	Jan. 1904.	Jan. 1909	10	Punjab.
Colyer, C. A.	A.M.I.C.E.	Do.	Do.	Do.	10	,,

All these 5 Engineers were recruited by the Secretary of State (under a 5 years' covenant to the Public Works Department) prior to the abolition of the Royal Indian College of Engineering and the commencement of direct recruitment to the Imperial cadre by the Secretary of State in 1905, and so, at that time, could not be appointed by the Secretary of State direct to the Imperial cadre. They were recruited by advertisement in the open market and selection by interview as are the present recruits to the Imperial cadre, but the qualifications required in their case were rather more exacting than those of the present recruits to the Imperial cadre, as they were required to have in addition to a college training 2 years' experience in practical work. The age-limit was in consequence 28 years instead of as at present 24 years (*i.e.*, 4 years higher) and the pay of the appointments was proportionately greater.

At the time of their recruitment hopes were held out to them by senior officials at the India Office, Whitehall, that if their services were approved they could be given appointments in the Imperial cadre, and these Engineers have since forfeited their return passages to England and remained as temporary Engineers in India in the hopes of these prospects being fulfilled.

All these Engineers have now approximately 10 or 11 years' approved service in the Public Works Department, and it is believed that *all* have been recommended by the Local Government under whom they are serving for places on the Imperial cadre.

71,245. **(III.) Conditions of Service and (V.) Conditions of Leave.**—The present conditions of service of these Engineers as Temporary Engineers are quite unsuitable for men recruited in England by the Secretary of State who are not natives of India or men domiciled in India and their present position is an impossible one because—

(*a*) They are not under the European leave rules, and are not entitled to furlough to enable them to proceed to England to recruit their healths, and see their relations after a period of service in India.

(*b*) They are not entitled to a pension.

(*c*) They are debarred from the higher appointments, in fact Mr. W. B. Gordon, the late Secretary to the Government of India, Public Works Depart-

(779—3.) Wt. L3490/12. 2300. 6/15. D & S.

ment, in an interview at Simla in August 1911 personally informed Mr. Griffith who will give evidence before you that it was the intention of the Government of India gradually to reduce the temporary Engineers to Sub-Divisional (*i.e.*, the most Junior Assistants) charges as sufficient Engineers of the permanent establishment were recruited, to fill the executive appointments.

(*d*) They are liable to have their appointments terminated at a month's notice.

71,246. **(IV.) Conditions of Salary.**—(*a*) Their pay is inferior to the pay and allowances of the Imperial Engineers who were recruited by the Secretary of State after they were, though these Imperial Engineers are at least 4 or 5 years younger (being recruited under a 4 years' lower age limit) and are no better qualified.

(*b*) Their pay is inferior to the pay and allowances of numerous covenant Engineers recruited in the same years and under the same conditions as themselves who have been transferred to the Imperial cadre.

(*c*) Their pay is even inferior to the pay and allowances of covenant Engineers recruited several years after they were who have been transferred to the Imperial cadre although they have been holding more senior positions for longer periods than these Engineers or than the Imperial Engineers above referred to in sub-paragraph (*a*).

As example take the case of Mr. Griffith who in his 11th year of service is only drawing the same pay (*i.e.*, R700) as he was in his 5th year of service, although for the last 5 years he has held charge as Executive Engineer of one of the more important irrigation divisions of the United Provinces, and his work in that Division has for several years been favourably mentioned in the Annual Administration Reports of the United Provinces Irrigation Branch His pay is in fact less than the most junior grade of the Imperial Executive Engineers

71,247. *General.*—The grievances of these Engineers is that—

(1) The Supreme Government, although having already created a precedent by appointing a number of covenant Engineers to the Imperial cadre, refused the recommendations of their Local Governments to appoint these Engineers to the Imperial cadre although these recommendations were believed to be as strong as others, and in one case (Mr. Griffith) to have been submitted 3 times by the Local Government.

(2) That whilst refusing these recommendations of their Local Governments the Supreme Government accepted those of a further 12 covenant Engineers who have since (in 1911) been transferred to the Imperial cadre though these 12 men were (*a*) all junior in service, (*b*) In some cases not so well qualified, and (*c*) In some cases not so well recommended.

The refusal of the Supreme Government to accept the recommendation of the Local Governments on behalf of these Engineers has placed them in a very serious position because they are all well qualified Engineers who 10 or 11 years ago gave up good prospects in England to serve in India. Had they not done so they might by now have reasonably expected to have established good positions in England for themselves. As now situated their 10 or 11 years' service (the most important years in their professional careers) as Irrigation Engineers will be of no value to them professionally in England where no similar work exists and further they have by now *lost all their professional connections in England.*

These Engineers find themselves in this serious position through no fault of their own, because:—

(1) They are fully qualified for the Imperial cadre.

(2) Their services have been fully approved as shown by their being recommended by the Local Government for the Imperial cadre.

(3) They were initially misled at the time of their recruitment in England by having hopes of the Permanent cadre held out to them.

(4) They were misled by the precedent created by the Government of India in transferring a number of covenant Engineers to the Imperial cadre.

(5) In one case, namely Mr. Griffith, it is admitted in writing by Mr. N. F. McLeod the then Chief Engineer and Secretary to Government, Public Works Department, Irrigation Branch, United Provinces, that he led Mr. Griffith to believe he would assuredly receive a permanent appointment.

It is suggested that the placing of these 5 ex-covenant Engineers in the Imperial cadre could easily be arranged by regulating recruitment, and it is further suggested that the placing of these men in the Imperial cadre in places which their age and length of service would entitle them, would improve this cadre, by making it more regular and strengthening it in places where it requires strengthening.

It is hoped that this Royal Commission after due consideration of these facts will recommend His Majesty's Government to place these 5 Engineers in similar positions in the Imperial cadre to those already given to other ex-covenant Engineers, recruited at the same time and under the same conditions as themselves, and so save the threatened ruin of their professional careers.

Mr. W. M. GRIFFITH called and examined.

71,248. (*Chairman.*) The witness said he held the post of temporary Executive Engineer, and appeared on behalf of five engineers who came out originally to India under covenant before the present system of appointment by selection was instituted. He arrived in India on the 1st January 1903. Twelve engineers of his year came out to India under similar conditions, and he appeared before the Committee on behalf of three of them. Of the remainder, two had been made permanent in Madras, one had been made permanent in Bombay, and the others he had not traced, but probably they had all been made permanent.

71,249. He could not state the reason why he and his colleagues had not been absorbed into the Service; that had been a problem he had been trying to solve for the last six years. Of those who had been incorporated in the Service, some were of the same year as himself, some were senior and some were junior. When the last junior men were incorporated, the Government of India refused the recommendation made on his behalf, on the ground that he did not belong to that year, but one man had been made permanent whose covenant had expired in the same year as his own.

71,250. At the time of his appointment, hopes were held out to him of being absorbed in the permanent staff. There was nothing in writing, but on enquiry being made at the India Office as to what were the prospects, he was given to understand that he would probably be taken into the permanent cadre if his services proved satisfactory. He believed it had been admitted by the Government of India that there were some grounds for that belief. In the case of one man it was pointed out that it was a practical certainty he would be made permanent, and the question of his probable pension was officially looked into at the India Office.

71,251. Just prior to the lapse of witness's covenant, he went to see the Secretary to the Government of India, Sir Lionel Jacob, when he learnt that he was not to be taken into the permanent cadre in Madras. In that respect it was quite possible that, as there were five covenanted engineers in his year in Madras, Government did not see its way at that time to take all five in. He therefore left Madras, and accepted an appointment in the United Provinces on the understanding from the Secretary of the Local Government that, if his services were approved, he would in all probability be made permanent. At a later period he understood from the Secretary of the Local Government that he was to be made permanent and he then married. He had, however, not been made permanent and Mr. McLeod had kindly written a letter, which he desired to read to the Committee, because Mr. McLeod felt the very awkward position in which he had placed him. The letter was dated 13th October, and was as follows: "My dear Griffith: In February 1907 you came to see me at Lucknow, seeking for an appointment in the Irrigation Branch in these Provinces. You asked what prospects there were of permanent employment in the Imperial

Engineer Service in the event of your being offered, and accepting, an appointment as temporary Engineer. You informed me at the same time that you had seen Mr. (now Sir) Lionel Jacob, at Calcutta, and understood from him that there were prospects of your obtaining permanent employ in the Public Works Department, but that such permanent appointment would depend on the recommendations of the Local Government under whom you might take service. I told you that I personally considered that there appeared to be a good chance of your obtaining a permanent appointment in the Imperial Service in the Irrigation Branch in these Provinces, provided that you gave satisfaction and that your service was fully approved in the temporary appointment we were at that time able to offer you. Your work in this Province has been fully approved, and I personally always considered that in view of your service here, and your previous approved service as an Engineer under covenant in Madras, your prospects of obtaining permanent employ were better than those of the other officers recommended, and that you would assuredly be appointed to the Imperial Engineer Service. The orders of the Government of India, rejecting the recommendations of the Local Government on your behalf, have caused me extreme regret, the more so that they have so completely vitiated the personal assurance I had, and the belief I doubtless conveyed to you, of an assured permanent apointment in the Irrigation Branch in these Provinces." He had obtained a recommendation from the Madras Government, and his three colleagues also received recommendation for good services from their Local Governments.

71,252. He had first filled the post of Sub-divisional officer, and for the last five years he had been Executive Engineer, Divisional officer, but he had not been receiving for the latter period the pay of an Executive Engineer of the Imperial cadre. His salary was Rs. 100 less than that paid to the most junior executive officer of the Imperial cadre.

71,253. He was not on a scale of salary. The maximum he could look to under present circumstances was Rs. 700 a month. When first entering the service he began at Rs. 500, and finished at Rs. 700.*

71,254. He desired, with his colleagues, to be incorporated in the Imperial Service, but he would not be prepared to enter at the bottom of the list. He was not aware that the absorption of a certain number of engineers similar to himself had caused a good deal of dissatisfaction in the service. The scale was an incremental scale, and he did not see how it could affect anybody.

71,255. The grounds on which he claimed to be admitted into the service were, first the promise that at the end of his covenant he might be admitted; second that his service had been equal in every way to those engineers recruited at the same time as himself, and who had been taken into the Imperial cadre; third, that unless he was admitted his career was wrecked, because he was too old to begin again in another branch of the profession. If he were admitted to the Imperial Service he considered the whole of his temporary service should count for pension. He asked for equal treatment to those who were recruited at the same time and under the same conditions as himself.

71,256. He had not been able to afford to subscribe to the General Provident Fund. He had the opportunity of doing so, and about three months ago had been compelled to do so.

71,257. (*Sir Murray Hammick.*) He was quite sure his two colleagues, Mr. Milner and Mr. Riley, had not been confirmed. He did not know what pay they were drawing. They were still in the executive establishment of the Madras Public Works.

71,258. *He did not know at the time he made his application in England that it was the case with regard to other Departments of the Public Service that men were brought out under five years' agreements and then generally confirmed and put into the Service.*

71,259. (*Mr. Madge.*) *It would have been much wiser for him to have obtained some written statement at the time of his application instead of merely a verbal one.*

71,260. With regard to his objection to going in at the bottom of the list if made permanent he would point out that the pay of the lowest Imperial officer was Rs. 380 a month, against his present salary of Rs. 700.

71,261. His statement that junior Imperial engineers were no better qualified than the five temporary engineers he represented, was based on the qualifications of his five colleagues. Three of them were Bachelors of Science, and the other two were Associate Members of the Institution of Civil Engineers, which, as a theoretical qualification, was the standard of the Imperial Engineers recruitment. Also they had had at least two years' experience of works in England. Such a training had been insisted upon in their case, but it was not insisted upon in the case of the present Imperial engineers.

71,262. (*Mr. Chaubal.*) It would be in the power of the Secretary of State to transfer him to the Imperial cadre. The Government of India recommended, and the Secretary of State approved, and then the Government of India undertook the transfer. No representation had yet been made by him to the Secretary of State. He knew nothing of what his colleagues had done in the matter. He memorialised the Government on the 1st July 1912, and received an answer on the 13th May 1913 to the effect: "it is now found that this question is one which is beset with serious difficulties, especially in the case of the Imperial Service, in which the actual number of officers is already in excess of the existing strength, and any increase in the latter is very unlikely." He would like to mention that since that letter was written, 22 further Imperial engineers had been appointed, and in a recent copy of the *Statesman* it was stated that the Government of India had decided as a provisional arrangement to recruit 30 probationary engineers for the Imperial Public Works next year.

71,263. The Secretary of State would have the power to put him at once in the cadre on a salary of Rs. 700.

71,264. (*Sir Theodore Morison.*) If he were put into the cadre on this salary, he did not see how that would damage† the prospects of the Assistant En-

* Mr. Griffith afterwards wrote that he had received an intimation that his rate of pay from the 1st January 1914 was to be Rs. 800 *per mensem*, *i.e.*, an increase of Rs. 100.

† Mr. Griffith afterwards submitted an addendum in support of his opinion that putting himself and his colleagues into upper places in the cadre would not damage the prospects of junior men by creating a block. He wrote as follows:—

"(1) In the last 10 or 15 years the Public Works Department has considerably expanded and the expansion is believed to be *permanent* and likely to continue still further.

"(2) This expansion has resulted in the formation of a number of New Divisions and in additional higher administrative appointments.

"(3) The present cadre is badly under strength and the shortage is in the *senior* and not in the junior years.

"(4) The placing of men of corresponding age in these senior years is the only way in which the cadre can now be brought to its proper strength without resulting in subsequent irregularities and blocks.

"(5) The placing of senior men in the senior years of shortage would not create a block as they being older would retire sooner than junior men recruited now at the bottom.

"(6) The existence of the shortage is proved by the recent sanction of an increase of 42 Engineers to the strength of the cadre and by Mr. Russell's statement before the Commission that a further 10 per cent. on the cadre (say 80 men) was required.

"(7) The Imperial recruitment having been based on a calculation of *giving each recruit Divisional charge after 9 years*, it is clear these new Divisional charges *should* have been allowed for in recruitment 9 years before they were created. *It* follows therefore that the shortage must exist in *all* the senior years which were recruited before these new charges were created or thought of and *not* in the junior years.

"(8) To recruit this shortage, 42 + 80 = 122 men, entirely from the bottom, even if recruitment were spread over 10 years, would require an additional recruitment of 12·2 men above the normal, *i.e.*, an over recruitment of over 30 per cent. for 10 *consecutive* years. The effect of this would obviously be to create a *very serious block*.

"(9) To maintain the cadre correctly the rate of *retirement* needs as careful regulation as recruitment which could only be assured if these new recruits in the senior years were neither *older* nor *younger* than the men of the years in which they were placed."

gineers below him, whereas, it would mean ruin* to him if he were not transferred on equal terms with other men of his year recruited under the same conditions as himself, who had already been transferred to the Imperial cadre. If the Government advanced the argument that a certain number of engineers were brought out on covenant, the best of whom they would make permanent and reject the others, he agreed that although some of the officiating engineers, under whom the latter men had directly served, might not agree with that view, the final decision rested with the Government of India, but he submitted that he and his colleagues were not inferior, and that their qualifications were in many cases superior.

71,265. (*Lord Ronaldshay.*) The witness believed the twelve covenanted engineers who were junior to him, but who were incorporated in the permanent cadre, had just completed their covenant when they were incorporated and were drawing Rs. 600 a month. They came into the incremental scale at about the same rate.

(The witness withdrew.)

At Delhi, Monday, 17th November 1913.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

SIR MURRAY HAMMICK, K.C.S.I., C.I.E.
SIR THEODORE MORISON, K.C.I.E.
SIR VALENTINE CHIROL.
MAHADEV BHASKAR CHAUBAL, ESQ., C.S.I.
ABDUR RAHIM, ESQ.
GOPAL KRISHNA GOKHALE, ESQ., C.I.E.
WALTER CULLEY MADGE, ESQ., C.I.E.
FRANK GEORGE SLY, ESQ., C.S.I.
HERBERT ALBERT LAURENS FISHER, ESQ.
JAMES RAMSAY MACDONALD, ESQ., M.P.

And the following Assistant Commissioners:—

W. P. HOUSDEN, ESQ., Superintending Engineer, United Provinces.
E. W. CLARKE, ESQ., Executive Engineer, United Provinces.
D. W. AIKMAN, ESQ., Superintending Engineer, Punjab.
J. W. B. LOUGHRAN, ESQ., Executive Engineer, Punjab.

R. R. SCOTT, ESQ. (*Joint Secretary*).

R. P. RUSSELL, ESQ., Secretary to the Government of India in the Public Works Department.

Written Statement relating to the Public Works Department.

N.B.—*The opinions expressed in this memorandum are purely personal and are in no way those of the Government of India.*

71,266. **General.**—(1) *Organization of Department.*—For purposes of organization, each Province is split up into Circles, Divisions, and Sub-Divisions; in some Provinces these are called Divisions, Districts and Sub-Divisions:—

(i) *Administrative charges*:—

(*a*) All Public Works in a Province are in the charge of a Chief Engineer; in some Provinces there are separate Chief Engineers for the Buildings and Roads and Irrigation Branches.

(*b*) Circles of Superintendence—
These are in charge of Superintending Engineers. A Circle usually contains 3 or more Divisions.

(ii) *Executive charges*:—

(*a*) Divisional charges—
These are in charge of Executive Engineers and occasionally in charge of Temporary Engineers. A Division usually contains 3 or more Sub-Divisions.

(*b*) Sub-Divisional charges—
These are in charge of Assistant Engineers, Temporary Engineers, and Upper Subordinates.

(2) *Engineer Establishment.*—The Engineer Establishment of the Public Works Department is composed of—

(*i*) An *Imperial* Establishment consisting of—

(*a*) Civil Engineers appointed by the Secretary of State in England.

(*b*) A limited number of Royal Engineer Officers.

---

* Mr. Griffith afterwards submitted the following explanation. He wrote:—

"My reasons for claiming that failure to transfer me on equal terms would mean ruin are:—

"(1) *Financial.*—My present pay *is not* and for the past 5 years in which I have held Executive charge *has not been* sufficient to maintain *that position.* The actual pay I have drawn throughout my service and the positions held are given below.

Year.	Pay per mensem in Rs.	Positions held.	REMARKS.
1903	500	Sub-Divisional Office ..	Under 5 years Covenant in Madras.
1904	500	Ditto ..	
1905	550	Ditto ..	
1906	600	Ditto ..	
1907	700	Ditto ..	
1908	600	Sub-Divisional Officer to October then Executive.	Temporary Engineer, United Provinces.
1909	600	Executive Engineer in Divisional charge.	
1910	600	Ditto ..	
1911	600	Ditto ..	
1912	700	Ditto ..	
1913	700	Ditto ..	

In consequence instead of contributing to a provident fund I have actually been drawing out those small savings which in my earlier service I was able to accumulate, and am in consequence now without resources.

I have placed myself in this position in the belief: (*a*) That eventually justice would be done by the Government of India, when I hoped this loss would be adjusted. (*b*) In the confidence of my ability to eventually prove my worth. (*c*) In the knowledge of the repeated representations which were being made on my behalf by the Government of the United Provinces.

In justification I submit this belief has been shared by others in high authority better able than I to judge such matters.

Also to the fact that for the past 4 *consecutive* years my name has received special mention in the published Annual Irrigation Administrative Reports of the United Provinces as a result of the effect of my administration of the Rohilkhand canals.

(2) *Professional.*—Placing an officer in the Public Works Department cadre below the position of men of his *age* would mean that not only throughout his service would he draw inferior pay to his brother officers, but forcible retirement at 55 years would prevent the possibility of his rising to the higher administrative appointments. To an ambitious officer this would mean professional ruin.

(*ii*) A *Provincial* Establishment consisting of—

(*a*) Civil Engineers appointed from the Indian Engineering Colleges.

(*b*) Promoted Upper Subordinates.

Although the Engineer Establishment of the Department mainly consists of an Imperial and Provincial Service as above, for reasons which are explained in paragraphs 7-11, there exists—

(*iii*) An Establishment of Temporary Engineers recruited locally in India who belong to neither (*i*) nor (*ii*).

(3) *Strength of Establishment how determined.*—The strength of the Department (Imperial and Provincial Service) is based upon the number of constituted *superior posts, viz.*, Administrative and Divisional charges. The number of officers required to fill the total number of superior posts is determined from actuarial tables drawn up with reference to the conditions of service. The rate of annual recruitment to maintain the total strength is similarly calculated. The cadre number and rate of annual recruitment is so determined as to ensure as far as possible that an Assistant Engineer will rise to Executive rank and be in charge of a Division after ten years' service.

At present the question of fixing the cadre strength of the entire Department is before the Secretary of State. The cadre proposed by the Government of India has been based upon a total number of 440 *superior posts, viz.*:—

Public Works Department	344
State Railways	96
Total	440

The 344 superior posts in the Public Works Department are made up of:—

Imperial Service posts	241
Provincial Service posts	103
Total	344

The 96 superior posts in the State Railways Department are made up of:—

Imperial Service posts	66
Provincial Service posts	30
Total	96

The number of men required to man 241 *Imperial* posts in the Public Works Department and 66 in the Railway Department is 509 and 139 respectively, or a total of 648. The number of men required to man 103 *Provincial* posts in the Public Works Department and 30 in the Railway Department is 219 and 61 respectively, or a total of 280. The total cadre of the Public Works Department including the Railway Branch is therefore 928. The proportion of Imperial posts is therefore nearly seven-tenths and of Provincial posts is nearly three-tenths of the total.

In addition to the strength of 928 officers a provision has been made of 60 officers to enable the Government of India to comply with requests from Foreign employers and Railway Companies for the services of Government Engineers.

The number of Provincial Service Engineers has been fixed by the Secretary of State at present at 280.

(4) *Actual strength compared with cadre.*—The actual strength of the Department on October 1st, 1913, including officers on deputation was as under:—

Imperial Service.

—	Public Works Department.	Railways.	Total.
(*a*) Civil Engineers	559	118	677
(*b*) Royal Engineers	30	40	70
Total	589	158	747
Provincial Service.			
Civil Engineers...	183	26	209
Grand Total	772	184	956

(5) *Majority of Sub-Divisional charges must devolve upon Upper Subordinates.*—The general result of calculating the cadre strength in the manner described is of importance. If the number of officers required to fill the administrative appointments is deducted, the balance consists of Executive Engineers, Assistant Engineers in practically equal proportions, after excluding the leave reserve, that is to say, the number of officers theoretically on duty of not more than 10 years' service is approximately equal to the number of officers theoretically on duty of more than 10 years' service excluding those holding administrative charges. It has already been pointed out that an average Division contains about 3 Sub-Divisions. A Division is the charge of an Executive Engineer; as the number of Assistant Engineers, that is, officers of not more than 10 years' service is supposed to be equal approximately to the number of Executive Engineers, it follows that in theory there is only one Assistant Engineer available for sub-divisional charge in each division. In practice, however, the number of Assistant Engineers available to hold charge of Sub-Divisions will not admit of even one sub-division in every division being held by officers of this rank. The bulk of the Sub-Divisional charges must therefore be held by Upper Subordinates.

(6) *The Sub-Divisional Officer.*—The Sub-Divisional Officer, is the officer primarily responsible for the actual carrying out of work through the medium of his subordinates. He is the officer who is primarily responsible for making all the arrangements, supervising and passing work, arranging contracts, settling rates, measuring up work, preparing bills for payment, and to a very large extent paying for work done. He has a drawing account and prepares all initial accounts. He is the officer who is primarily responsible for the expenditure of a very large amount of public funds. Although the accounts of the Sub-Divisional Officer are subject to strict scrutiny and, after compilation in the Executive Engineer's Office, to audit, and although the work of the Sub-Divisional Officer is inspected by the Executive Engineer, nevertheless upon the capability and integrity of the Sub-Divisional Officer to a very large extent depends the return for expenditure incurred. In a large number of cases, the work of a Sub-Divisional Officer employed upon *maintenance* does not call for any high engineering skill, but it is mostly in such cases where the responsibility of obtaining a fair return for outlay is the most difficult and the least susceptible of any check or control. Slackness and want of efficient control over subordinates, contractors, or Departmental labour, means waste of public funds.

(7) *Reluctance to employ Upper Subordinates as Sub-Divisional Officers cause of employing Temporary Engineers.*—For long past, there has been a great reluctance on the part of the officers responsible for the administration to place any but senior, qualified and selected Upper Subordinates in charge of these responsible positions of trust, particularly in the case of Canal Sub-Divisions. As the number of such selected Upper Subordinates has been found insufficient to man the number of Sub-Divisions recourse has been had to the employment of Temporary Engineers. Temporary Engineers are for the most part Engineers who have received an Engineering education at an Indian College, but who failed to obtain a guaranteed appointment. There are among them Europeans domiciled in India, Eurasians, Indians, and a few men originally appointed in England by the Secretary of State on covenant, who took up appointments on the expiry of their covenants.

(8) *Temporary Engineers. Conditions of service.*—Temporary Engineers are on the footing of monthly paid servants; they are appointed by local Governments for periods of a year; their services are renewed annually if required; their services can be terminated on a month's notice on either side; their pay is governed by no rules; they usually receive increases of salary every second year if recommended; they are non-pensionable; they are entitled to the ordinary rules regarding privilege leave; they are not entitled to furlough or sick leave, except as an act of grace; their pay usually varies from Rs. 250

per mensem to Rs. 750 per mensem; as a rule, an officer on the latter rate of pay will have had 20 or more years' service in the Department, or be from 40 to 45 years of age. Temporary Engineers with but few exceptions are employed as Sub-Divisional Officers and have very little prospect of ever being employed in a higher capacity. In consequence of their having been relegated to this position for so long many of the present Temporary Engineers are unlikely to be fitted for more responsible positions.

(9) *Temporary Engineers to large extent permanently employed.*—It should be clearly understood that in those Provinces in which they are most largely employed Temporary Engineers are engaged not so much with the object of forming an elastic element to meet the fluctuating operations of the Department, as for the purpose of eking out the permanent establishment, because the Department, as organised, requires a greater number of qualified Upper Subordinates for positions of trust than can be obtained from the Upper Subordinate Establishment as it exists. The necessity for this extra establishment of Temporary Engineers sandwiched between the Upper Subordinate and the permanent staff of Engineers would to a large extent disappear if the Upper Subordinate Establishment were sufficiently attractive to induce a greater number of men of better class, family and position to enter it.

(10) *Difficulties of dispensing with services of Temporary Engineers.*—As now constituted, it is impossible to increase the proportion of Assistant Engineers to the Executive Engineers without blocking the former for Divisional charges. On the other hand, it is increasingly difficult to obtain good qualified Temporary Engineers to serve under existing conditions. The longer a Temporary Engineer serves, the more difficult does it become to dispense with his services and to cast him adrift with, in most cases, but little prospect of other employment, owing to his having become stale, less active and efficient than he was, by reason of having been relegated to a position from which he has little chance of being promoted. Moreover, the work of maintaining canals, regulating the supply of water and looking after its distribution, of attending to the record of irrigation and to duties generally falling under the category of up-keep and maintenance, though of the first importance, does not need the possession of qualities and experience that are in any demand outside Government service.

(11) *Growth of size of Divisional charges.*—The necessity for the creation of the present service of Temporary Engineers has, apart from that already given, been accentuated by another cause, *viz.*, that the number of the Divisonal charges has by no means kept pace with the growth of operations of the Department. In many cases the Divisional charge has become unwieldy, the Sub-Divisions have increased in number, size and importance; as the number of Assistant Engineers is directly based upon the number of Divisions there are less Assistant Engineers now available for Sub-Divisional charges: on the other hand the Sub-Divisional charge being larger and more important is less suitable as a Subordinate's charge.

Twenty years ago the Engineer cadre of the Public Works Department (excluding Railways) consisted of 581 officers; the outlay per annum was about 4½ crores. In 1911-12 the cadre stood at 705 officers and the outlay had increased to 11½ crores; thus while expenditure has increased by 150 per cent., the Establishment has only increased by 21 per cent. Twenty years ago there were in the United Provinces 24 Divisional charges with an annual outlay of about 58 lakhs. At the present time there are 36 Divisional charges to cope with an annual expenditure of 130 lakhs; thus while expenditure has increased to 2¼ times what it was the Divisional charges have only increased 50 per cent. In the Irrigation Branch, Punjab, 20 years ago there were 18 Divisions and an annual expenditure of 64 lakhs. In 1912-13, there were including the North-West Frontier Province 41 Divisions to cope with an outlay of 258 lakhs; while expenditure has been quadrupled, the number of Divisional charges has only been slightly more than doubled. In the Buildings and Roads Branch of the same Province while the expenditure has risen from 31 lakhs per annum to 70, the number of Divisions has in the same time only been increased from 10 to 13.

(12) *Divisional Officer's control over initial expenditure.*—The work that devolves upon the Divisional Officer by this increase of work leaves him less free to move about his charge and pay that personal attention to initial outlay which is so important when so large an expenditure of public funds is initially entrusted to officers of the Subordinate class. No system of audit, check, or paper control on the part of the Executive Engineer can take the place of personal supervision. An increase in the number of Divisions and a reduction in their size will automatically provide more Assistant Engineers for Sub-Divisional charge and is a move which, in my opinion, is urgently called for. Nevertheless the only true solution of the present difficulty appears to me to lie in the direction of improving the conditions of the Upper Subordinate Establishment or the method of recruitment so as to secure more men of the better class to enter it to man these important Sub-Divisional charges. An improvement in pay and conditions will not, I am afraid, alone effect this object without introducing some system of nomination as well, at any rate for some time to come. If a sufficiency of capable and thoroughly trustworthy Upper Subordinates could be obtained, the necessity for the employment of Temporary Engineers would largely disappear.

(13) *Suggested improvements in conditions of service of Temporary Engineers.*—Until such time as more men qualified in every way for Sub-Divisional charge can be obtained from the Upper Subordinate establishment, the continued entertainment of a body of Temporary Engineers seems to be unavoidable, and, this being so, these Engineers should be placed on a better footing. It is practically certain that a number of Temporary Engineers who have considerable service, 20 years and more, as Sub-Divisional Officers, cannot continue to be efficient Sub-Divisional Officers much longer, the activity and keenness required of youth cannot be expected from men of advancing age, it is equally certain that appointments as Divisional Officers cannot be provided for them except at the expense of the claims of men in the Permanent Service. It has also to be considered that the salary of a Temporary Engineer might reasonbly expect to receive on the basis of length of service if efficient is more than is warranted to an officer in Sub-Divisional charge. To improve the service I would suggest that Temporary Engineers might be engaged on short agreements of 3 or 5 years on stated terms as to pay after an initial period of probation, that they come under the Indian Service rules as regards furlough and that on being discharged they receive a bonus equal to one month's salary for each year of completed service. I would suggest some such rules being made applicable to Temporary Engineers now in employ.

(14) *Inadequate provision of staff for works under construction, and necessity for considering future demands in advance.*—The establishment of the Public Works Department is subject to much more violent fluctuations than the establishments in other departments. The completion of any large Canal Project for example necessitates the employment of a large staff to work it. The Secretary of State has laid down the principle that the permanent staff should be regulated by the ascertained requirements of the service for the discharge of the duties which may certainly be reckoned upon as recurrent year by year, irrespective of any new large undertakings provision for which should be made when necessary by the employment of temporary establishment. This principle has generally been held to preclude the taking into consideration of posts which, although not immediately necessary, can with certainty be foreseen as being permanently required a few years hence. Any increase to a cadre by the normal method of recruitment can only be obtained very slowly and I think it would be advantageous to commence recruitment for future certain requirements as soon as they become manifest. For example, the Secretary of State sanctions a new Canal Project which is estimated to take 10 years to complete. The construction may involve the creation of 12 or more "superior posts" which as long as construction is in hand are deemed

temporary appointments and as such are excluded from the superior posts on which the cadre is calculated. From the moment of commencement it can be foreseen with sufficient accuracy that within 10 years the new work will involve say 8 permanently required "superior posts": for the purposes of recruitment these posts should be taken into consideration as tending towards obtaining the establishment required by the time it is wanted and lessening the necessity of departing from normal recruitment to make up for deficiencies which usually tends to interfere with an even flow of promotion. In order to ensure that the establishment is maintained at a strength which is sufficient to meet actual requirements of work the cadre should be examined and revised if necessary more frequently than it is at present.

The present system is altogether too rigid to meet the requirements of a Department liable to the sudden fluctuations caused by sanctions to large Projects absorbing a large number of officers. A new Canal Project may readily require for many years 30, 40 or more officers for construction purposes. In order to provide this establishment the practice is to withdraw a number of selected permanent Executive and Assistant Engineers from their regular charges and to employ Temporary Engineers to the extent necessary to make up the full number of men required, the places of the permanent officers so withdrawn being taken by Temporary Engineers, Permanent Upper Subordinates (frequently of a grade too low for their charges) and Temporary Upper Subordinates.

In view of the large amount of constructional work always going on and likely to continue for many years, it would probably be safe to augment the superior posts on which the cadre is based by 10 per cent. to provide for the constructional programme. On the Triple Canal Project in the Punjab there are at the present time 56 officers employed, viz., 31 belonging to the Permanent Establishment and 25 Temporary, the former to a large extent abstracted from works in operation.

Briefly put, the construction of new works, under the existing conditions, is carried out largely at the expense of the efficiency of the arrangements required to administer works already constructed, and is thoroughly uneconomical. The apparent saving in Permanent Establishment which is susceptible of some calculation is far more than counterbalanced by the waste that cannot be calculated but which is known to occur and cannot but occur by the employment of an establishment to a large extent inefficient and unreliable on the upkeep of works. It cannot be too strongly insisted upon that the opportunities for scamping work, waste or fraud on construction work, carried out on estimates which can generally be prepared with close accuracy are almost negligible, compared with the work of lesser importance perhaps from a purely engineering aspect, but involving in the aggregate far greater outlay which is dependent for economical results very largely upon the capability and integrity of the officers employed in immediate charge.

71,267. (I.) **Methods of Recruitment.**—*Imperial Service.*—The number of recruits required annually is determined with reference to the sanctioned strength and is based, as already stated, upon actuarial calculations. The normal rate of recruitment is occasionally modified to make up for abnormal deficiences. Intimation is given to the Secretary of State of the number of recruits required each year. This intimation is given by the Government of India annually in November. The Secretary of State is supplied in May of the following year with a detail of the distribution by Provinces. The distribution of the annual number of recruits among the various Provinces is roughly determined *pro rata* according to the existing deficiences in each.

Generally the present method of recruitment, which has been adopted by the Secretary of State since the abolition of the Royal Indian Engineering College at Cooper's Hill, has been satisfactory as far as technical qualifications are concerned. Under the existing system some very excellent men have been sent out, many of them in no way inferior in technical knowledge to the best of the Cooper's Hill Engineers. The selection Committee have not, however, always paid quite as much attention as is desirable in selecting candidates with the requisite social status for service in India where this important consideration should not be ignored. The Indian is quite capable of detecting any marked inferiority in social status in the officer under whom he is serving, and where such exists his respect diminishes. The general standard of education as apart from technical education is probably not as high now as it was in the days of Cooper's Hill when most of the men entering that institution came from the Public Schools. I consider that the Selection Comittee should be represented by at least 50 per cent. of senior officers in the Department on the active or retired lists, in the latter case by men who have not been severed from the Department too long. These are the men who know the requirements best.

While recognising the arguments that can be brought forward in favour of the abolition of the Royal Engineering College at Cooper's Hill, there is a widespread feeling that the *esprit de corps* which the training at that College fostered and the spirit and qualities that it engendered throughout the service—which under present arrangements must largely disappear—involves the loss of an asset both to the Department and to the State of great value.

The Provincial Service is recruited from the students of the Indian Engineering Colleges, and by the promotion of selected Upper Subordinates. The present rate of recruitment to maintain a strength of 280 is 14 annually, viz., 9 and 10 students and 5 and 4 Upper Subordinates in alternate years. The distribution of the appointments is laid down in the Public Works Department Code, Volume 1, paragraph 149. The system of appointing the qualified students from the Thomason College at Rurki to the lists directly under the Government of India is detailed in paragraph 151 of the same Volume.

The training afforded at the Indian Colleges is directed to the requirements of India and is generally satisfactory. The average Indian College recruit is less highly trained than the average recruit appointed from England; on the other hand his knowledge of the language, people, and methods adopted in India render him more useful for his first year or two. The institution of the Provincial Service does not attract to the Indian Colleges the class of men that formerly went to them. The fact that Engineer officers and subordinates are trained together at the same institution is not very satisfactory, it would be preferable if the training of the two classes could be entirely separated and provided for by separate institutions.

71,268. (II.) **System of Training and Probation.**—*Imperial Service.*—The recruits appointed to the service by the Secretary of State have undergone as a rule at least a year's practical training on works in England. I do not consider any further training or probationary period in India is necessary. The Selection Committee have had ample opportunity of seeing and finding out all about a candidate before they recommend him to the Secretary of State for appointment. If a candidate were liable after spending two years' probationary period in India to be discharged as unsuitable and sent home again, this insecurity of appointment would, in my opinion, operate as a bar to the best men coming forward. I am not aware of any Imperial Service where appointments are made under such conditions.

A further objection to my mind consists in the difficulty of giving practical effect to a probationary period of service having any very real value. The exigencies of the service render it most difficult to secure that a probationer shall serve even for one year under one officer and that period is too short. The number of officers of sufficient standing who would be likely to take any real interest in a probationer, or whose verdict could be relied upon, or who would have the opportunity of keeping him under his eye is very few. As a rule the utmost that would result would be that the probationer would be attached to some Assistant Engineer in charge of a Subdivision and the report would be submitted by the Executive Engineer upon mostly second-hand information. Few Executive Engineers would have any opportunity of usefully employing a probationer immediately under them. Many would not have the time to pay very much attention to them. A probationer sent home after two years as unsuited for

the Indian Service would find it difficult to secure an opening at a critical age in his career. In every Government service there must be some bad bargains and no system of probation which is practicable will obviate this. The present system under which the recruit is usually employed at Headquarters for a time and then attached to a Sub-divisional Officer to pick up the language and ways of the country until he is capable of managing a Sub-divisional charge of his own answers well enough; it is not as a rule in the first two years that a man's worth makes itself apparent amidst surroundings entirely new to him.

Provincial Service.—Passed Engineer students from Rurki College are required to undergo a year's training on works which is at the same time a probationary period as an Apprentice. (The recruit for the Imperial Service has already gone through a period of training before he has been selected.) It is desirable that this period of probation should be retained. Indian students have less facility for applying the theory they have learned to practice than Europeans, and before being appointed as Assistant Engineers, it is desirable that Government should have an opportunity of judging how they are likely to turn out.

71,269. (III.) **Conditions of Service.**—*Imperial and Provincial Services.*—The rule requiring the retirement of an officer from the service on attaining the age of 55 years should be made absolute. The suspension of this rule for a period of 5 years has caused the gravest discontent throughout the entire service. Although the number of officers actually granted extensions of service was relatively small, the number of officers whose prospects and emoluments were seriously effected was large—the result was seriously to reduce the pensions of certain officers below what they had every prospect of receiving had the operation of the rule not been suspended. No officer affected in this way received any compensation. It would be difficult, if not impossible, to calculate the monetary loss sustained by loss in promotion sustained by five officers at least for every extension of service granted, but I think that the officers whose pensions have been affected could be determined and that the loss should be made good to them.

The rule which provides for the compulsory retirement of an officer who on attaining the age of 50 years has not been recommended for advancement to administrative rank should be more rigidly enforced.

Owing to the comparatively small number of higher appointments in the Department I think that the system of selection as opposed to mere seniority should play a greater part in making promotions to the administrative grades. The principle is already laid down in the Public Works Department Code, Volume I, paragraph 80, but is usually only very partially carried out.

71,270. (IV.) **Conditions of Salary.**—*Imperial Service.*—The scale was last revised in 1908 when an incremental system instead of a graded scale was introduced: the benefit of the new scale was, however, discounted by the fact that exchange compensation was at the same time abolished. Even under the improved conditions it is doubtful if the improvement in salaries has been commensurate with the increased cost of living in India. Under the reorganization scheme of 1908 an officer who is qualified to hold charge of a Division cannot draw a salary of more than Rs. 800 per month, viz., that due to him on completion of 10 years' service unless he is actually holding such a charge. I consider that this restriction should be removed as it is through no fault of his own, if through errors in recruiting, or paucity of Divisional charges, that an officer cannot be provided with a suitable charge after 10 years' service.

There are at present two grades of Chief Engineer. Chief Engineers who are Secretaries to local Governments or local Administrations are entitled to a local allowance of Rs. 250, and 150 respectively. The salaries of Chief Engineers are:—Chief Engineer 2nd class Rs. 2,500, Chief Engineer 1st class Rs. 2,750. The anomaly frequently arises that a Chief Engineer in a local Administration receives less emoluments than a Chief Engineer junior to him under a local Government. Owing to the fact that all Chief Engineers do practically the same work, and have the same responsibilities, and that the total number of Chief Engineers in the whole of India is small I consider that the separation of the Chief Engineers into two classes should be abolished. Under present conditions the majority of Chief Engineers are unable to reach the 1st class until immediately before they have to retire and a large number are unable to reach that class at all. To remove these anomalies and objections I consider that there should only be one class of Chief Engineer and all should be paid the same, viz., Rs. 3,000 per-mensem and that the local allowances should be abolished; considering the fact that Chief Engineers are invariably selected men of not usually less than 28 to 30 years' service this salary is not too high. In this connection I may point out that Commissioners of Divisions are not divided into grades; in each Province there are a number ,of Commissioners whereas there are only about 16 Chief Engineers in the Public Works Department all over India.

The present salary of the Secretary to the Government of India in the Public Works Department is Rs. 3,500. I consider that the duties and responsibilities attaching to the appointment warrant it being placed on the same footing as the Secretaryships to the Government of India in the Home, Finance, and Commerce and Industry Departments. A Secretary in the Public Works Department is always an officer of from 6 to 10 years' longer service than any other Secretary. Unlike other Secretaries who are generally drawn from a grade lower than that of a Commissioner of a Division, the Secretary to the Government of India in the Public Works Department is invariably drawn from the highest grade in his own Department. Having regard to the additional cost of living in Simla, the additional emoluments of only Rs. 500 per mensem more than those drawn by a Chief Engineer, 1st class, are insufficient to render the Secretary financially better off than a Chief Engineer of a Province. In all the cases cited the additional emoluments are far greater. For these reasons I think the salary of the appointment might reasonably be raised to Rs. 4,000 as in the case of the appointments referred to.

Provincial Service.—It has been contended that because officers of the Provincial and Imperial Service of the same standing perform approximately the same duties they should be treated similarly in all respects as regards salary. I entirely dissent from that view. The Provincial Service has been created to provide an opening for Indians desirous of entering the Department of Public Works; the salary, conditions of leave, pension, &c., have therefore to be framed to suit the conditions of Indians or others whose domicile is India, and bear no relation to the Imperial Service which provides for an establishment whose domicile is for the most part England. The conditions regarding salary, leave, pension, &c., require to be fixed so in each case as to attract the class of person required, upon entirely independent grounds. The present salaries in the Provincial Service—subject to the removal of the restriction which prevents an officer from rising to more than Rs. 535 per mensem unless in charge of a Division—seem to be suitable enough.

71,271. (V.) **Conditions of Leave.**—*Privilege Leave*—Under existing rules, privilege leave allowances are contingent upon a return to duty—Civil Service Regulations, Article 264. In the case of combined leave the privilege leave allowances are not contingent upon a return to duty; an officer on combined leave at the end of his service can therefore without penalty retire at the end of it. I am of opinion that, in so much as privilege leave is leave already earned, the restriction contained in the Civil Service Regulations referred to above should be relaxed.

Under existing rules an officer can only accumulate 3 months' privilege leave; it occasionally happens that when an officer has accumulated 3 months' privilege leave, the exigencies of the public service render it impossible to grant the leave applied for; in such cases I think that, although the existing limit of 3 months' privilege leave at one time as maximum should be adhered to, the balance of the privilege leave earned should be placed at the credit of the officer concerned, seeing that he was debarred from taking it through no fault of his own.

Study leave.—As a general rule an officer in the Public Works Department desirous of improving his knowledge by visiting works out of India to study the more up-to-date methods of construction or design can only do so during his leave and if recommended by his local Government. Such an officer is required to furnish a report to the Secretary of State and is allowed his actual travelling allowance by rail. This allowance is insufficient to recoup an officer for his incidental expenses in connection with his tour of inspection when on furlough pay. I consider that an officer in such cases should be treated more liberally by being placed *on deputation*.

Furlough.—There is a wide-spread feeling throughout the entire department that the rules regarding furlough pay are so inadequate as to preclude many officers from taking furlough earned; in cases of sickness even, a rest from work or ordinary furlough can only be taken at the expense of running into debt. The present rules provide for furlough being taken on half pay with no minimum (except as provided in Article 320 of the Civil Service Regulations), and with a maximum of £200 per quarter. In the case of officers of the Indian Civil Service and of Military officers subject to the Civil leave rules, the furlough allowances paid at the Home Treasury are subject to a minimum of £500 per annum or last salary drawn, whichever is less. A Civil Engineer of the Imperial Service who takes furlough after completing 8 years' service receives as furlough pay, £279 per annum as a maximum. Even after 18 years' service his furlough pay falls short of that which a Military Officer subject to the Civil leave rules can draw after 8 years' service. It is not in the interests of Government that its servants should be compelled to forego furlough because they cannot afford to take it, or that they should become embarrassed if they are forced to take it. Numbers of instances can be cited of officers in the Public Works Department who have been unable to take furlough on this account. It is presumed that in fixing a minimum of £500 per annum or last salary drawn for furlough allowances, Government had in view the cost to an officer of maintaining himself in England in the state of comfort he was entitled to expect during a period of rest, and if so there wauld appear to be no valid reason why one Imperial Service should be accorded treatment so much less favourable than another. I consider that the furlough rates of pay should be so fixed as to render it possible for an officer to take furlough without financial embarrassment; and this at present junior officers cannot do. The propriety of extending to the Public Works Department the rules regulating furlough allowances in the case of members of the Indian Civil Service and Military Officers in Civil employ is suggested for the consideration of the Commission, both as regards the maximum and minimum.

It has been suggested that the rule which precludes an officer from taking ordinary furlough for a period of 3 years since return from last furlongh exceeding three months' duration, might be modified so as to allow of an officer taking furlough if due to him at any time when his services can be spared. It frequently happens that an officer wishes to take ordinary furlough and can be spared, but is prevented from doing so by the rule quoted (Civil Service Regulations, Article 308).

71,272. **(VI.) Conditions of Pensions.** — *Retiring pensions.*—The inadequacy of the retiring pensions has been a standing grievance in the Department for the last 30 years. The history of the case appears to indicate without any doubt that when the retiring pension was originally fixed at Rs. 5,000 after completion of 25 years' service, it was assumed that this amount should be, as in fact it was, the equivalent of £500. In the earlier prospectuses of the Royal Indian Engineering College the pension was by a footnote so equated. Owing to the great fall in exchange when the rupee fell to little more than a shilling, the rate of exchange for pension was minimised in 1890 to 1*s.* 9*d.* The present ordinary pension converted at 1*s.* 9*d.* per rupee is equivalent to £437 10*s.* 0*d.* It has for years been contended that owing to the increased cost of living this pension fixed more than half a century ago is entirely inadequate to enable an officer to live in England with any approach to the standard of comfort to which he has been accustomed or which his social standing entitles him to expect to be able to provide for himself and his family in his old age. Many memorials in which practically the whole department have participated, have been addressed to the Secretary of State on this subject during the last 6 years, but no reply has been received to them, except to the effect that, as the question will come within the scope of the Commission's enquiry, no action can be taken pending their recommendations. It is therefore to the Royal Commission that the department looks for a full enquiry into this standing grievance. Owing to the fact that for one reason or another neither the Government of India nor the Secretary of State has been able to give any reply to the large number of memorials that have been submitted since 1907-08, it is considered that in equity any amelioration that it may be decided to make should be held to apply to those officers who in the meantime have been compelled to retire.

The rules governing the pensions of Imperial Service Engineers are contained in Civil Service Regulations, Chapter XXX. These rules were introduced to improve the pensions which were formerly governed by Chapter XIX and although the proportion of average emoluments constituting the pension was raised very considerably for service up to 20 years, the effect has been to reduce the actual amount of pension in nearly all cases by reason of the lowering of the maximum amount of the pensions. The fact that the salaries have been raised considerably since these rules were introduced, it is believed in 1884,. renders the maximum pensions that can be claimed still more disproportionate to average emoluments than formerly. Under present rules the maximum ordinary pension is only sixteen-sixtieths of average emoluments after a service of 22 years, and about ten-sixtieths of average emoluments after a service of 30 years. In other services the maximum pension much more closely approaches the half of average emoluments.

It is considered that the maximum pensions ordinarily obtainable by Imperial Service Engineers should not be less than that of officers of the Indian Army, Indian Medical Service, and Military officers in Civil employ, *viz.*, £700 after 30 years' service, and that the following scale of pensions might reasonably be conceded, *viz.*, (*a*) after 25 years' service £500 if paid in England or Rs. 5,000 if paid in India; and (*b*) after 30 years' service £700 if paid in England or Rs. 7,000 if paid in India.

Special pensions:—

(*a*) After 3 years' approved service as a Superintending Engineer £100 if paid in England or Rs. 1,000 if paid in India.

(*b*) After 3 years' approved service as a Chief Engineer £100 if paid in England, or Rs. 1,000 if paid in India; that a proportionate amount of (*a*) and (*b*) be granted for service of less than 3 years. The number of administrative appointments in the Public Works Department is small and it seems equitable that if an officer through no fault of his own should be unable to serve for the full period of 3 years as a Superintending Engineer or a Chief Engineer he should be entitled to a proportionate share of the additional pension according to the service rendered.

Invalid pensions.—In 1884 a new scale of Invalid Pensions was introduced under which officers of the Imperial Service of the Public Works Department, although entitled to a much higher percentage of average emoluments as an invalid pension, actually received less by reason of the maximum permissible being reduced. For example, an officer under the old rules (Article 474, C.S.R.) after 12 years' service was entitled to twelve-sixtieths of average emoluments which has been calculated to be Rs. 1,920 subject to a maximum of Rs. 2,400. Under the new rule (Article 641, C.S.R.) the same officer is entitled to twenty-two-sixtieths calculated to be Rs. 3,520 subject to a maximum of Rs. 1,800. Similarly an officer after 19 years' service under the old rules was entitled to nineteen-sixtieths with a maximum limit of Rs. 3,800. Under the new rules the same officer although entitled to twenty-nine-sixtieths is limited to a maximum of Rs. 3,000 only.

As the increase in the percentages introduced by the rules of 1884, Article 641, C.S.R., can have no other meaning but that the new rules were intended to improve the conditions, it is considered that the maximum limits should be increased to what they were before and which still govern all other services coming under the operation of Article 474.

71,273. (VII.) **Such Limitations as may exist in the Employment of Non-Europeans and the Working of the Existing Division of Services into Imperial and Provincial.**—In paragraph 71266 (2) it has already been shown that the present strength of the Provincial Engineer Establishment, which is in the process of being worked up to, is based upon 133 superior posts out of a total number in the Public Works Department including Railways of 440—or a ratio of seven-tenths Imperial and three-tenths Provincial. I am of opinion that, although there are doubtless many exceptions, as a rule Indian Engineers are more wanting in originality, less capable of applying book knowledge to practice, less reliable where forethought has to be exercised, have less initiative and are less suited for the positions of responsibility calling for prompt action than Europeans: in the control of Subordinate Establishments they are generally weaker and are apt to be swayed by considerations of caste and creed. The Indian Engineer usually does better under European direction than when left to himself, especially where confronted with difficulties. As a general rule he is far better at construction than design, but in construction he is apt to leave the dealing with difficulties too much to subordinates and contractors. Further, unless fully instructed in every detail, his want of attention to minor details and want of taste results in a lower standard of finish. On the other hand his knowledge of the country, the people and the language, often render him less dependable than the European upon his subordinates in making arrangements for carrying out work. In many cases he can carry out work under conditions that would be very difficult for a European. I am doubtful if it would be wise to increase the relative proportions of Provincial Service Engineers to Imperial for some time to come or to increase the existing limit of 10 per cent. in the case of Indians appointed to the Imperial Service by the Secretary of State. The increase should come in time but the process must be gradual and dependent upon the exhibition of those qualities in which, as compared with the European, the Indian Engineer as a rule is at present lacking.

71,274. (VIII.) **Relations with other Services.**—I have no remarks to enter under this head: the relations of the Public Works Department with other Services are satisfactory on the whole.

Mr. R. P. Russell called and examined.

71,275. (*Chairman.*) The witness said he had occupied his present position as Secretary to the Government of India in the Public Works Department for about eight months.

71,276. With reference to the question of recruitment from Royal Engineer Officers, the witness explained that the Department had to employ a number of these officers as a war reserve, but he advocated the employment of Royal Engineers both on Railways and Public Works, provided that they were in an equality with the Imperial Service Officers and started at the bottom of the list. If a Royal Engineer of fourteen years' service was suddenly transferred to the Public Works Department he interfered with promotion and this caused a good deal of natural discontent. Royal Engineers were posted to a Province and there was no rule by which certain of them were employed on Irrigation and others on buildings and roads. Generally they preferred buildings and roads, and if it could be so arranged they were given employment in that branch. Their number was limited to 70, of whom 40 went to Railways and 30 to Public Works.

71,277. With reference to recruitment in England, the witness considered that social status was requisite in the Public Works Officer but not more so than in any other officer. If a system of open competition was introduced followed by a course of training in a College on the Cooper's Hill model, he thought it would tend to rub off the angles and to raise the men of humbler social status to an equality with the others. Competition combined with nomination would be the best system if it could be worked; and although he did not think it would be easy he thought it could be worked. He valued an English training very highly indeed, as the training an Engineer received in England and the opportunities afforded to him for seeing works were considerably more valuable than they were in India. This applied more to Railway work than to Irrigation, as Irrigation was not practised in England and the practical part of the work had to be learnt in India. The training, however, which a man required in order to deal with hydraulic problems was of a higher order as a rule than the training for other branches of Engineering, and even in the case of an Irrigation Officer English Engineering practice stood a man in better stead. The foundation teaching was better in England than could be obtained in Indian colleges.

71,278. The witness was against the Indian Engineer going to England and being appointed by the Secretary of State to the Imperial Service. He should be encouraged to go to England to get a better training, but in the Imperial Service as now constituted salary and leave and furlough rules were based on the assumption that the service would be manned by Engineers whose domicile was England, and he did not see why a man who was domiciled in India should come in under the same conditions. He advocated something in the nature of a foreign service allowance for the European Officer, as it was necessary, in order to attract a European, to offer considerably higher terms than were offered to Indians, whose cost of living was not comparable with that of Europeans.

71,279. He would like to see Indian Officers recruited and trained in India, and if that were done and the Europeans recruited in England had a standard of salary higher than that of the indigenous community he thought the Service would be contented and satisfied, but not as it at present existed. He did not think the argument of the Provincial Service that they were not paid the same as the Imperial Service was an argument that should be listened to; it was a natural claim and it was foreseen from the outset that the time would come when men would ask for equal pay for doing the same duties. He was prepared to lay down the principle that a European, in consideration of an English domicile and loss of amenities, must be paid at a higher rate than the domiciled officer.

71,280. The witness said he had asked many Indians whether their grievance was non-equality of pay and he had met no Indian yet who admitted that that was the grievance. The average Indian appeared to recognise that it was reasonable to pay a European Officer recruited in England a different rate of salary from the Indian living in his own country.

71,281. The witness was of opinion that the Engineering Courses at the Colleges in India were satisfactory, but he did not like the system under which Provincial Officers and Subordinates were trained in the same college. Candidates for the superior Service should be sent to Rurki and those for the subordinate Service to the other Colleges. The concentration in one College of all the Provincial Service classes would probably result in the best training available. He added, however, that the prospects in the Public Works Department did not attract the higher classes of Indians to the same extent as they were attracted to the Provincial Civil Service.

71,282. In the period of ten years from 1903 to 1913 the recruitment figures were as follows: From Cooper's Hill 98, including 3 Indians (none since 1907); by Nomination of Secretary of State 257, including 5 Indians; Royal Engineers 35; Temporary Engineers 15 (none since 1909); Covenanted Engineers 32 (none since 1911).

71,283. With regard to the present proportion of vacancies reserved for promoted officers from the

subordinate Service, the witness said that personally he considered too many Upper Subordinates were now promoted into the Provincial Service, and he would rather see an increase in the number of officers trained in Rurki for the Provincial Service and a reduction in the number of promoted subordinates. It was desirable to reward the particularly good and able subordinate, but it was only the exceptional upper subordinate who made a good officer.

71,284. As to maintaining the distinction between the Imperial and Provincial Branches, the witness said that in practice there were no Imperial and Provincial Divisions. Provincial Engineers were eligible for so many Divisions, but a Division which was of no importance to-day might be a very important one three years hence. There was no earmarking of Divisions for Provincial and Imperial officers they were all on one list, doing the same work. He would prefer to retain the existing titles Imperial and Provincial, although the responsibilities and prospects were the same in both branches. The general character of the Department would be lowered if the promoted Upper Subordinate was called a Civil Engineer with the same status as an Imperial Engineer. The main ground for retaining the Provincial Service was that an Upper Subordinate was from time to time promoted into it, and therefore the service should not rank with the Imeperial.

71,285. With reference to the statement that had been made to the commission that the proportion of Indian trained Engineers, who had risen to Executive rank was larger than the proportion of trained English Engineers, the witness said possibly that was so, but the statement applied to the Imperial Rurki trained men who had entered the department before the creation of the Provincial Service, and it would not apply to the Provincial Service officers. The men who were attracted to Rurki when recruitment was direct to the Imperial Service were better than the men who now entered the Provincial Service. He admitted that this was hardly an argument in favour of retaining the Provincial title.*

71,286. The witness suggested an increase of cadre to the extent of 10 per cent. to meet the requirements of construction, the 10 per cent. being over and above the figures given in his written statement. The present cadre made no allowance, except in a very indirect way, for the officers who were required for the constructional programme. The recent proposals for increasing the cadre had been put forward mainly with the object of obtaining the Secretary of State's sanction to a new method of calculating the cadre, and the increase asked for was almost entirely due to the readjustment of Provinces, the splitting up of Bihar and Orissa and Bengal; the net increase was very small. The Government of India had already agreed to an increase of 5%, and they were merely awaiting the sanction of the Secretary of State.

71,287. The main reason for employing Temporary Engineers was the difficulty of finding a sufficient number of upper subordinates qualified for permanent posts; there was an actual deficiency of permanent men. He realized the great difficulty of employing Temporary Engineers on a *quasi*-permanent basis. He was inclined to think it would be better if upper subordinates could be obtained of the class required for sub-divisional charges. As to how such a class could be obtained, the witness said the only system he could suggest was nomination. The subordinate Civil Service was recruited mainly by nomination of men of good family, and the Public Works Department would require to have something of the same kind. For the higher sub-divisional work a certain education was necessary. He suggested the officers selected for this higher work should be sent to Rurki with the prospect of getting sub-divisional charges if they qualified. It should not be left to competition. If the method he suggested was carried out, Temporary Engineers could be restricted to temporary jobs. Even with an addition of 10 per cent. for construction purposes there would always be a margin because the additional 10 per cent. or 90 officers would not suffice to carry out all the construction programme. The number of administrative posts would have to be increased in order to provide for the increased numbers of Assistant Engineers. When construction works were undertaken there would be usually an increase in administrative appointments even if only on a temporary basis. It would be necessary, of course, to guard against a block, but he did not think there would be any real danger of a block.

71,288. The witness said he should like to remove the charge bar at Rs. 800 in all cases where an officer had qualified for appointment to the executive grades. He thought it would militate against recruitment to have two incremental scales, one for Assistants and one for Executive Engineers, with promotion from one to the other by selection. Under existing rules a man did not necessarily obtain a division after he had completed his career as an Assistant Engineer; he had to be qualified. That power of excluding the unfit was a form of selection; but a man had to be very bad before he was prevented from rising to executive rank. It would be reasonable, the witness considered, to pay a Temporary Engineer more than an officer of corresponding rank in the Provincial or Imperial service in consideration of the fact that he was employed on a non-pensionable basis.

71,289. The reserves for leave and training were adequate. Many officers often failed to take the long leave to which they were entitled because they could not offord to take it on the authorised rate of leave allowance. The present dissatisfaction in regard to leave allowances might be met to some extent by allowing officers to commute a certain proportion of their furlough into full pay leave, but a concession of this character would hardly be in accordance with the spirit of the furlough rules, and he would not like to commit himself to a definite opinion off-hand.

71,290. As to retirement after twenty or twenty-five years' service, the witness said there had been very few retirements after twenty years' service, but no difficulty was put in the way of anyone who desired to go. If better terms were offered in the way of pension he would favour the abolition of optional retirements after twenty years' service. In his judgment twenty years was rather too short a term of service to qualify an officer for retirement.

71,291. As to the complaint that officers were freely given extensions beyond fifty-five years of age, the witness said there had been a demand on the part of officers to remain in the service after that age but it had been definitely decided that no extensions were to be given. For five years the rule as to retirement at 55 had been in abeyance with the result that a limited number of men were benefited at the expense of a very large number.

71,292. The witness was in favour of the establishment of a Family Pension Fund for the Public Works Department and he thought there was a general desire for it. It should be in lieu of the Provident Fund, as he did not think the average man could afford to join both. The average proportion of salary contributed to the General Provident Fund by officers might be taken as 10 per cent., but it was possible to subscribe 12½ per cent. He was in favour of permitting Temporary Engineers to subscribe to the Provident Fund and he was under the impression that they were allowed to do so now.

71,293. (*Sir Murray Hammick.*) The witness said his experience of other parts of India was not sufficient to enable him to decide whether there were objections to making Rurki an All-India College for the Provincial Service. The men who now came into the Provincial Service from Rurki were not so good as the men who formerly entered the Imperial Service, and he thought that was due chiefly to the fact that the openings in the Public Works Department were not as good as they now were in other services. It was the European chiefly who went to Rurki in former days when officers from Rurki were appointed to the Imperial Service, but even then there were some Indians and a considerable number of Anglo-Indians. Europeans did not go to Rurki now. The demand for entrance into the Public Works Department might be gauged by the demand for entrance to Rurki. He was not prepared to say there was

* A note on this point was afterwards put in by the witness and has been printed as Appendix I.

not a keen demand on the part of Indians to gain admission to Rurki; and he did not say that the standard of Indians had fallen off; in his opinion as good Indians got into the service now as formerly. What he did contend was that Anglo-Indian and domiciled European candidates were not so good now as they used to be; and the reason for this was that they were not contented with the Provincial Service. Assuming that the Provincial Service was intended to provide a career for Indians, he did not think it necessary to improve the conditions of the service so as to attract Anglo-Indians of the class which formerly entered the Imperial Service. The Anglo-Indian and domiciled European who wished for something better than the Provincial Service could go to England. He suggested that young Indian graduates from Rurki might be nominated for the upper subordinate service of the Public Works Department as that would give the Service more upper subordinates of the kind required. His proposal was to improve the pay of the upper subordinate Service in order to attract a better class of Indians, but he thought that in any case there should be some form of nomination. He thought it would be possible appreciably to improve the pay of the upper subordinate Service without raising the pay of the Provincial Service. Although the starting pay of the Provincial Service would be less, officers in that Service could rise to the rank of Chief Engineer, whilst the upper subordinate officer would not rise beyond the rank of a sub-divisional officer.

71,294. It was difficult to get temporary Engineers under existing conditions of pay, but if the temporary Engineer establishment was improved or placed on a more permanent footing he was not sure that enough temporary Engineers would not be obtained in India. A large number of Indians were employed as temporary Engineers, about 170 in all, and Local Governments found an increasing difficulty in getting temporary Engineers of as good quality as used formerly to be obtainable.

71,295. (*Sir Valentine Chirol.*) The witness was of opinion that the prospects now held out to men passing out of Rurki had discouraged Anglo-Indians and domiciled Europeans, and this would have been regrettable if the College had been established for Anglo-Indians or domiciled Europeans; but he understood that Rurki was established to provide for Indians only. In the early days, when officers in India could obtain for their sons a very much cheaper education at Rurki than in England, with good prospects of an appointment in the Imperial Service, young men were sent there, but they were not attracted by the Provincial Service. He throught the average Indian now obtained from Rurki was as good as he used to be.

71,296. The witness said the theoretical training in irrigation in England was better than could be obtained in India, but practical work was best carried out in India. All matters connected with hydraulics demanded a higher training than other branches of engineering. He thought the training in India on irrigation works was even better than could be obtained in Egypt or America, or at least as good, with the exception perhaps of one or two important works in those countries. It would be a good thing, he thought, for a man to visit works in other countries but he was not keen on giving the men a year's practical training on such works. He was in favour of giving engineering officers facilities later in their career to visit foreign countries on deputation.

71,297. (*Mr. Rahim.*) The witness said he was satisfied with the class of Indians now going to Rurki and had no suggestions to make for securing a better class. By class he meant social standing, not necessarily caste, though no doubt social status depended to some extent on caste. Not every Rurki officer proved successful, but the Rurki men were satisfactory on the average. Any improvement that could be made in the social status, whether of Europeans or Indians, would be of benefit to any Service. He did not complain of the average Indian trained engineer; his intellectual capacity was very good. Even if there was a keener desire on the part of Indians to qualify as Engineers in the Public Works Service he did not think the proportion should be increased, because it was necessary to retain for a considerable time a large proportion of the administrative and higher appointments in the hands of Europeans, both on administrative and on technical grounds. In his opinion Europeans were more efficient administrators. Some Indian Engineers had an exceedingly good technical knowledge but were less able than the Europeans to put it into practice. He could not say how many Indians had risen to administrative rank, as the Provincial Service had not been long enough established and Provincial Service Engineers would only be just reaching the stage of promotion to the rank of Superintending Engineer. Many of the old Rurki Engineers, Indians, Anglo-Indians and domiciled Europeans, had risen to administrative rank. If it were not feasible to have a Central College in India, it would be a good thing to co-ordinate the work of the various Colleges.

71,298. (*Mr. Madge.*) There had always been Anglo-Indians and members of the domiciled community at Rurki, but he understood that the primary reason for establishing Rurki was to provide for Indians in India, just as Cooper's Hill was established to supply Europeans in England. Domiciled Europeans and Anglo-Indians wishing to rise beyond the level of the Provincial Service could go to England for their training, though he admitted there might be men who had not the means to do so. To assist such people to get into the Imperial Service he did not see why a system of scholarships should not be established for statutory Natives of India.

71,299. With regard to temporary Engineers, the witness said the temporary Engineering establishment was organised on a quasi-permanent basis and was intended to eke out the deficiencies of the permanent establishment. The cadre was based on the number of superior appointments, and as the cadre was now constituted, the numbers of Executive and Assistant Engineers were almost equal. But every divisional appointment carried on an average from 2½ to 3 sub-divisions and consequently there was not a sufficient number of Assistant Engineers to man more than one out of every three. The upper subordinate establishment was intended to man the remaining sub-divisions, but in practice it was found impossible to get a sufficient number of qualified upper subordinates, and temporary Engineers were therefore employed in many of these permanent posts. As the cadre was now calculated it was intended that Assistant Engineers should reach Executive rank after ten years' service. If there were sufficient Assistant Engineers to hold all the sub-divisions, many of them would take much longer than ten years to get a divisional charge. Even as it was, there was a block in promotion. On the other hand an increase of divisional charges would allow of an increase being made in the number of Assistants, and this would tend to reduce the number of sub-divisional charges held by temporary Engineers. The forty-two extra appointments that had been sanctioned would go a very little way to meet the difficulty and a still further increase would be required.

71,300. With regard to training, there was no reason why the training in India should not be raised to the highest possible standard, and he advocated that it should be so raised in the interests of the country. He thought Rurki did provide a sufficiently good training now, but England provided a better.

71,301. One Central Institution to cater for the Department would no doubt be a good thing, but he believed the divisions in India necessitated having more than one Central College. The Provincial Government of Madras might prefer to retain its own Institution. At present the Government of India made no appointments in Madras.

71,302. The witness considered that Anglo-Indians were fairly good at their work and generally discharged their duties with satisfaction.

71,303. (*Mr. Macdonald.*) The witness said that in advocating an increase of the cadre he had not considered the possibility of substantially diminishing the work now being done, building work for instance, in Provincial towns, and of handing this work over to ordinary private agencies. He did not think the number of Engineers in India in private practice was very considerable. No doubt the fact that the work was done by the Public Works Depart-

ment tended to diminish the number of Engineers in private practice.

71,304. As a rule the Department framed an estimate of the cost of a work and called for tenders. Work was occasionally carried out by departmental labour, but, as a general rule, tenders were called for all work of magnitude. If a hospital had to be built in England the medical authorities would lay down their requirements and the Public Works Department would have nothing to do with the matter. In India the Public Works Department would be responsible for designing the hospital and for supervising the carrying out of the work. As Government money was spent on the hospital it was necessary to have a Government Officer in the position of Clerk of Works. The supervision of building work formed but a small fraction of an officer's duties; he had besides to construct and maintain roads, bridges, etc. There might be cases in which the building under construction was large enough to employ the whole time of Public Works Department officials and he admitted that in a case of that kind there might be a saving if the work was entrusted entirely to private agency. He doubted very much whether the appointment of temporary Engineers as Clerks of Works for twelve or six months would materially reduce the staff of the Department. In some cases this was just what happened now. For instance, if the construction of a large canal was sanctioned, thirty or forty Engineers would be employed on it, and when the work was over they would be discharged. The difficulty of late years had been to get temporary Engineers. The witness said his proposal for an increased cadre was put forward with the idea of getting a larger percentage of the men employed in permanent posts. He did not think it would be possible to carry out large works in accordance with the system adopted in England. The employment of a temporary Clerk of Works on a building might reduce the establishment by a few men but it would be a very small saving.

71,305. With regard to conditions of salary, the witness said he assumed that a man recruited to the Department had a right under his terms of recruitment to obtain a divisional charge in his eleventh year. That was part of the obligation which the State was under and the cadre was based on that. It was probably not a legal contract with the individual, but it was a moral contract. If a man did not get the charge he ought to get the pay of the charge. When the pay of the various grades was fixed every care was taken to recruit the establishment in such a way as to ensure a normal flow of promotion. Possibly a man has no grievance at law if he were not promoted. In the old days an Engineer did not rise to a divisional charge until after fifteen years' service, and that caused a good deal of discontent. He himself was blocked for nine years. It was true the Secretary of State had laid down specifically that unless a man had charge of a district he was not to rise above R800 a month, and everybody now knew the conditions.

71,306. With regard to privilege leave, the witness said it was the desire of the Service that leave should be allowed to accumulate beyond three months. At present a man accumulating three months' privilege leave did so at his own risk, Government only guaranteeing one month per annum which might or might not be accumulated for three months. An extension beyond the three months to four or six was possibly not in accordance with the fundamental intention of privilege leave, which was meant to provide a short rest once a year. The general idea of the Service was that if a man earned four months' privilege leave there should be no arbitrary restriction against his taking it. It was within his power to take a month each year, but if an officer chose to have no leave for five years and to take five months in the sixth year he did not see why he should be prevented.

71,307. (*Mr. Fisher.*) With reference to the paragraph in the written statement that "construction may involve the creation of twelve or more superior posts, which as long as construction is in hand are deemed temporary appointments and as such are excluded from the superior posts on which the cadre is calculated," the witness said that what he had in mind was a scheme such as the Triple Canal project which required a certain number of officers for its upkeep after it had been constructed. Work of that sort might require fifty or sixty officers during the construction period and when the work was completed it would provide for a considerable number of permanent charges.

71,308. With regard to the advantage of Engineering training in India and in England, the witness pointed out that the training of an Engineer was both theoretical and practical, and the theoretical work could be better done in an English University than at Rurki. He based that opinion simply on observation. The newly recruited Indian College Engineer when asked to do a simple calculation, such as calculating the size of a beam to carry a certain weight or making an elementary stress design, frequently did not know how to set about it, but the average man from England had learned how to do calculations of this kind though he had not had occasion to apply his knowledge. For the first two or three years the Rurki Engineer was a better man owing to the fact that he had received practical training in work more closely akin to the work he would have to do afterwards; he knew the conditions of the country and the language how bricks were made in India, and various other things which the man appointed from home did not know. As a matter of fact, the man appointed from home probably had to unlearn a great deal. Many branches of Indian Engineering work such as Irrigation could not be practised at home. In many respects practical work in India was carried out differently from the way in which it was done in England, and the Rurki man was acquainted with the methods of Indian Engineering practice. If the same educational facilities could be obtained in India as now existed in England, it would be more useful to have an Engineer College for Englishmen in India.

71,309. (*Mr. Sly.*) The present idea was to select men in England not only on technical qualifications but with regard to social status, and he himself attached considerable importance to a man being of the right social status. It might be feasible to have open competition in technical engineering subjects as between the students of different Engineering Colleges in England, and he thought the position a student took in the Honours School of an Engineering College in England depended solely on the results of the final examination and not on the record of the student during his Course. He did not see that there would be any difficulty in marking students who had specialised in different branches of engineering, and he saw no practical difficulties in the way of holding an open competition in Engineering subjects.

71,310. The witness said he saw no reason why an Engineer should be forced to go at the age of 55 as long as the rule was made applicable to future entrants and was applied to other Services.

71,311. With regard to pay, there had been a very substantial improvement in the pay of Chief Engineers in 1905. The pay formerly authorized was Rs. 2,500 for first class Chief Engineers, Rs. 2,000 for the second class, and Rs. 1,800 for the third class. The latter class was abolished and the pay of the other two increased by Rs. 500, but he did not consider that sufficient. He thought it would be better to have only one class of Chief Engineer because they all did the same work. The Secretaryship to the Government of India was raised from Rs. 3,000 to Rs. 3,500 in 1905, and he recommended it should be now raised to Rs. 4,000 on the ground of the importance of the work.

71,312. (*Mr. Gokhale.*) The witness's statement that the Provincial Service had not attracted to the Indian Colleges the same class of men as formerly went to them applied only to Rurki as he had no personal knowledge of other Colleges. If, instead of creating the Provincial Service, the Government, in 1895, had passed orders to the effect that recruitment in India was to be increased and recruitment in England diminished, he thought the Service would have suffered in time, in spite of the fact that the proportion of Indian recruited men who rose to high administrative charges was greater than the proportion of men

recruited in England. Without testing it witness could not accept this statement as a fact. The fact that for a certain period a number of Rurki trained Engineers rose to administrative ranks did not necessarily indicate that the Public Works Department could do without a leavening of European Officers. The appointments to the administrative grades were really made by seniority unless a man was absolutely useless. The number of men who were declared to be unfitted for promotion to Superintendent Engineers was not great. In witness's opinion the average man appointed by the Secretary of State was a more capable administrator, but he did not think he could establish that view by tracing the official careers of individual officers. In his judgment no political considerations were involved in making appointments to the Department, and therefore the men who had the best education in Engineering should be employed whether they were found in England or in India.

71,313. With regard to the training at Rurki and other Colleges, the witness said the training at Rurki was good but he did not know anything about the other three Colleges; he had always understood they were not so well equipped as Rurki. He believed the Government was doing all that it was possible to do to raise the Indian Colleges to the highest state of efficiency. He did not hold the view that a larger proportion of men should be recruited in England for the higher offices simply because the Public Works offered a good career for young Englishmen. He put it forward in the interests of Engineering work in India. He had no doubt, if a private meeting of the Commission was held, he would be able to substantiate his remarks as to relative efficiency by tracing the careers of individuals, or at least be able to specify a number of men who were relatively inefficient and among whom there would be a greater proportion of Indians than Europeans.

71,314. (*Mr. Chaubal.*) The witness said he would have no objection to an experiment in competitive examination among students of all the Engineering institutions of Great Britain. No instances of defects in the present system of selection had ever come to his knowledge. Under the system in force at Rurki it was possible for a man who had come out first at the end of the three years' course to be superseded by a man who had come only tenth on the examination list at the end of the first year's apprenticeship. Ultimate selection depended on the reports received from different officers. Men who were number 1 and number 9 on the examination list might be sent to Burma and Burma would select between the two and No. 9 might be selected in preference to No. 1. The report received about No. 1 from Burma might be much better than the report received with regard to Nos. 3 and 5 who had gone to the United Provinces, and yet No. 1 might be rejected. Rejected apprentices might get appointments as Temporary Engineers. For some years the number of students at Cooper's Hill had exactly corresponded to the number of appointments to be filled in India four years later.

71,315. On the subject of training, he thought the Indian trained at Rurki was less able to apply his theory to practice, and it was therefore desirable that he should be given an opportunity of practical work to show how he was likely to turn out.

71,316. With reference to the proposed increase of salary for Chief Engineers, the witness said that his suggestion was put forward partly on the ground that all Chief Engineers should receive the same pay and partly in order to avoid the anomaly of a senior officer in one Province drawing less emoluments than a junior officer in another Province. He was not prepared to apply the same principle to the grades of Executive and Assistant Engineers, if it meant paying an Indian Assistant Engineer the same emoluments as a European Assistant Engineer. He would not advocate that even in the case of Chief Engineers. He did not see how it was possible to avoid a higher paid officer working occasionally under a lower paid officer.

71,317. (*Sir Theodore Morison.*) The witness said that before becoming Secretary to the Government of India he was Chief Engineer in Burma. As an Executive Officer he served twenty-five years on the Punjab Irrigation and in Burma he was employed on buildings and roads.

71,318. With reference to the question of recruiting Indians with an English training, the witness said they would have to be appointed to the Provincial Service by the Secretary of State. He thought that the discontent and heart-burning in the Service were somewhat less aggravated than might be gathered from the written statements that had been submitted to the Commission. He could quite understand the arguments for putting everybody on an equality, and probably there was some legitimate cause of discontent, but he did not think it was acute. His own view was that the question of salary was not the chief cause of discontent, at least, among Indians.

71,319. Asked whether it would be possible so to organise the Service so as to ensure that Officers were graded according to the class of work they had to perform, the witness said that in practice they endeavoured to do that now. The Provincial Executive Engineer was given what was considered to be a suitable charge, usually a division where the work did not require high technical skill, but at any time the division might become an important one, so that it was impossible to earmark charge. It would be difficult to keep a Provincial man always in charges that were ranked as Provincial for the time being. When a Provincial man reached divisional rank it was usually arranged that he should be given a suitable charge. It was possible that a classification better than the present one would be an Imperial Service with a Provincial Service with a position corresponding to that of the Provincial Civil Service, and in that case Indians would be recruited into the Imperial Service in England.

(The witness withdrew.)

H. J. Hope, Esq., Executive Engineer, United Provinces.

Written Statement relating to the Public Works Department, being a Memorandum by the United Provinces Local Secretary to the Civil Engineers' Association, representing the views of the Imperial Service Engineers of the Public Works Department of the United Provinces.

71,320. (I.) **Method of Recruitment.**—(1) The present system of recruitment by selection is generally considered satisfactory, but should be limited to candidates who have resided for at least seven years in Europe. There is a disadvantage in recruiting Indians in England, as it is not always the most suitable candidates who are willing and can afford to go to England. Moreover it tends to lower the standing of Indian Engineering Colleges, and causes discontent among his confrères for a fellow to be ever afterwards classed as an imported Engineer merely on the strength of a short education in Europe. It is too late in life for a youth of eighteen to acquire the British spirit from three years' residence in England, and European engineering methods could be better studied later on under the Study Leave Rules.

(2) One year's practical experience on works in Europe, and some knowledge of accounts should be insisted on.

(3) Every candidate should have been at a recognized Engineering College for at least three years, where he would have rubbed shoulders with other fellows of his own standing, and, at the end of his course of study, have obtained a diploma or other degree which is accepted by the Institute of Civil Engineers as qualifying for their associate membership. The A.M.I.C.E. Examination in itself is not considered a sufficient qualification.

(4) The selection Committee should consist of:—

(1) A retired Lieutenant-Governor or Chief Commissioner as president.

(2) An eminent Engineer with considerable experience in England, preferably a past President of the Institute of Civil Engineers.

(3) An eminent Principal or Professor of an Engineering College of high standing in England.

(4) A recently retired Engineer of the Indian Public Works Department.

(5) An Indian Public Works Department Engineer actually in service, selected from the men who are at home on leave each year.

(5) The most suitable age for recruits to come out to India is between 22 and 24 years.

(6) There is great resentment in the Department at the appointment of Royal Engineers and Temporary Engineers to the permanent scale above the heads of men already in the Department. They should come on to the permanent scale only at the bottom of the list. The Royal Engineer anxious to enter the Public Works Department should make up his mind early in his career, and enter with his contemporaries. This rule should admit of no exception.

(7) For recruitment in India, the Colleges for Engineers should be separate from those for subordinates. It is not desirable that members of the superior service should live on intimate and familiar terms with subordinates, yet this undoubtedly happens, and it is encouraged by the two classes being educated together at the same College. Entrance to the Colleges should be by selection, combined with a qualifying examination.

(8) The present system of deputing two Indian College students for one appointment, *vide* P.W.D. Code, Vol. I., para. 151, and placing them for practical training under different officers is objectionable and dangerous. The qualified candidates should be appointed as Probationary Assistant Engineers and allowed to qualify by practical training for confirmation. The age for confirmation should be the same as for Engineers appointed from England.

71,321. (II.) **System of Training and Probation.**—It is felt that the present system of Departmental examinations is sufficient, and that Engineers appointed in England attain to an adequate proficiency in the Indian languages. The Examination in reading Native accounts might well be dispensed with, as the figures can be learned in a short lesson, and are afterwards soon forgotten.

71,322. (III.) **Conditions of Service.**—(1) It is desirable that the Engineers of the Department be constituted into a service under some such name as the "Indian Service of Engineers" (I.S.E.). The term Public Works Department is used by both subordinates and clerks, and consequently cannot be held to distinguish an Engineer Officer. This would only be following the lead set by other Departments, such as the Educational, Medical and Forest Services. It is felt that the table of precedence should be revised, so as to give Engineer Officers an official status more in keeping with their importance to the prosperity of India.

(2) All Officers should be compelled to retire on attaining the age of 55 years, without exception. The relaxation of this rule in recent cases has led to a large amount of discontent.

(3) The rule which lays down that a Chief Engineer should not be allowed to hold the same post for more than five years should allow of no exceptions.

(4) It is desirable that Government should weed out members of the Department, who are reported on as unsuitable or inefficient. A man, who has been reported on unfavourably for two consecutive years, should be warned that if he does not prove himself efficient, his services will be dispensed with. If, after another two years, he is still found unsuitable, then he should be compulsorily retired under the ordinary gratuity or pension rule allowed for men who are compulsorily retired as invalids. Of these four unfavourable annual reports, at least three should be by different Superintending Engineers.

(5) The employment of Temporary Engineers should be reduced to a minimum, as in many cases they hold Divisional charges, in which qualified Assistant Engineers would otherwise be officiating. Moreover, it creates a discontended class of men, who have a very real grievance, in that whilst doing the same work as permanent Engineers, they draw no extra pay, and have very precarious prospects.

(6) In order to ensure a regular flow of promotion, recruitment should be regulated so as always to make up the number of Assistant Engineers of less than eleven years' service, as nearly as possible to the number required to give a proportion of five Assistant Engineers to each four Divisional charges in the Province. This proportion should be the same for both Engineers appointed in England and in India. The remaining sub-divisional charges should be held by Sub-Engineers and experienced and senior Upper Subordinates.

(7) An Officer transferred from one station to another should be reimbursed the whole of his actual expenses incurred in transporting himself and his family, servants and belongings. Under the present rules, men with families are often severely crippled by the heavy expenses of a transfer.

71,323. (IV.) **Conditions of Salary.**—(1) The system of annual increments in salary meets with general approval.

(2) The present scale of annual increments in salary as far as it goes is generally considered sufficient for an Officer's immediate needs, but it does not permit of an officer saving as much to eke out his totally inadequate pension, as he had every reason to expect from the conditions existing when he joined the Department.

(3) The rule introduced in the Government of India's resolution of the 15th May 1912 by which an officer cannot draw more than Rs. 800 a month under the system of annual increments till he is appointed to a Divisional charge, will bear very hardly on some officers, and should certainly be rescinded in the case of those officers who are reported on as fit for a Divisional charge. It is not right that the annual increments of an efficient officer, who is reported on as fully qualified for a Divisional charge, should be stopped, not on account of any fault of his own, but solely due to erratic recruitment. Similarly, an Indian Engineer, who is reported on as fully qualified for a Divisional charge, should be allowed to draw increased salaries beyond Rs. 535 a month, according to the scale of annual increments, without consideration of whether he is actually in charge of a Division or not. Similarly, many Executive Engineers, reported on as fully qualified for administrative rank, will be unduly held back at Rs. 1,250 a month, merely because of errors in recruitment. There is a strong feeling that Executive Engineers, who are certified as fit for Administrative posts, should have their pay increased beyond Rs. 1,250 a month by annual increments of Rs. 50 a month up to a maximum of Rs. 1,500, which they would thus attain after a minimum of twenty-four years' approved service. Similarly, Indian Executive Engineers, who are certified as fit for Administrative rank, should have their pay increased beyond Rs. 850 a month by annual increments of Rs. 35 a month up to a maximum of Rs. 1,025, which they would thus attain after a minimum of twenty-four years' approved service.

(4) Promotion to Chief Engineer, 1st Class, becomes so badly blocked at present, that many specially deserving officers never obtain a chance of promotion to the higher rate of pay. It is felt there should be only two classes of Superintending Engineers, and one class of Chief Engineer, as for Commissioners of a Division in the Indian Civil Service. The rates of pay of Administrative ranks should be:—

	Engineers appointed in England. Rs.	Indian Engineers. Rs.
Superintending Engineer, 2nd Class	1,750	1,500
Superintending Engineer, 1st Class	2,000	2,000
Chief Engineer	2,750	2,750

And a Secretary to a Local Government or Administration should get a local allowance of Rs. 250 in addition, as at present. The number of Superintending Engineers in the 1st Class should be the same as in the 2nd Class. The extension of the system of annual increments to the Administrative ranks would be a mistake.

71,324. (V.) **Conditions of Leave.**—(1) The amount of leave allowed under the existing rules is generally considered sufficient, but it is sorely felt that it is impossible to take as much forlough as is desirable for proper health, owing to the smallness of the furlough allowances. The present allowance is barely a subsistence allowance for a junior officer, and leaves no margin for expenditure in attending professional lectures or visiting Engineering Works. An officer,

who is keen on improving his professional qualifications and bringing his knowledge up to date in European practice, is thus discouraged. At present the most junior Royal Engineer officer in the Department gets a leave allowance, which a Civil Engineer can only hope to reach after eighteen years' service. It is unanimously urged that the leave allowances should be revised so that an officer on furlough or special leave will draw half his substantive salary subject to the minimum of £500 a year, which is at present laid down for the Indian Civilian and Military Officer subject to the Civil Leave Rules.

(2) The opinion is also strongly expressed that it should be open to every officer to take all the privilege leave which he has earned at any time during his service, when he can be spared. It is unjustifiable that an officer should be penalised because he cannot be spared, or because, in his keenness for his work, he may prefer to see his job through instead of applying for leave when three months happen to be due to him. Privilege leave once earned is as much due as an officer's pay, and the rules should be framed in such a manner that it can never be lost to him.

(3) Furlough cannot be taken till an interval of not less than eighteen months has elapsed since last return from privilege leave of over six weeks' duration. This rule should be relaxed, as it discourages an officer from taking privilege leave in India, when it may be very necessary for his proper health.

(4) A proposal which is unanimously urged is that an officer on furlough should be allowed to draw double furlough allowances for half the period of furlough which is due to him. For instance, that an officer with twenty months' furlough due to him, should be allowed to take ten months' furlough on double the ordinary furlough allowances, and end up with no balance of furlough due to him; or to take any less period, say six months, on double the ordinary furlough allowances, and end up with a balance of eight months (twenty months' less twice six months) still to his credit.

(5) The principles laid down in the foregoing sub-paragraphs concerning leave have already been recommended by the Decentralization Commission, and might well be adopted. They amount to the opening of a ledger for each officer showing on the credit side the amount of leave earned, against which he can draw at any time and in such a manner as suits Government and his own interests. It is felt that no useful purpose is served by the rule which lays down that an officer must have rendered eight years' active service before he can be granted furlough. It would be in the interests of the service to give a junior officer an opportunity of recruiting his health, or of renewing his acquaintance with the progress of his profession, by allowing him to take furlough after four years' active service. Similarly, it is felt that private employment during furlough should not be prohibited, as it would give a keen officer an opportunity of gaining experience to the interests of the Service.

(6) Opinion is unanimous that the rules for the grant of study leavee to officers of Scientific and Technical Departments should be extended to officers of the Public Works Department. Engineering is a progressive science, and it would be to the advantage of Government if officers were allowed periods of study in order to keep abreast of modern developments.

(7) The Indian Service leave rules should be abolished, and there should be the same leave rules for all officers of the Department.

71,325. **(VI.) Conditions of Pension.**—(1) The greatest grievance of the Department, and one which is sorely felt, is the totally inadequate pension to which officers become entitled on retirement under existing rules. The present pensions are actually less than they were forty years ago, and when the higher qualifications now required from men joining the service, and the general rise in the cost of living are taken into consideration, they compare still more unfavourably than the actual figures indicate. It is strongly urged that the Memorials on this subject recently submitted by a large majority of the officers of the Imperial Service, should receive early and favourable consideration. Numerous Memorials on this subject have been submitted during the last six years, and the delay in the issue of first orders on the case has given rise to a considerable amount of discontent. The Engineer appointed in England is expected to live in the same style as the Royal Engineer and the Doctor, and there is no reason why he should be able on retirement to arrange his home menage on a more economical scale than they. He claims equal treatment from Government in the way of pension.

(2) Article 4 of the Civil Service Regulations lays down that an Officer's claim to pension is regulated by the rules in force when he retires. In view of the delay in the issue of final orders on the Memorials already submitted, it is urged that this rule should be held in abeyance in the case of those men who are compulsorily retired before final orders are issued.

(3) The scale of invalid Pensions is meaningless at present owing to the absurdly low maxima limits prescribed, and opinion is unanimous that the maxima limits, as laid down in Article 641, should be revised to agree with those shown in Article 474 of the Civil Service Regulations.

(4) A large majority of the Engineers appointed in England consider that a family pension scheme should be started, and that Government should bear a portion the cost. Pension has been officially laid down to be deferred remuneration, and consequently it is clearly the duty of Government to reimburse this deferred remuneration to his family in all cases when an officer dies before he has drawn it all in the shape of pension. The majority of men are willing to contribute 6¼ per cent. of their salaries towards a Family Pension Fund, and it is felt that Government should also contribute an equal amount. With this datum, the amount of family pensions, payable in the event of an officer dying, should be worked out on an actuarial basis, allowing five per cent. per annum compound interest. Bachelors would subscribe at the same rate as married officers with families, and as a set off they might be allowed to make voluntary subscriptions to a Provident Fund, and receive five per cent. compound interest thereon.

71,326. **(VII.) Division of Services into Imperial and Provincial.**—(1) It is undesirable to lay down definitely that certain fixed Divisional charges, or even a fixed proportion of Divisional charges should be reserved for Provincial Engineers, as laid down in the Government of India Resolution of the 24th of April 1908. Provincial Service Engineers being borne on the same list as Imperial Service Engineers, the appointments to Divisional charges should be by selection only.

(2) It is felt that, in the interests of efficiency, the proportion of imported Engineers in the Service should be for the present not less than sixty-six per cent.

(3) It is agreed that Engineers of the Imperial and Provincial Services should be borne on the same list, but it is felt that the principle laid down in Article 85 of the Civil Service Regulations is fair and equitable, *i.e.*, that an officer serving in his Native land should get only two-thirds of the pay he would draw while working outside his Native land. It is an economic fact that imported labour has invariably to be paid more highly than home labour, and there is no reason why India should pay the same for her Native-born Engineers, as the Secretary of State has to offer to the pick of English Engineers in order to induce them to serve in a foreign and distant clime. The Englishman serving in India is not working under the same conditions as the Indian, inasmuch as he cannot live so cheaply, and is exposed to adverse climatic conditions. He has also to bear the expense of long and expensive journeys home periodically for himself and his family. Education for his family in England costs considerably more than education in India. The case is complicated by the presence of a small body of the domiciled community in the ranks of the Provincial Service. These men have English habits, and undoubtedly labour under hardship and discontent, but no reasonable remedy has been suggested. Having made their domicile in India, they must throw in their lot with His Majesty's Indian subjects. The scale of pay laid down for the Provincial Service is undoubtedly sufficient for the pure Indian, and certainly attracts Indians of high attain-

ments. A great deal of the discontent in the Provincial Service is due to certain men, after failing to get an appointment to the Provincial Service, having subsequently obtained an appointment to the Imperial Service. It is felt that a recurrence of this discontent could be avoided by limiting recruitment in England to candidates who have resided for at least seven years in Europe.

Mr. H. J. Hope, called and examined.

71,327. (*Chairman.*) The witness said he was Executive Engineer of the Cawnpore division of the Lower Ganges Canal, and he represented the views of the Imperial Engineers in the United Provinces. He also acted as Local Secretary to the Civil Engineers' Association in the United Provinces.

71,328. The witness said the chief points in his written statement related to leave allowances, pensions, and the desirability of establishing a Family Pension Fund.

71,329. With regard to recruitment, instead of the present policy of recruiting about 30 per cent. of the superior Service in India and reserving 10 per cent. of the remainder for selection by the Secretary of State in England, he would abandon recruitment of Indians in England and substitute in its place recruitment in India from the Indian Colleges. Under his scheme recruits in India would be appointed to one-third of the vacancies in the department. He meant no retrograde step, as this proportion of Natives of India was about the same as existed in the United Provinces at present, and he meant it to be the same. As to recruitment in England, he insisted on a seven years' domicile with a view to discouraging the Indian from going to England, as he believed the recruitment of Indians in England was in part responsible for the discontent that now existed. He thought it would be better for all Indians to be recruited direct in India, and it would assist the Indian Colleges if this principle were enforced.

71,330. The witness did not consider the present qualification of the A.M.I.C.E. examination was sufficient in the absence of a residential course in a College for the formation of character. He thought the majority of officers now in the Service had gone through a residental course of three years and a year's practical training, and he wanted to insist upon that for everyone. At present there was no probation for Imperial Engineers. The senior men were in favour of such probation but the junior men were not, as they considered the terms of service were not good enough to attract candidates into the department as probationers. They were under the belief that a probationary period would adversely affect recruitment, but the witness agreed that a good man would not be deterred from coming into the service by any consideration of that kind.

71,331. With reference to recruitment in India, the witness said he would substitute for the present competition for entrance to the Indian Colleges, a system of nomination followed by a qualifying examination. Nomination would ensure physical fitness and respectability, and the due representation of the various castes. He thought it necessary to prevent an undesirable predominance of any caste in the Service. He did not think a qualifying examination would result in their obtaining students of lower intellectual calibre. He would abandon the present system of appointing two apprentices in each Provincial Service vacancy. He would appoint only one man in each vacancy, and if any of the probationers failed to qualify for confirmation, the deficiency in staff would have to be made good in the following year. The present system produced very great anomalies.

71,332. With reference to salary, his proposal was that an officer who was reported to be efficient should be allowed to advance by annual increments to Rs. 1,500, but if not thoroughly fitted for an administrative post, he should stop at Rs. 1,250, and if not fully qualified for the charge of a Division, he should not rise above Rs. 800. His proposal went on the assumption that an officer believed that at a certain period of his career he would be in possession of a charge, but he admitted that the Government had not given any pledge of that kind. An officer, however, when he entered the service certainly expected to get a division in ten years. It was important that the idea should not get about that Government was benefiting by its own mistakes in recruitment.

71,333. The witness said that the number of administrative and Executive posts asked for by the Local Government in the revised cadre, after allowing for expansion, was 63. Recruits appointed in 1913 would not get charge of divisions till after seventeen years' service. Unless the rule was changed, they would be blocked at Rs. 800 for about seven years.

71,334. The witness thought it would be a mistake to extend the system of annual increments to officers in the administrative ranks. It was necessary to make promotions to the administrative grades by selection.

71,335. Royal Engineer officers, witness considered, should enter the cadre at the bottom of the list and should not be put over the heads of Civil Engineers. There were some instances of Royal Engineers being placed over the heads of Civil Engineers, and many officers were discontented in consequence.

71,336. The retention of officers after the age of fifty-five resulted in a block of promotion, and this had caused a great deal of discontent. He thought it was to the benefit of the public that there should be an even flow of promotion and that blocks should be prevented.

71,337. With reference to the suggestion in his written statement that the Indian Service leave rules should be abolished, the witness admitted that there were certain conditions which might be taken into account in deciding whether the same leave rules should apply to Indians and Europeans, but he recommended that they should not be taken into account. He desired to help the Indian to go to England at a later stage of his career in order to make himself acquainted with work there, and he would be encouraged to do so if there were uniform rules as to furlough. The only difference he would make would be in the case of a man who spent his furlough in India instead of in England.

71,338. In connection with the proposal for a Family Pensions' Fund, the witness said pension was considered to be deferred pay, and if an officer died, the pension he had earned by service was lost. Government forced officers to subscribe to the Provident Fund and therefore recognised that it was a man's duty to make some provision for his wife and family. He and his colleagues would welcome the establishment of a Family Pension Fund even if Government made no contribution to it. His own idea was that the Family Pension Fund should be in substitution for the General Provident Fund. It was essential that every Imperial Engineer should subscribe a percentage of his salary to the proposed fund from the day he joined the service.

71,339. (*Mr. Gokhale.*) The witness was of opinion that lately a few officers had been recruited to the Department from England who had received a training inferior to that obtained at Rurki. He did not think the best teaching possible in India was equal to the best teaching obtainable in England. An Indian educated in England should be appointed to the Provincial Service, because he did not think an Indian would obtain sufficient benefit from a three years' course in England to entitle him to join the Imperial Service. For that it was necessary that he should have been educated in an English Public School.

71,340. With reference to his statement that Engineers recruited in India did not possess the British spirit in the same degree as Imperial Engineers, the witness quoted the following extract from Sir Valentine Chirol's book on *Indian Unrest*: "Until quite recently the educated classes have held almost entirely aloof from any but the liberal professions. Science in any form has been rarely taken up by University students, and for every B.Sc., the honours lists have shown probably a hundred B.A.'s. The Indian National Congress itself, as it represented mainly these classes, naturally displayed the same tendencies, and for a long time it devoted its energies

to so-called political problems rather than to practical economic questions. Hence the almost complete failure of the Western educated Indian to achieve any marked success in commercial and industrial undertakings." He also quoted the following from the *Pioneer*: "The men who have entered the profession have not shown themselves conspicuous either in technical knowledge or in those essentials of character and sense of responsibility in emergencies and business and administrative ability, without which technical skill alone is of little avail." Those views were accepted by the Officers in the Public Works Department, and he put them forward as representing their ideas on the subject. What he implied by British spirit was grit, character, a sense of responsibility in emergencies, and business and administrative ability, and he claimed that men recruited in India were inferior in those qualities. Whilst he urged that nowhere in the world was home labour paid at the same rate as imported labour, he admitted that the application of that principle might entitle the Indian to insist on the further principle that as far as possible home labour only should be employed and imported labour employed only in exceptional instances. He thought however that 33 per cent. of the posts in the cadre was the utmost that could be conceded to Indians at present. He did not agree that before 1895 the men recruited in India, judged by the numbers promoted to administrative rank, were found to be as good as the men imported from England. It was economical as far as possible to officer the Public Works Department by men imported from England, but he would take in locally recruited men also as there were political reasons for encouraging Indians.

71,341. The four officers who subscribed to the original report were elected by the whole body of Engineers in the Province. He himself had been elected first, but had been unable to attend the conference. He had been nominated by Government as the representative witness.

71,342. (*Mr. Sly.*) The witness said the question of private practice for Engineers during service in India was not discussed by his colleagues but only the question of permitting private practice during periods of leave on furlough. He did not think that officers on furlough would in any case go in for private practice to any extent as their time would be chiefly taken up by recreation. If private practice during furlough were allowed he thought officers would become more efficient owing to the fact that they would get a wider knowledge of Engineering practice than they could possibly obtain in India. He did not think, however, it was an important point, and the demand would probably disappear when the officers became more contented with their prospects.

71,343. (*Mr. Fisher.*) With reference to his recommendation that there should be no exception to the rule which prescribed that a Chief Engineer should not be allowed to hold the same post for more than five years, the witness said his idea was that someone else should be given a chance and that the flow of promotion should not be blocked. In making the suggestion they were not thinking of the requirements of the Public Service except in so far as it was in the interests of the service to give regular promotion.

71,344. The witness said he received his own Engineering training at Cooper's Hill. He was not acquainted with the education given at Rurki and could not therefore make a comparison between Rurki and Cooper's Hill.

71,345. (*Mr. Macdonald.*) He had gone into the various minutes and despatches governing the scale of pay of the Department and had read the Minute of 1893. He was not able to say whether there was anything in that Minute which justified the statement that the Government had been recruiting with the idea that a Divisional charge should be given to an officer after ten years' service, but in the old days officers went up the scale whether they were in charge of a division or not. He agreed that the Minute of 1908 did not justify him in saying that Government had been recruiting on the basis of promotion after ten years, but Mr. Russell had just now said they were. The Government gave no guarantee. He had not seen the advertisement of 1913 giving the scales of pay, and was not aware that it contained a foot-note that "Officers of the Assistant class will ordinarily pass into the Executive class at the eleventh year of Service, but no Imperial Engineer may draw more than Rs. 9,600 per annum unless he holds charge of a division or a charge of equal importance." He thought, however, that the word "ordinarily" was quite sufficient to make each man expect promotion after ten years, if he worked well. At any rate it would be owing to a mistake if there was not a division for him then, and Government should pay for its own mistakes.

71,346. (*Mr. Madge.*) The urgency for increasing the staff of Imperial and Provincial Engineers was due to the class of men now in charge of sub-divisions. He thought the work performed by Imperial and Provincial Engineers was on an equality. The education in Rurki he believed to be sufficient on the intellectual side, but he did not think it trained men for practical work as they could be trained in English Colleges. It was a general belief amongst Imperial Officers that the work of Provincial Officers who had been promoted to Executive rank was inferior.

71,347. There would be no objection to the employment of temporary Engineers on a purely temporary basis and provided they were not given charge of divisions.

71,348. The cadre should be so increased as to obviate a block in promotion to executive rank, as he did not think the number of divisions should be increased.

71,349. (*Mr. Abdur Rahim.*) The witness said he understood that the ordinary work of Sub-divisional officers employed on the roads and buildings was to make designs and prepare estimates, but unfortunately such a bad class of men was being obtained that this work had to be done by the Executive Engineers themselves. During the whole of the hot weather the witness had under him a sub-overseer an Rs. 70 a month and an overseer on Rs. 100 a month as his Sub-Divisional Officers. He had not been able to get his leave, because there had been nobody to do his work.

71,350. A large portion of the staff in the Irrigation and Roads and Buildings Departments was employed on maintenance work, and the sub-divisional officers were generally upper subordinates. It was not frequently the practice for an Assistant Engineer posted to a sub-division to obtain the assistance of an upper subordinate officer; generally he had no assistance at all.

71,351. (*Sir Murray Hammick.*) There was no arrangement in the United Provinces for providing a technical section at headquarters to undertake the larger designs and estimates. Every estimate was made in the divisions.

71,352. (*Mr. Housden.*) The witness desired that there should be the same leave rules for Imperial and Provincial officers; he desired to encourage the Indian to go to England on leave after having had some experience in India. On the Imperial list there were some Indian college Engineers who were under Indian Service rules for leave and pension. This caused a great deal of discontent, and the witness thought that such men should be put on to the same leave and pension rules as other Imperial officers.

71,353. When he said he did not think the number of divisions should be increased, he only meant to say that the proportion of sub-divisions to each division should not be decreased. The proportion was about 2½ sub-divisions to one division, and this was approximately right for the United Provinces.

71,354. He knew that Imperial Engineers had sent in memorials to Government asking for better pensions for Superintending Engineers and Chief Engineers. The present rule was that Superintending Engineers obtained an extra pension of Rs. 1,000 for three years' approved service but got nothing more unless they were subsequently appointed as Chief Engineers, and then only if they had been recruited before 1898. Witness asked that no dif-

ference should be made between the pension of the Superintending Engineer and that of the Chief Engineer. If a man was blocked for promotion to Chief Engineer through no fault of his own it would affect his immediate pay, but it ought not to affect his pension. He thought the request that an increase in pension of £40 a year should be granted for each year of service in the administrative grades was a reasonable one.

71,355. (*Mr. Clarke.*) The witness maintained that a man serving in a country which was not his native land ought to be paid more than if he were serving in his native land. If a Provincial Engineer was deputed to Europe he would only obtain under Article 85 of the Civil Service Regulations two-thirds of the salary he was drawing in India, but the witness recommended that, as a ative of India, he should get more.

(The witness withdrew.)

F. R. Bagley, Esq., M.Inst.C.E., Chief Engineer, Southern Punjab Railway.

Written Statement relating to the Public Works Department.

71,356. *Services of witness in brief.*—I joined the Public Works Department in 1871 with an Assistant Engineer's certificate from the Thomason College, Rurki, and worked as an Assistant Engineer in the Central Provinces, and on famine works during the Bihar famine of 1874, till, in July 1875, I was transferred to the Burma (State) Railways. For 23 years after, till July 1898, I worked on the Burma (State) Railways as Assistant Engineer, Executive Engineer, and finally, after 1891 as Engineer-in-Chief. From 1896 to 1898 I was lent to the Burma Railways Company as Chief Engineer. I returned to Government service in July 1898 as Engineer-in-Chief, and in January 1901 was appointed Chief Engineer of the North-Western State Railway (some 4,000 miles in length), which post I held till I retired on the maximum Chief Engineer's pension in September 1907. In 1908 I came out again as Chief Engineer of Construction for the Southern Punjab Railway Company and am still engaged in that capacity building railways in the Punjab.

My total service on works in India comes to over 40 years, during about 20 years of which I have held administrative posts as Chief Engineer. During that time I have come into close contact with nearly 500 Engineers, employed on the same works, or so near me as to give me a thorough knowledge of their qualifications and efficiency, and of this number some 200 have been directly under my orders as Superintending, Executive, or Assistant Engineers. They have been men of all ranks and recruited from all sources and I have good reason to believe that I am considered to have treated all with strict impartiality and to have been a good judge of character and efficiency and able to get out of each man the best work of which he was capable. References may be made on these points to the Government of India records.

I have given these details to show that my experience has been extensive enough to give me presumably a thorough knowledge of the qualifications and efficiency of the various types of Engineer officers in the Department. I take a deep interest in the welfare of the great Department in which I have spent a strenuous lifetime, and I offer to give evidence chiefly because I believe that in the present treatment of the "Provincial Service Engineers" and the "Temporary Engineers" there have been very serious mistakes made which will lead, unless soon corrected, to nothing short of disaster to the good name and efficiency of the service.

I shall take in order the "heads" under which remarks are called for, but to avoid confusion will deal separately with each of the three services into which the Public Works Engineering service is divided—

A.—The Imperial Engineering Service (to which appointments are made from England, or from the Royal Engineers in India).

B.—The Provincial Service (manned by passed students from the Indian Engineering Colleges, chiefly Rurki).

C.—The Temporary Engineer Service (appointments made in India on terms of one month's notice).

(A) *THE IMPERIAL ENGINEERING SERVICE.*

71,357. (I.) **Methods of Recruitment.**—I consider it a great pity that Coopers Hill College was abolished, but the present system of selection in England from qualified candidates is the best possible, and has worked so far with excellent results. Under present circumstances of supply of the likely material in India I think it is desirable that at least half the appointments should be made from England now and for some time to come. It will be possible to make a larger proportion of the appointments in India when the terms are made good enough to tempt the best class of domiciled European and Anglo-Indians, and of the Indians (a small class) to whom thi kind of service is attractive. I shall explain later on, in dealing with the Provincial Service, my reasons for this opinion.

71,358. (II.) **System of Training and Probation.**—There is at present no systematic training and the probation is nominal. The so-called "practical" experience in England is generally a farce, and in no case of much use for Indian works. At the same time this matter of training in India is of essential importance to the usefulness and success of every officer. I have known several men with the makings of good officers in them ruined for life by their first service being on unsuitable work, or under careless or tactless superior officers, who have not troubled about teaching them the details of work, or the spirit in which it should be done, and in which native employes and labourers should be dealt with. At the best it takes something like 2 years for a man fresh from England who comes out, ignorant of the language and of Indian methods, to become really useful, and it is an urgent matter that during this time of training he should be on practical work where he will get experience in details under a sympathetic officer who, by example and influence, will interest him in his duties and teach him how they should be carried out. I have always made it a point, as far as it has been in any way possible, to put every new arrival on to a year or two of Survey and Estimating work, and then for two years on construction work, under the right kind of officer, and with very successful results, and this should always be done systematically.

71 359. (III.) **Conditions of Service** are satisfactory on the whole.

71,360. (IV.) **Conditions of Salary.**—The Imperial Service Engineers have lately been put on a time scale of salary effecting a considerable improvement and appear to be sufficient to attract the right type of man.

71,361. (V.) **Conditions of Leave** are satisfactory on on the whole.

71,362. (VI.) **Conditions of Pension.**—Considering the importance of the work done by the Senior officers as acknowledged by the high rates of pay of the Chief Engineer and Superintending Engineer classes, there is no doubt that an improved scale of pension is called for. As a matter of fact, while the scale of pay has been recently increased, the maximum pension has been actually cut down to £525 a year, which is palpably out of proportion for a Chief Engineer drawing Rs. 2,500 to Rs. 2,750 per mensem. There should certainly be an approximation to the pensions laid down for services paying similar salaries, and the least increase that would be reasonable and satisfactory would be £700 a year for a Chief Engineer of 3 years' service in that rank and £600 a year for a Superintending Engineer of 3 years' administrative service. Considering that many deserving officers cannot be found vacancies in administrative appointments before they are superannuated a rule seems reasonable that men who would have received such appointments if vacant, and have always been recommended as fit for them, should get an extra pension of, say, £500 per annum. With these improvements

it might fairly be said that the Imperial P.W.D. service would have every reason to be happy and contented.

71,363. (VIIA.) **Limitations in the Employment of Non-Europeans.**—The necessity under existing rules of non-Europeans having to go to England for appointment to the Imperial Service is certainly a limitation, as few can afford the expense, but while as at present a large proportion of appointments must be made from England it is unavoidable, and the advantages of Eurocan education (apart from mere technical training) are so great that it is worth while retaining.

71,364. (VIIB.) **Division of Services into Imperial and Provincial.**—This division has been a most unfortunate and lamentable mistake, and it is chiefly to represent the urgency of its early abolition that I am proposing to give evidence. It will be more convenient to go into the subject in detail later, when considering the general case of the Provincial Service.

71,365. (VIII.) **Relations of the Service with the Indian Civil Service and other Services.**—In all the Provinces in which I have worked these are satisfactory. There was some friction I believe in the Upper Provinces and Bengal before District Board Engineers were instituted.

71,366. (IX.) **Other Points.**—I have no Special remarks to make on the Imperial Service beyond those given above.

(*B.*) *THE PROVINCIAL SERVICE.*

71,367. When I joined the P.W.D. in 1871 and for many years afterwards till 1889, the men appointed in India including those trained at Rurki and the other Engineering Colleges received after training and probation, practically the same rates of pay as all the other Civilian Engineers. The Military men from the Staff Corps and Royal Engineers then a larger proportion than now, received certain extra Staff and other allowances which was a legitimate grievance to the Coopers Hill and other Civilian Engineers, and a "Civil Engineers Association" was got up with the special object of removing this anomaly. It was joined by many of the Indian appointed men and the main text on which it preached for years was the "same work, same pay." No man who joined that Association can consistently do anything but acknowledge the injustice of a Provincial Service, in which the Indian appointed men while doing exactly the same work and on the same lists for promotion, receive only two-thirds of the pay ,while so far as the Europeans and Anglo-Indians are concerned, they have to live on the same scale of expenditure. The Indian College Engineers' Association is now making an able representation on the history of the Provincial Service in which its genesis and the misapprehensions on which its institution was founded, and the alleged broken promises and injustice done, are fully described. I do not propose therefore to go into such details but to confine myself to the refutation of the fundamental error which led to the Government of India taking action in the matter.

(2) The Provincial Service in the Public Works Department was instituted on the recommendation of the Public Services Commission of 1885, which having laid down very good reasons for such a service in various other Departments, did not realise that in this case the circumstances were entirely dissimilar. They founded their recommendation on the ground of the "superior scientific education" of the men appointed from England: and show by their arguments, what I am obliged to call "the most unfathomable ignorance" of an Engineer's real duties, and of what the "scientific education" of a young Engineer, whether in Europe or India, really amounts to. I am aware of the objections to using too strong language, and of its detrimental effect on impartial judges if it is proved to be exaggerated and unreasonable, but I believe in this instance it can be shown beyond doubt that no terms can be too strong to characterise the gross misapprehension on which a Commission of able men made their recommendation, and it is still more amazing that the Government of India with more knowledge and the best intentions should have agreed to and acted on it. It is almost incredible that it should have been so, but so it was as I shall proceed to show.

(3) On referring to paragraph 119 of the Commission's report it will be seen that it is mentioned as a terrible thing that a Coopers Hill man should be condemned to labour on works "within the capability of men of an inferior standard of education" and be kept for 15 years "*making bricks and lime and putting them together*"! To anyone who knows anything of an Engineer's duties that is a terse and comprehensive description of Engineering work everywhere. Similarly, the Commission say with perhaps some truth that "some of the operations of the Department require the highest skill and training obtainable in England, and for control of a great department, qualifications are wanted which are not at present attainable in this country" and *then they proceed to argue that the men "from Chatham and Coopers Hill receiving a higher standard of professional education than the best Indian Colleges are capable of affording,"* are capable of carrying out the aforesaid operations requiring the highest skill and training obtainable in England, while the Indian trained men are only good enough for "the ordinary work of the Department." Now could anything show more extraordinary ignorance of what a young Engineer's professional education really means and amounts to. The fact that "some of the operations of the Department require the highest skill and training obtainable in England" may be a very good reason for importing competent experts in such operations, but that the skill and training acquired at Chatham or Coopers Hill should make any difference for such purposes from that acquired at Rurki or elsewhere, is obviously a statement that proves a complete ignorance of the subject. In either case, the Coopers Hill man or the Rurki man or any young Engineer starting in life, however highly educated professionally, can only have a theoretical knowledge of the first principles of Engineering. One may be slightly better in higher mathematics, and another have a more thorough knowledge of surveying, but both are *beginning their professioanl education* by training in practical work. Neither will be fit for "operations requiring the highest skill" or the "control of a great Department" till after many years of experience, and there is not the smallest reason why one should then be more fit for these than the other if they are men of equal intelligence and practical ability.

(4) Now as a matter of fact I, who have had hundreds of young engineers passing through my hands from all sources, can certify that while the average Rurki man was not perhaps so good in higher mathematics or applied mechanics, he knew quite enough of these subjects to do such work as he would be caled on to carry out in practice, and on the other hand he was a much more thoroughly trained Surveyor, and his knowledge of the language and of Indian men and methods gave him an actual initial advantage. By the time the Rurki man rose to be an Assistant Engineer, 2nd grade, he had had some 2½ to 3 years practical experience and was a long way ahead in usefulness of the newly arrived Coopers Hill man who joined in that grade and on the same pay. These are facts that no experienced and impartial Engineer in India can deny, and that the Rurki man became as fit for operations requiring high skill, and control of a Department as anybody else is abundantly proved by the actual performances of the Rurki men who joined the Department in my time and for some years after, until the institution of the Provincial Service made it no longer attractive to the best men educated in India.

(5) I have made out very carefully a list of all the Engineers with whom I have during my 40 years' service come into sufficiently close contact to enable me to form a judgment as to their efficiency as Engineers. These number in all more than 450 men of all ranks and from all sources made up as follows:—

(*a*)	Royal Engineers	59
(*b*)	Staff Corps	12
(*c*)	Engineers under covenant (5 years)	17
(*d*)	Stanley Engineers	32
(*e*)	Miscellaneous appointments in India	30
(*f*)	Rurki men	117
(*g*)	Coopers Hill, and since	142
(*h*)	Temporary Engineers	50
	Total ...	459

All these are men with, or near, whom, I have worked and I give my personal opinion founded on actual experience. The figures showing that the number of Rurki men who actually rose to administrative rank was as large a proportion as in any other service, will be available no doubt from other sources, but as they might be considered the exceptions. I have gone carefully through all the men I have known well enough to judge, and divided them into three classes —above average, average, and under average, with the following results:—

—	Above average per cent.	Average per cent.	Under average per cent.
(*a*) Royal Engineers	53	42	5
(*b*) Staff Corps	17	50	33
(*c*) Engineers under 5 years covenant.	58	29	13
(*d*) Stanley Engineers... ...	25	55	20
(*e*) Miscellaneous appointments in India.	27	47	26
(*f*) Rurki and Indian College men.	34	54	12
(*g*) Coopers Hill, and since ...	33	57	10
(*h*) Temporary Engineers ...	8	84	8

(6) It is not pretended that these figures are exactly accurate, and such are not possible, but they have been got out with an earnest endeavour at absolute impartiality. I am willing to admit all kinds of qualifications, which might affect the percentages to a certain extent, but I believe there can be no doubt that the Rurki Engineers who joined the Public Works Department while the service was considered worth entering, were as good for all practical purposes as the man from any other source, and had an equal proportion of men above the average fit for administrative, or exceptionally difficult executive posts. I think I have shown good grounds at any rate for my contention that the institution of the Provincial Service in the Public Works Department was founded on a complete misapprehension by the Public Service Commission of what an Engineer's duties are and what his education really means, also that as a matter of fact the men turned out from Rurki in the years before 1889 and for some years after were as competent, and deserving of the same pay, as those recruited from any other source.

(7) I have now to urge the strong reasons that exist for my opinion that the present state of things is in the interests of the Government intolerable and disastrous, and calls for very early and drastic reforms. The Public Service Commission in making their recommendations had the excellent intention of appeasing the discontent that existed amongst the Indian appointed men, who complained that, though doing the same work and drawing the same pay, they were at a great disadvantage in the matter of leave and pension rules. *This discontent they proposed to allay by the very topsy turvy expedient of reducing the pay also* while they continued to do the same work. In practice, as might have been foreseen, there has been since twenty times the amount of discontent that existed previously, and on very solid grounds. There was an idea at the time that the Provincial men could be kept, by themselves in certain unimportant divisions comprising "ordinary works" not requiring the "highest skill," but as any practical man could have foretold this was found to be quite unworkable. In practice, for important works the competent men must be selected whatever their origin, and in any large service any attempt to restrict the freedom of selection for vacancies that occur, would lead to a disorganisation of staff from frequent transfers that would be fatal to efficient management. No attempt is now made therefore to separate the sheep from the goats. They work together indiscriminately, with the result of anomalies of all kinds which make a contented Provincial Service man an impossibility. Very often a Provincial Executive Engineer has Assistant Engineers under his orders drawing much higher pay (I have known a case where the Assistant Engineer drew nearly twice the pay of his superior officer), and even when working together as Assistant or Executive Engineers the man drawing the smaller pay for exactly the same work (while obliged to live on exactly the same scale of expenses) cannot be expected to do the contented and willing service which can alone be efficient service. It is argued that he entered the service with open eyes as to the conditions and ought to have known what to expect, but it is a weak argument. Youngsters of the age at which most men join do not think of such matters, cannot realise what the distinction will mean in practice, and find themselves in positions in which no man with self-respect can be satisfied.

(8) There is another argument, perhaps the most powerful of all, against the existence of the present system of a superior service on subordinates' pay. It is said by critics of the Indian appointed men that they have deteriorated in class of late years from the men who used to go to Rurki some years ago. I am not aware that there has so far been any very marked deterioration, though no doubt the most brilliant of the Indian educated boys are not sent there as they used to be, but with the prospects as bad as they are now it cannot be questioned that such deterioration is in time inevitable, and that there is grave danger of coming down sooner or later to men of inferior type with moral standards that unfit them for positions of trust. It is a delicate matter, but needs putting quite plainly. The Public Works is a spending Department, the officers of which control in every detail an enormous cash expenditure, and it is a necessity that they should be above suspicion as to their absolute honesty. This has been ensured on the whole so far, but what will happen when badly paid and discontented men coming from an inferior class find themselves in such positions exposed to the strongest temptations, anybody conversant with Indian standards knows quite well, and it is not necessary to go into further detail.

(9) No stronger reason can exist than those given above for an immediate reform of the present system of appointment in India to the higher ranks of the Public Works Department but there are farther strong considerations of policy against barring the doors of the higher service against indigenous talent of the right kind. There are, it is true, comparatively few educated Indians at present to whom a service presents itself as attractive in which many hardships and physical discomforts have to be encountered daily and much patient drudgery called for in the lower grades. The Indian Engineers of the future, and very brilliant ones, will be found amongst the artificer castes, trained to such work for generations, but there are yet few of these sufficiently advanced in English education to be successful in College competitions. The members of the large domiciled community however, showed themselves, while appointments worth having were available, to be particularly adapted for this profession and successful in its practice, and as an outlet for their best men it will be in every way an advantage to the State to restore the conditions under which the Indian Colleges sent out so many brilliant Engineers in the seventies and eighties. In this connection the subject is acknowledged to present certain difficulties which will be considered later under the head of "*conditions of recruitment.*" I hope I have shown conclusively above, the evils of the Provincial system for the Public Works Department as at present existing, and its inevitable result if continued on the same lines, in an inefficient and untrustworthy service. Radical alterations are urgently necessary and I will proceed to indicate briefly what I suggest as advisable. But before proceeding farther I should like to explain that I have not forgotten that the Commission mentioned as reasons for the distinctions they recommended, not only the illusory "higher scientific education" obtainable in Europe but the advantages of "general English education and training," which I am quite ready to admit as most valuable in forming energetic and strong characters. I have therefore in my remarks above on what is now called the Imperial Service, proposed that half the recruitment should continue to be from England under present conditions. I am also willing to admit that there is something in the argument that the Indian trained Engineer gets his education so much more cheaply, that a difference in the rate of pay has some appear-

ance of plausibility, but it is also clear I think that this difference should apply only to the initial pay for the first two or three years, by which time the man who has served his probation and practical training successfully has surely washed out the score. My recommendations for reform are therefore as follows:—*First.*—The name of the service should be altered; "Provincial Service" is in other Departments the description of a strictly subordinate service in which *all the members join and work as subordinates* under a superior class of officers, but it is not applicable to Public Works Engineers who join as officers and work as such with all the duties and responsibilities of other officers of the Department. *Secondly.*—My recommendation is in short, that we should return to the state of things substantially, that existed in 1871 when I joined the Department.

(10) The Indian appointed Engineer would join on Rs. 250 instead of the Rs. 350 drawn to start with by the English trained men. The nominal "apprenticeship" of the Rurki man would be abolished as meaningless and generally ignored in practice, and no more necessary in his case than in that of the English trained man, probably less necessary owing to his knowledge of the language and of Indian ways and methods. After probation and training on works for say two years, as described above under paragraph 71,358, both men would be put on the same footing and the same pay. At any rate it is absolutely necessary that after Executive Engineer's rank is reached there should be no distinction whatever in emoluments. We should then get rid of the anomalies that at present exist and cause heart-burnings and humiliations fatal to efficient service.

71,368. (I.) **Method of Recruitment.**—The only really satisfactory system, apart from a Training College like Coopers Hill is that adopted lately for the "Imperial" P.W.D. service, of careful selection from men who have passed a qualifying examination, and there is no doubt that selection by competitive examination is the worst possible system, and more so especially in India, where the classes that shine most in the schools are those least fitted for hard outdoor work, which needs specially energy and perseverance and practical ability. If any workable system could be devised of nomination from schools and colleges for a qualifying examination, and a farther selection after personal interview by a competent and impartial Board of Examiners, it would be an ideal arrangement; but I am aware that in India there are almost insuperable difficulties in the way of any such arrangement. However, absolutely impartial the selectors might be in fact, there would be bitter complaints of unfairness to certain races, or religions, or castes, leading to constant appeals, and I am afraid some system of competitive examination as at present is unavoidable. It is, however, possible to limit to some extent the entrance into the Service of the more unfit, by insisting on a searching medical examination with particular attention to physical activity and hardiness before applicants are allowed to go for the entrance examinations of the Indian Engineering Colleges, and to give marks in the passing out examinations, for riding and proficiency in gymnastics, and games which tend to activity of mind and body and a sound physique.

71,369. (II.) **Probation and Training** would be as proposed above for the Imperial Service.

71,370. (IV.) **Conditions of Salary.**—It has been explained above that the pay must be the same as for corresponding grades of the present "Imperial Service," at any rate after the rank of Executive engineers has been attained. I am quite willing to admit that for Natives of India *living on the Indian scale* the European scale of pay is high, if we compare the respective necessary living expenses, but in this Department at any rate we have to remember that a large proportion of the officers are domiciled Europeans and Anglo-Indians who do, and to preserve their position *must*, live on the European scale, and it is also desirable that educated Indians should be encouraged to adopt European manners and habits of life. A perfectly fair arrangement theoretically would be to have two scales of pay, one for all Indian appointed officers who live on the European scale and a lower one for those who live in native style, and it would have excellent results in bringing about an approximation to a common scale of the habits of life, which is necessary to allow of free social intercourse and friendship between the Europeans and non-Europeans, without which it will be impossible to quite remove racial feelings and jealousies.

I do not think, however, that under present circumstances any such differentiation is possible, and the only fair solution is to give all officers doing the same work the same rates of pay.

71,371. (V.) **Conditions of Leave and (VI.) Conditions of Pension.**—The appointments made in India are meant for Indians and members of the domiciled community, and it will be no grievance to any of them if they have the same rules as the "Uncovenanted Service" generally, though they should of course have a right to any extra pensions paid to Superintending and Chief Engineers.

71,372. (VII.) **Limitation in the Employment of Non-Europeans.**—For appointments made in India there can be no limitation of non-Europeans, but it is arguable that there should be limitations, perhaps, excluding Europeans not members of the domiciled community, as there would be otherwise a danger of men educated in Europe coming out specially to compete in the entrance examinations, when the service after the improvements proposed is made tempting enough to attract them. (This actually happened in 1871-72). Amongst Indians, and domiciled Europeans and Anglo-Indians, who are fairly eligible for admission to the Indian Engineering Colleges, it is not I am afraid possible to lay down any proportions as to the numbers in which the races and castes are to be admitted respectively. The better educated members of the domiciled community have proved themselves specially suited for such work, and it is also true that Engineering as a profession does not attract or suit the class of Indians who are at present the most highly educated, and most likely to be successful in competitive examinations. It would therefore certainly tend to the efficiency of the service if at least half the appointments were reserved for the domiciled community, and stated proportions also reserved for Mahomedans and the Artificer classes generally, who are the best practical men though at present backward in English education, but it is not possible in practice to make such reservations and all will have to take their chance equally at the competitive examinations.

In closing my remarks on the Provincial Service I beg to be excused for repeating that I have made no mention of the various other strong arguments against it that may be drawn from its history, of broken pledges, and alleged injustice and harsh treatment, &c., &c., but have been constrained by my deep interest in the Public Works Department to give my reasons founded on long personal experience for believing that reforms on the lines I have recommended are urgently called for in the interests of the State, as a mere matter of expediency.

TEMPORARY ENGINEERS.

71,373. The Commission will know all about this service and it is not necessary for me to go into great detail. The Temporary Engineers are men with sufficient professional training, or knowledge obtained from practical experience, to carry out Engineering works. They are engaged as non-pensionable officers subject to dismissal at a month's notice, but engagements are generally for a year at a time. Towards the end of this year every temporary man is in a state of very uncomfortable suspense as to whether his services will be retained or not. There is no regular system of promotion and temporary men have at present little or no prospect of attaining any rank or pay, above that of Assistant Engineer on Rs. 600 a month. As a rule, so far as is possible under these conditions, temporary men are treated with a certain amount of consideration and have had a tolerably contented existence and a fair prospect of continuous employment so long as their work is satisfactory, but they are entirely at the mercy of superior officers who are sometimes prejudiced and inconsiderate, and many have suffered from very unjustifiable treatment. In a recent case, on one State Railway, thirteen Temporary Engineers were suddenly served with a

month's notice for no fault, but because this number of permanent men was supposed to be coming to it, and room had to be made for them. In the end, as might have been foreseen, nearly all of the Temporary Engineers were either retained or re-appointed, but the disturbance of the work of the Railway, while half the staff was on transfer and retransfer was indescribable, and the shock to the men of the sudden dismissal and anxiety about their future, was such as no men who are doing very responsible work, and supposed to have some self-respect, can be subjected to without deplorable results.

The Temporary Engineers' service is as a matter of fact, if reasonably dealt with, a very valuable and useful part of the Department. The number of officers required from time to time varies so much that to appoint a sufficient number of permanent pensionable men for busy years leads to a surplus in slacker times of a very expensive staff for whom suitable employment cannot be provided. The existence of a staff of competent non-pensionable men, whose numbers can be adapted to requirements gives a most useful amount of flexibility in the Establishment arrangements, and coupled with the fact that every temporary man is necessarily a competent man (as his services would not otherwise be retained) has led, especially in the Irrigation and Railway Departments, to the employment of a large number of very useful men, with satisfactory results in efficiency of work and economy in establishment charges. It is obvious that such a valuable body of men should be cherished and encouraged in every way, but there are hardships and disabilities in the service, as briefly referred to above, which need to be put right if there is not to be the deterioration in quality described in my remarks on the Provincial Service. No men with self-respect will stay in it, and we shall get a lower class of men who cannot be trusted.

The points that require attention are:—

(*a*) The scale of pay.

(*b*) Eligibility of promotion to higher rank than Assistant Engineer.

(*c*) Less uncertainty of tenure of appointment.

(*d*) Better leave rules.

(*e*) A provident fund.

On these my proposals are as follows:—

(*a*) *Scale of pay.*—Considering that the service is non-pensionable, the scale of pay should be at least that of the permanent service. The starting pay should be Rs. 250 per mensem for the first year and Rs. 350 after that for young men beginning work. For older and experienced Engineers the pay should be in accordance with qualifications and experience at the time of appointment. There should be a recognized scale for increase of pay of competent men of, say, Rs. 100 every three years till Rs. 600 is reached.

(*b*) *Elegibility for promotion* to higher rank than Assistant Engineer. This should be allowed in the case of thoroughly efficient men, and there should be possibility of promotion in exceptional cases to the permanent service. Such promotions have been made in the past with excellent results. They were stopped as a grievance to the Provincial Service, but will be so no longer when that Service is put on a better footing. The restriction at present existing to the maximum pay of an Assistant Engineer is fatal to obtaining or retaining the services of the best men.

(*c*) *Greater security of tenure.*—To preserve the flexibility, which is the *raison d'etre* of the Temporary Service there must be a retention of the right to reduce the numbers on due notice, but this can easily be arranged systematically without causing undue anxiety or sudden surprises. The employment at one month's notice should be retained for the first year's service which will be on probation, but after that where service is approved the terms should be six months' notice at least, to allow a man time to look for another job, and it should be understood that reductions will be made from the latest joined men, and that these will have the first claim to re-appointment when numbers are again increased.

(*d*) *Leave rules* should be in accordance with the uncovenanted service rules generally, for men of the same pay in the permanent service, including a right to furlough when due.

(*e*) The Civil Engineers' or Railway Provident Funds should be open to Temporary Engineers in all cases.

During my service as Engineer-in-Chief in Burma and on the North-Western Railway, I was able to work the Temporary Engineer Establishment much on these lines, with, I believe, great success in getting good work done by a willing and zealous staff, and I see no reason why it should not be done throughout the Public Works Department. There is, I believe, no alternative between improving the Temporary Engineer rules on the lines indicated above, or abolishing altogether a service which must become under its recent treatment a mere refuge for the destitute.

I shall be glad to give any further information that may be called for, or to appear before the Commission when the subject is taken up and answer any questions that may be asked.

Supplementary Written Statement.

71,374.—(1) When drawing up the written statement submitted to the Royal Public Service Commission I had not seen the statement sent in by the Civil Engineers' Association.*

(2) After reading that very able, and in most respects, moderate representation, I wish to make the following supplementary remarks.

(3) In my memorandum I find that I underrated the increase in the rates of pension that would be justifiable in the case of the Imperial Engineer Service, and agree that something more nearly approaching what is asked for of the Association is called for to put the Public Works Department men on an equal footing with other departments manned by imported officials.

(4) Also I forgot that the leave rules demand a similar improvement.

(5) I consider that the advantages of *technical training in Europe* (as apart from *education*) have been very much exaggerated, and as far as practical work is concerned (excepting Specialist subjects) I believe too much experience under English conditions is a positive disadvantage. The duties of Engineers in England and India are fundamentally different, and so are the circumstances under which the work is carried out. I do not therefore believe in the necessity for Indian appointed men being sent to Europe for practical training. For the work they have to do, training on large works in India is much more suitable.

(6) I do not admit that the technical training at the Indian Colleges is very inferior as has been made out by some people. It is no doubt capable of improvement, but *just as good for practical purposes as the European training* at Cooper's Hill or elsewhere.

(7) Also I do not admit that European standards of work are very much superior to those in vogue in good practice in India, which are as good, as a rule, as possible under the circumstances. I have made very interesting inspections of works in Europe but gathered very little, if anything, that has been of practical use in this country.

(8) The question of a "foreign service allowance" being due to imported officers in addition to salaries paid to locally appointed men has been raised. It is undoubtedly a fair and reasonable claim, and can be met adequately by improved leave and pension rules, without any differentiation in actual salaries while on duty.

(9) *A period of probation for imported* men is a very important matter under the new system of selection without the knowledge of character given by three years' residence in a College. One year however is quite a sufficient period in which to judge of a man's qualifications for service in India. In practice, whatever the theory, no man would be sent away for anything but faults of temperament and conduct which entirely unfit him for employment in India and these become evident in a very short time.

* *Vide* paragraphs 72,155–63.

Mr. F. R. Bagley called and examined.

71,375. (*Chairman.*) The witness said he was a retired Chief Engineer of the Public Works Department, and now occupied the position of Chief Engineer of Construction with the Southern Punjab Railway. He entered Government Service in the year 1871 from Rurki College. Railway Engineering demanded no higher theoretical training than was needed for work on buildings, roads and irrigation. It required, however, certain qualities of promptness, and readiness of resource.

71,376. His written statement was entirely directed to a general criticism of the present policy in regard to the Provincial Service, and the employment of temporary Engineers. He recommended the abolition of the Provincial Service as it at present existed, and the establishment of a superior Engineering Service. He thought on the whole the supply of suitable material in India would be sufficient to furnish 50 per cent. of the superior Service. He would not suggest such an increase immediately, but he would spread it over three or four years.

71,377. He considered there were positive advantages in recruiting a definite proportion of men who had been educated in England as distinguished from men who had been educated in India. It was a matter of character. Under his scheme openings for the subordinate Service would be the same as at present; the best men of the subordinate Service should be promoted into the superior Service, and ought to get some allowance for the fact that they would under these circumstances enter very much later in life than their colleagues. He would give a man, so promoted, four or five years seniority, which had been the practice in regard to the Royal Engineers, who obtained 2½ years seniority. He admitted that such a practice had been a source of dissatisfaction, but he did not think that dissatisfaction counted for very much. He agreed, however, that this proposal would rather accentuate that feeling of dissatisfaction.

71,378. He was not aware that there was any very great difference in the quality of candidates now available in the Indian Engineering colleges as compared to what it used to be, but he believed from what he had seen and heard in the last few days that the former good class of men were not attracted by the Provincial Service terms, and if there was a difference, that was the reason for it. He thought if better terms were offered, a better class of men would be obtained.

71,379. Technical education, as distinguished on the one hand from general education, and, on the other, from practical experience, counted in his opinion for comparatively little. It was necessary to have a certain amount of technical education as a foundation, but having got that it was entirely a matter of practical experience and of character.

71,380. The training which was at present being given in Rurki included he thought, a sufficient amount of practical experience in surveying, but when he was at Rurki the training, apart from that subject, was practically all theoretical. The year's practical training after passing out of Rurki, was, in his time, an absolute farce. The way to give a man the best practical training was to put him in charge of work. In the old days students from Rurki were at once made Sub-Divisional officers, and that had been the practice up to quite recently. The attention given to such men varied a great deal according to the officer they were under; in other words, the practical training depended almost entirely on the officer.

71,381. He would not alter the present method of recruitment in England. He desired to say that he thought the idea of having another college like Cooper's Hill was quite illusory. Such a college would not produce a better social class; it would produce exactly the same men as at the present time were being produced. He thought three years in a college was a tremendous advantage to a man, but whether it was worth while starting a college for that sole purpose was, he thought, open to doubt. He was acquainted with one or two engineering colleges in Great Britain.

71,382. He would like to reserve a certain proportion of vacancies for the different classes in India, but he was afraid that was quite impracticable.

71,383. With regard to the question as to the proportion of vacancies to be allotted to each of the Indian engineering colleges, the witness thought the best method would be to give a certain number of appointments in proportion to the Public Works Establishments of the particular Provinces.

71,384. It would be in some respects better to have a central college, but he did not think such was called for at the present moment. He thought the technical education given in all the Indian engineering colleges was about on an equality He did not think there was any necessity for concentrating the course of training for the superior posts in one central college. For present purposes the colleges as they existed now were, he thought, quite satisfactory.

71,385. To a certain extent he favoured the continuance of recruitments from the Royal Engineers, but he thought such recruitment had been rather overdone. If a war suddenly broke out, and the Royal Engineer officers were all called away, it would upset the whole Department. Looked at from the point of view of a reserve, it was very important that Royal Engineers should be selected to the service.

71,386. With reference to temporary engineers, he urged that such officers should enjoy better terms than they enjoyed at the present time. He thought a scheme to restrict temporary engineers to speecific constructional work would be very difficult to carry out. There was a tremendous fluctuation in the demand for constructional work. He considered temporary engineers should be eligible for promotion to the higher ranks but he agreed, if they were, there would be a certain legitimate grievance on the part of the Service. That, however, was one of the difficulties which could not be helped; the men would have to grin and bear it. He could see no other way out of the difficulty. He considered that as the Service of temporary engineers was a non-pensionable one, the scale of pay should be rather more than that of the permanent service. He also suggested that all officers of the superior service should get the same scale of pay, certainly after the grade of Executive engineer had been reached, and preferably after the end of two years' probation. He recognised the necessity of regarding the European in India as entitled to a higher scale of pay, but he proposed to mark the difference in the leave and pension rules. All the present discontent arose on account of different pay being given to men who were doing the same work. He would leave the pension rules and leave rules as they were for the Indian Service generally, and would allow the European in India to have preferential treatment in these two respects. He did not think the Service would regard such an arrangement as being quite satisfactory, but there was no serious objection to it. Anyhow the lesser of the two evils was to give a preference in leave and pension rather than to give it in pay.

71,387. Engineers on the Southern Punjab Railway were recruited chiefly in India. When he could do so, he borrowed permanent engineers from the Government. He desired to say that the duties of an engineer in England and the duties of an engineer in India were quite different, and that a man who had had a long experience in England was almost unfitted for duty in India. In England an engineer laid out the work and supervised it, but it was the contractor who was responsible for making the whole of the arrangements; whereas in India there were no such contractors. The Indian contractor was simply a labour agent, and the engineer had to do everything in connection with the work. He thought two or three years' experience of Indian railway consruction would benefit a man to a considerably greater extent than any experience on English railways. The suggestion, that the permanent cadre of the State Railways should be fixed in accordance with the normal rather than the minimum requirements, and that in lean years there would be no difficulty in lending out temporary engineers to companies, was an entirely illusory one, as the relief obtained thereby

could be only occasional and accidental. The work of the companies fluctuated just as much as the work of the Government. Then again, the Companies' work had to be done, and the Government could not lend a man to a Company and then take him away whenever they wanted. If, however, such a scheme was adopted, it would be necessary to lay down a certain programme for the Companies from which the number of Government men could be calculated. That would simply mean an addition to cadre with its usual difficulties and be no relief at all for temporary blocks.

71,388. (*Sir Murray Hammick.*) If 50 per cent. of the recruitment to the Imperial Service was allowed to Indian colleges, the witness would suggest the discontinuance of the rule under which 10 per cent. of the vacancies filled in England were reserved to Indians. If half the vacancies were filled in India he thought the Anglo-Indian and domiciled European would re-establish himself in the Indian colleges, and obtain as many appointments in the Service as he used to do.

71,389. Why, he said, the so-called practical experience in England was generally a farce, was that a man who went in for such a course could either learn or not, as he chose. If a man went to a railway, or some Engineering Works to obtain the practical training, it was nobody's business to look after him. If a man chose to learn, he could learn a great deal, but if he did not, he need not learn anything. The witness did not agree with the statement which had been made at the last Educational Congress of Engineers held in England some years ago, that the men who came from colleges were absolutely useless without a long course of practical experience in shops. His remarks applied only to Civil Engineering, and had no reference to mechanical engineering. He did not agree that a man in an Engineering Works learned to do the work as the workman did it, and was therefore very superior to the man who came direct from college to the Indian railway. All the circumstances in England were so entirely different—the workmen, the materials and the climate and methods of work.

71,390. (*Mr. Abdur Rahim.*) The reason why he suggested that the 50 per cent. recruitment in India should be worked up to gradually, was because it would take time for men to change their system of education. The men who were not going to Rurki at present and who wanted to become Doctors or Lawyers, would have to change their plans. They would not be all got in at once. In the witness's time, the system was entrance by competitive examination, and appointments were given on the results of competitive examination. He believed at the present time they entered 20 Engineer students in every year by competition. The first six obtained appointments, and the remainder who qualified were given diplomas.

71,391. He thought in India it was impracticable to have anything but a system of competitive examination. He would much rather have a selection of qualified persons, but he was afraid there would be so many complaints with regard to the selection. There would be accusations of favouritism being shewn to one race or religion or another. He thought on the whole the selection in England was the right plan. His experience of men selected there had been satisfactory.

71,392. (*Mr. Madge.*) The rule that incompetent Temporary Engineers would be discharged with a month's notice had been fairly strictly carried out, and therefore the majority of the remaining Temporary Engineers were fairly good men.

71,393. (*Mr. Fisher.*) He did not think there would be room for an intermediate service between the Subordinate Service and the Imperial Service. It has been often proposed and found impracticable.

71,394. (*Mr. Sly.*) There was nothing in the character of Railway Engineering which made it necessary to adopt a different method of recruitment from that by which Civil Engineers were obtained for other branches of the Public Works Department. He thought if better terms were given, a better class of men would be obtained in India.

71,395. The proposals that officers recruited in England should receive the same pay as the Imperial Staff, but that there should be some difference in the leave and pension rules was in effect a proposal to revert to the position which existed before 1887, and which was described by the last Public Services Commission as being very faulty and causing friction and jealousy; but the witness thought the proposal had been wrongly condemned, and that friction and jealousy only existed to a comparatively slight extent. He admitted, however, that there was very serious friction at the present time, but that was, he considered, on account of the differences in pay.

71,396. (*Mr. Gokhale.*) The witness thought the training at present being given in the Indian colleges was quite sufficient. He was not aware of any very serious defects; he thought the men turned out by such colleges were good enough for all practical purposes. He was of the opinion that his figure of 50 per cent. of Indians to be recruited to the Service could be increased to 70 per cent. at some time in the future many years hence, but he considered there was such a difference in the efficiency of men recruited in England and the men recruited in India as made it necessary that there should always be 30 per cent. of Eurropean officers as a minimum.

71,397. He thought that on the whole it would reduce to a minimum the present sense of unfair and unequal treatment if the only differences made were in regard to leave and pension.

71,398. (*Mr. Chaubal.*) It was true that every railway had large workshops attached to it, which would be capable of affording training.

71,399. (*Sir Theodore Morison.*) If the witness's standard of 70 per cent. recruited from the India was worked up to, he would suggest the Imperial scale of pay, so long as any men were brought out from England. He agreed that the present scale of salaries would be such as would be considered very good in England, but he thought under present circumstances men recruited in India must be paid more than it was necessary to pay men in England. He did not say it was a method he would approve of, but it was unavoidable because there could not be two rates of pay. He considered Government would be repaid in efficiency; and that it would get a better class of men all down the list. When the percentage did reach 70, the question of the salary might be reconsidered; he did not think it would be too late then.

71,400. He agreed there had been a considerable change in social habits; Anglo-Indians sent their children to England to a greater extent than they used to, but that was largely on account of there being no openings in India. He was sure Anglo-Indians would send their children to Rurki if the conditions of service were improved. He did not think they would be beaten in the qualifying examination by Indians, nor did he agree with the suggestion that the educational standard of Indians had risen enormously of late years, and that that of the Anglo-Indians and domiciled Europeans had very much deteriorated.

71,401. (*Sir Murray Hammick.*) There were 14 superior engineers on one line of the Southern Punjab Railway, and 12 on another. On the first line there was only one sub-divisional officer an Indian; three of the rest were Englishmen trained and educated in England; and the remainder were Anglo-Indians who had been also educated in England, or partly in England and partly in India. On the second line there were three first class Asiatic Indian officers, the rest being Europeans.

71,402. (*Mr. Aikman.*) He did not think that the relatively large number of Rurki men who had risen to administrative rank was due to Rurki College having been started very much sooner than Cooper's Hill. He thought if the percentage was taken from the same date as the Cooper's Hill men came out, it would be found just as good.

(The witness withdrew.)

Raj Narayan, Esq., Executive Engineer, United Provinces.

Written Statement relating to the Public Works Department.

71,403. (I.) **Methods of Recruitment.**—The superior posts in the Department are recruited in 5 ways:—

(*a*) by the appointment of Civil Engineers obtained from England,

(*b*) by the appointment of Royal Engineers,

(*c*) by the appointment of successful candidates obtained from the Indian Engineering Colleges,

(*d*) by the appointment to the permanent establishment of Temporary Engineers, howsoever secured, and

(*e*) by the promotion of the Upper Subordinates.

Recruits from England are appointed by a Selection Committee at the India Office without *competition*. The annual recruitment from this source during recent years has averaged 30. It was 15 (from the Cooper's Hill) in 1887. The annual recruitment in India from the Indian Engineering Colleges is only 9. It was also 9 in 1887. This shows that during the last quarter-century the recruitment in India has remained absolutely unchanged, while the English recruitment has *doubled*, in spite of the recommendation of the Public Service Commission of 1886-87, to increase the Indian recruitment. The Commission recommended promotion of Upper Subordinates in *exceptional* cases only, but they are being *regularly* promoted in the ration of 5 to 9 of the directly recruited Indian College Engineers, and claim 36 per cent. of the total Indian recruitment.

The number of Engineer officers in these provinces is 123. It was 126 in 1887. The present number consists of 80 English recruits against only 63 in 1887, and of 43 Indian recruits against as many as 63 in 1887. This is the reverse of what was recommended by the Commission. The number of Royal Engineer officers in this period has practically stood stationary.

The annual recruitment in these provinces is about 3 to 4 from England, and only *one* from Rurki. During this year 5 of the former have been recruited against *one* of the latter. This is not as it should be. In fact it should be the reverse. If this is not possible at present, there should be at least 50 per cent. recruitment from the Indian Colleges. There are special points of qualification, due to place of recruitment, in both, and a service consisting of more than 50 per cent. of the Indian recruitment, cannot but produce not only safe but better results, and will be acceptable to all, for some time to come.

The present method of selection for recruitment in England is faulty and should be discarded for a system of *open* and *unrestricted* competition in which there should be *no racial limit* whatsoever. The Indian Engineering Colleges which are at present *needlessly* closed to Europeans non-resident in India —for no European was ever likely to come to study here, *only to get less pay, leave and pension*—should now be freely thrown open to them, to ensure equal chances to all, and to stimulate further competition, when the Imperial service is again thrown open to students of these colleges.

The subjects of the competitive examination for recruitment in England should at least include all vernacular dialects which should be compulsory for all. The other subjects should be the text books of Indian Civil Engineering, *e.g.*, Irrigation, Architecture, &c., which have been specially compiled in India for Indian standards and practices. The existing system of open competition for admission into the Rurki College, and for admission from the college into the service, is excellent. Those who win the guaranteed appointments after 3 years' hard labour in the college and the 4th year of training on Indian Works, are the pick of Indian intellect, representing all classes of His Majesty's loyal subjects.

Temporary Engineers should not be taken permanently in the same service in which the pick of the Indian and European Colleges are appointed by competition.

Upper Subordinates should not be promoted into this service. They should form a new Provincial service with better status and prospects than they have at present and there might be "listed" or "prize" posts in the cadre of the Indian Engineer service, which may be offered to the most deserving of them.

The number of Engineers, recruited in India up till now, totals about 200, of which half are Indians and half are Anglo-Indians, residing in India. With the abolition of the present Provincial service, the number of both Europeans and Anglo-Indians will probably increase, as many of them will be able to come to India and learn the profession in the country in which it has to be practised, and those who have now to go to England to quality for entering the Imperial service will doubtless remain here. There will thus be no danger of the department being swamped with Indians.

71,404. (II.) **Systems of Training and Probation.**—(A) *Training.*—India, like every other country in the world, has distinctive climatic peculiarities and engineering requirements of its own; *e.g.*, the rainfall here being so precarious, the Irrigation Branch of Engineering has received special attention. The magnitude of our Public works and their success in operation are recognized throughout the world, and the degree of proficiency to which Irrigation Science has been brought in India is not surpassed in any other country. M. Chikoff, a Russian Chief Engineer, is now touring through India to study its canal systems with a view to introduce them in Russian territories. It was from India that several Canal Engineers were sent to Egypt to train rivers and introduce canal irrigation there. It was from India again that only the other day a band of canal Engineers have been sent to the Siam Government to introduce canal systems there. Similar remarks apply to the Architecture, Railways and Waterworks in India. Mr. C. S. R. Palmor, who is a Rurki Engineer, went to Australia where he rose to the Chief Engineer's rank, and was awarded Telford Medal, the blue ribbon, and the Telford Premium for writing papers on Water scheme and Harbour works.

Theory of Engineering in general and its practice in India are two distinct things. The former can be learnt anywhere but the latter must be learnt in India itself. The English recruits, on their arrival in India, are quite new to the country and know nothing about its peoples, languages, ways, and resources. The practice of Indian Engineering still remains to be learnt by them, before they are able to discharge their important duties *efficiently* and *independently*. Their practical training begins on the day of their landing, and most of them take several years to overcome these shortcomings. The average period thus required may be roughly put down at about 5 years. Theoretically in service, they are practically in the school of Indian Works for these years, drawing high scholarships in the form of pay.

The case of the Indian recruits is, however, different. They learn the two subjects side by side, both inside and outside of the class rooms, while for 3 years at the college, and again on works in progress, while undergoing the course of one year's practical training, before appointment to the Department. Specially selected books which refer to the science of Indian Engineering are also prescribed in the course of studies in these colleges, in addition to works on general Engineering. The Indian recruit is thus better fitted for his work immediately on appointment. The system of training in India is very satisfactory, and does not require any change for some time to come. But the system of training for Indian Engineering in England is very inadequate and should be wholly directed to ensure the efficient performance of duties required of an Engineer in India.

The competition in England for appointments in India must be real, the appointments offered in any year not being more than one-third of the number of candidates competing in that year.

(B) *Probation.*—The English recruits should be appointed on one year's probation. Any plea that this is unfair or will deter candidates from England, by reason of the risk of rejection, may be met by the provision of free return passages to rejected proba-

tioners. The Indian recruits should also be appointed on one year's probation. The present rule of sending two successful students,—one from those who win guaranteed appointments, and one from those who do not—to undergo practical training under two different officers, and to select the former if both prove fit, and the latter, only if the former proves unfit and the latter proves fit, is *extremely* unjust. Illustration—The guaranteed number of appointments in 1903, for the Rurki College—*Vide* Calendar for 1912, page 221—was five for the Civil Engineer class. Mr. Wazir Sahai stood 6th, out of a total number of 10 successful candidates of the year. One of the first five proved unfit in the year of training and was rejected. The vacancy thus caused was filled up by the appointment of one who was junior on the list to Mr. Wazir Sahai, simply because the latter did not happen to be posted to the same province to which his junior was fortunate to go. Mr. Wazir Sahai who was senior had equally proved his fitness, but his unjust exclusion was due to the existence of the above rule. His work is, however, so good that he has been kept as a Temporary Engineer for the last 10 years.

The pay during the probationary year for both the English and the Indian recruits should be equal and should equally count towards increments, leave and pension.

If unfavourable reports are received on the first year's work, a second year's trial should be given under a different officer before finally rejecting the probationer, and, in case of an imported Engineer before sending him back at State expense.

71,405. **(III.) Conditions of Service.**—The conditions of service should be the same for officers recruited in India and obtained from England, for the Indian Engineer Service. This will remove the present discontent and increase the efficiency of the Department.

The present practice of rarely posting English recruits under Indian-trained Engineers should be discontinued. The former can *learn* better under the latter and more rapidly, if he cares to do so. A hollow sense of superiority should not be allowed to take root by this exclusion.

No officer should have his promotions or prospects in service affected by any report or series of reports, which have not been openly, and *in more important cases* judicially, enquired into. The rules lately published in this connection about His Majesty's Army officers, apply with equal, if not greater force, in the case of the Indian Engineer Service.

Temporary Engineers should be rarely employed, and if ever employed should not be given charge of Divisions, in which qualified Assistant Engineers would otherwise be officiating. Those who have already been employed for many years past should either be taken permanently in the service—on a separate list—or discharged.

The proposals, frequently made, for getting reports on seniors by juniors who may be working under them, or for giving Divisional charges by *selection* are calculated to be unfair to Indian-trained Engineers and should by no means be entertained, as the actual carrying out of the recommendations of the Commission is likely to gravitate, as in the past, in favour of Imported Engineers.

The table of precedence should be revised, so as to give Engineers a better official status.

The cadre of permanent Engineers should be revised more frequently than in the past.

The Indian Engineers should be distinguished from other services by the reserved and officially recognized use of the letters "I. E. S." This is already allowed in some departments, *e.g.*, I. C. S. for Indian Civil Service, I. M. S. for Indian Medical Service, and followed in Gazette Notifications.

The importance of this service to the prosperity of India should be more fully recognized by conferring more honours on its deserving members, than has been allowed in the past. Some time back, the Indians held ex-officio honours, viz., Khan Bahadur or Rai Bahadur for Executive Engineers and Khan Sahib or Rai Sahib for Assistant Engineers. This should be restored and a more equitable share of honours as compared with members of the Civil Service should be given to Engineers.

71,406. **(IV.) Conditions of Salary.**—There is a difference in pay between the officers recruited in England and in India for doing the *same* work and bearing the *same* responsibilities, although both remain on the *same* list and are promoted *side by side* in order of seniority. The excess earned by the former, with compound interest at 4 per cent. per annum, under *normal* conditions amounts to as much as Rs. 1,69,748. Distinction is also made in Local allowances which are meant only for specific purposes, that is, as compensation for local disabilities, which exist equally for both classes of officers. The total excess, thus paid to officers obtained from England, *approximately* amounts to two hundred thousand rupees. This produces great resentment among the Indian-trained Engineers. To pay them less for no other reason than that they are Indians is against the highest principles of liberal statesmanship, and tends to demoralize them by intensifying the sense of subjection and reducing the sentiment of a common citizenship. The distinction should, therefore, be obliterated. On page 39 of the Historical Memorandum of the Engineer service of the Public Works Department supplied to me by the Chief Engineer, United Provinces, it is stated that "it is agreed that Engineers of the Imperial and Provincial services should be borne on the same list; but it is felt that the principle laid down in Article 85 of the Civil Service Regulations, is fair and equitable. There is no reason why India should pay the same for the native-born Engineers as the Secretary of State has to offer for selected English Engineers in order to induce them to serve in foreign and distant countries." This is a gross perversion of the meaning of Article 85, Civil Service Regulations. The rule is meant to apply to *both* Europeans and *Indians* alike and aims at preventing officers, specially Europeans, of the Indian Government from spending more time outside India than is absolutely necessary. Any Government can justly make a similar rule in its own country to save wasteful expenditure by its officers in getting detained abroad longer than necessary. If it is *literally* applied, an *Indian* deputed to or detained in Europe on special duty cannot get more than two-thirds of the salary which he would draw, were he on duty in India. This can, therefore, mean that one who serves outside his native land should not get more than two-thirds of what he gets in his native land. If applied to Europeans and Indians serving in India, it can mean that Europeans should get less if they are to serve in India, and Indians serving in India should get more. The Article requires a careful examination in the light of these remarks, before it can be taken as an authority for lesser pay in the case of Indian recruitment. The most important point to remember in this connection is, that the British Empire includes India within its large circle, *exactly* in the same way, as India includes its provinces within its boundaries, or Delhi its streets within its walls, or a family its children within its building, and no argument which tends to differentiate between wages of the subjects of the same King-Emperor for doing the *same* work *within* His Majesty's vast Empire, can be accepted as valid. Correctly speaking there can be no "Imported" or "Exported" officers serving under the same King, if they are His own subjects. If Indians or Englishmen are sent to serve under a foreign Government, Turkey for instance, they can certainly dictate terms, but not otherwise.

The new rule introduced in the reorganisation scheme of 1912, by which an officer cannot draw more than the minimum pay of an Executive Engineer, unless he holds charge of a Division or an equally important charge, will bear very hardly on some officers who may not, for the time being, be under the good grace of any Chief or Superintending Engineer and should be rescinded, except in the case of those officers who have been declared unfit for such charges, on account of faults proved by adequate enquiry. Executive Engineers who cannot be selected for promotion to administrative post for want of vacancy in the latter, should, if otherwise reported on as fully qualified, get special increments counting for pension to compensate them for error in recruitment.

The officers belonging to the Buildings and Roads Branch and the Irrigation Branch are borne on the same gradation list, but it is very difficult for Irrigation officers to get a transfer to the Buildings and Roads Branch, as none from the latter are found willing to exchange with the former, where, admittedly, the climate is malarious, society wanting and expenses on establishment double. As a compensation for this difference, a special allowance should be given to the Irrigation officers, on the following scale:—

Assistant Engineers ... Rs. 100 per mensem.
Executive Engineers ... Rs. 150 per mensem.

The scale of pay of the Indian Engineer service—consisting of both the European and the Indian recruits on equal pay—should be increased proportionately with other important services in India.

71,407. **(V.) Conditions of Leave.**—The conditions of leave of the Indian-trained Engineers should be the same as those of the English recruits. The existing distinction is invidious and should be removed. Great stress is laid on the importance of visiting works in foreign countries, and if equal chances, viz., equal pay and equal leave are refused to the Indian-trained Engineers, they are handicapped in competing with their European contemporaries in this respect, *which is not fair.*

It should be open to every officer to take all the privilege leave, which he has earned, at any time during his service. The existing rule that no privilege leave can be due in excess of three months at a time is unjustifiable, for once earned it is as much due as the officer's pay.

71,408. **(VI.) Conditions of Pension.**—The conditions of pension of the Indian-trained and European-trained Engineers should be the same for both. Under the existing conditions an Indian-trained Chief Engineer will draw *equal* pay to, but *less* pension than, his European-trained confreres. He will further draw *less pension than his own subordinates recruited in England.* It is submitted that it is a universally established principle, that pensions are retiring provisions for specific services rendered to the State, and it is therefore unjust to create or maintain any distinction between persons who have rendered exactly the same services, nor is it expedient to give any cause of dissatisfaction to retired respectable Engineers, in the interests of promoting goodwill for the Government amongst the Indian people and classes generally.

71,409. **(VIIA.) Limitations in the Employment of Non Europeans.**—It is believed that the term "Non-Europeans" *in this head* excludes the Domiciled community in India. Unless expressly stated otherwise, the term has *so far* been used, in this memorandum, to *include* this community. Although the liberal policy *declared* emphatically and repeatedly by Government in the past, has been wholly directed to the further employment of Indians in the *higher* ranks of the service, the *actual practice* has been anything but satisfactory. The *advisers* of Government have always considered that the European element must largely preponderate and have arranged matters in such a way that the Indians have not been given a *fair trial* in the *administrative* grades. No limitations are allowed *in theory*, but Indians are excluded *in practice.* Not a single Indian has yet been tried as a Chief Engineer in these provinces, and an Indian *Christian* has only recently been given an *officiating* chance for the first time as a Superintending Engineer. Similar remarks apply to other provinces also. Rai Bahadurs Ganga Ram and Kanhya Lal, although admittedly superior to many European contemporaries were excluded from the highest rank, simply because they were Indians. Times are, however, changing, and evidently under *instruction* from higher authorities, Indians are now being a little better treated than before. Ten years back there were only a few Indian Executive Engineers in charge of Divisions, but now they are holding such charges more extensively, and *very satisfactorily*, although not as much as is due to them as their fair share. One-fourth of the total number of Divisions in the Buildings and Roads Branch, and one-third in the Irrigation Branch in these provinces are now in charge of Indians. The Chief Engineer of Behar and Orissa is an Indian, the Engineer-in-Chief on the E.B.S. Railway is an Indian, and there are some other Indian Superintending Engineers in other provinces of India. If this policy of justice and fair play continues with increased vigour, Indians will certainly justify the trust which is now being reposed in them.

The number of Engineers in India in 1887 was 1,015, of which only 86 were Indians. The total figures for the whole India have not been available to me. The Railway Branches, as a rule, are very conservative in this respect. On the N.W.R. there are only 10 Indians out of 204 officers in the Traffic, Loco., Engineer, and Accounts Branches, and only 5 Indian Engineers out of 73 Engineers. Excluding the Indian Railways, the figures by provinces are as follows:—

No.	Provinces.	Administrative Ranks.		Executive Engineers.		Assistant Engineers.		Total.
		Europeans.	Indians.	Europeans.	Indians.	Europeans.	Indians.	
1	Bengal	6	1	10	7	16	7	47
2	Bombay	8	1	26	17	39	12	103
3	Madras	9	—	36	11	25	12	93
4	Assam	2	—	8	1	11	1	23
5	Bihar and Orissa ...	7	—	8	8	14	9	46
6	Burma	10	1	39	—	38	—	88
7	Central Provinces ...	5	1	16	7	14	8	51
8	N. W. F. P.	2	—	28	—	7	—	37
9	Punjab	22	—	59	18	46	19	164
10	United Provinces ...	11	—	37	13	46	16	123
	Total	82	4	267	82	256	84	775

Total of Europeans = 605, of Indians = 170.
Indians = 22·5 per cent.

[Note:—If Railways are included, this percentage will fall considerably.]

This statement shows that the percentage of Indians is still very low and especially so in the administrative ranks. A greater pressure from higher authorities is evidently necessary to ensure their being tried on these posts. Considering that Indians have already proved successful in the Accounts, *e.g.*, Mr. Wagle, late Accountant-General, United Provinces; in the Postal, *e.g.*, Mr. Badshah, late Postmaster-General, United Provinces; and in the Public Works, *e.g.*, Rai Annanda Prasad, Sarkar Bahadur, B.C.E., Chief Engineer, Bihar and Orissa, it is no longer necessary or just to assume inferiority in other Indians and to condemn them without giving them a fair trial. Indians in other departments have even been given the highest ranks, such as High Court Judges and Members of Executive Councils, and have amply justified their appointment.

71,410. **(VIIB.) Working of the Existing System of Division of the Service into Imperial and Provincial.**—The Provincial service scheme has entirely failed and it should be abolished with the least possible delay. The alumni of the Indian Colleges should be restored to the superior service, to which they originally belonged, under the name of Indian Engineer Service.

71,411. **(VIII.) Relations of Service with the Indian Civil Service and other Services.**—There is a tendency among the Revenue officers to bring the Public Works officers under their control. This should be discouraged. The general qualifications of the two are nearly on a par and there will be loss of efficiency if the later are in the least subordinated to the former.

There is a great resentment in the department about putting its officers under the Accountant General in drawing salaries and travelling allowances. Up till last year, the Public Works officers used to disburse them direct by means of cheques drawn on treasuries, but now they have to go to the treasury for receiving payment. They draw cheques for payment to contractors, but they cannot draw cheques for paying themselves. This system does not hold in the Punjab. A case has recently occurred in which

the Accountant General deducted Rs. 100 from *an overseer's* salary for an item referring to some very old transaction, of which no details were given to him. The officer had great difficulty in maintaining himself. Delays of months and in some cases even of years and constant worry in getting obvious claims admitted have become a rule, with no useful purpose to the Government. This system should be discontinued. The Accounts Department should continue to do the audit work of the Public Works Department but should not be allowed to bring officers of the Public Works Department under its control in *other* respects.

An amalgamation scheme of the Public Works and Civil accounts has recently been introduced in these provinces, but not in the Punjab. It is felt that the previous system was more efficient for audit of Public Works Accounts, as the Public Works Examiner knew the working of this Department fully. The Accountant General cannot get time for this Department, and there is a tendency to ignore the details of accounts, which is extremely undesirable from considerations of economy.

71,412. (IX.) **Other Points.**—The revenues from this department alone have increased enormously during the last 20 years, but the expenditure on establishment averages 17½ per cent. only, whereas it should not be less than 21½ per cent. The saving of 4 per cent can advantageously be diverted to raising the pay of the Indian College Engineers. The consequent increase in efficiency will far more enhance the revenues and tend to considerable further economy.

Mr. Raj Narayan, called and examined.

71,413. (*Chairman.*) The witness said he was an Executive Engineer employed on the Ganges Canal in the United Provinces. He had been in the service for ten years, having been recruited from Rurki College. The views put forward in the written statement represented the general opinion of the Provincial officers in the United Provinces. He desired to abolish the distinction between Imperial and Provincial branches, and recruit the superior service with uniform conditions of pay, leave and pension. He suggested that 50 per cent. of the officers should be recruited in England and 50 per cent. in India. If such a proposal was carried out, he thought it would be acceptable to all. By "all" he meant all the Indians and Europeans domiciled in India. The Europeans would not be able to say that they had not a British element in the service, and the Indians would not be able to say they were not adequately represented. He would like to see his proposal take effect in the immediate future, and not to be carried out by gradual means. In addition to the recruitment of 50 per cent. in India to the Service, he would allow Indians to compete in England as well, just as he would allow Europeans to compete in India. He would like to include the vernaculars in the subjects for the competitive examinations in England. He did not think if vernaculars were included it would be giving preferential treatment to Indian candidates in the examination. There would be some English subjects also, which would equalise matters. It was true his scheme might involve more than 50 per cent. of Indians, assuming Indians were successful in England, and 50 per cent. were recruited from colleges in India, but Europeans would come to India as soon as they found they could be admitted there into the Imperial Service. If Government found there was an excess of one class over the other, the further recruitment of that particular class could be stopped at 50 per cent. It was a fact that Indian students learnt theoretical and practical engineering side by side. There were big works going on in the Rurki buildings, and a big canal was running near Rurki, and out of college hours, students took notes of such works. During the vacations it was also insisted upon that they must travel throughout India and see works in progress, and take notes of such works. 200 marks were allotted for notes on works in progress. Practical experience went on throughout the course.

71,414. He was of opinion that Indian trained engineers should get Imperial rates of pay, on the ground that officers doing the same work should be paid the same salary. He did not think any consideration should be given to an officer coming from Europe and serving in this country. He did not think the different conditions which might be supposed to obtain in India were any justification for a higher rate of pay. Indians were not employed in England in the Public Works Department, and Europeans were employed in India, evidently for the purpose of keeping up the British element. It was true he suggested in his written statement that an Irrigation officer should get an allowance of Rs. 100 and Rs. 150. He did so on the ground that such an officer was suffering from less happy conditions than his colleagues in the Buildings and Roads branch. He thought that statement was quite consistent with what he had just said with regard to Europeans. The two branches were quite distinct, although they had the same list. Promotions in the Irrigation branch to the administrative rank were made from among the Irrigation officers only. The witness's contention was that just as there was a differentiation between the Public Works and the Civil Service and the Medical Service, similarly there could also be a differentiation between the conditions holding in the Irrigation branch, and those holding in the Buildings and Roads branch.

71,415. He would employ in charges, which could not be filled by Assistants in the Imperial Service, upper subordinate officers, to whom he would give the titles of Deputy Engineers. There might be some difference in the work given to those officers as compared with that given to the Assistants. The Assistants might have charge of important sub-divisions, or remain on special construction, and under subordinates could hold ordinary sub-divisions. He would not suggest that the latter officers should rise beyond charge of sub-divisions except on listed posts; there must be superior officers over them, such as Executive Engineers. They could not do exactly the same work as Assistants. If there were any important charges, the Assistants could be sent to take charge of them, and officers of the newly promoted upper subordinate service could hold ordinary charges. Selections for sub-divisional charges would have to be at the discretion of the officer in charge of the Department.

71,416. (*Sir Theodore Morison.*) Indians recruited direct would have been trained at the various Indian Engineering Colleges, or, it might be, at European Colleges. There would be no objection to the admission of Temporary Engineers in the proposed new service, because it would not be Imperial. He thought the proportion of directly recruited men as compared with the promoted men in this new service should be left to the discretion of the local Governments. Upper subordinate officers with the new status could, he thought, be trusted. Their education was far superior to that of most of the Deputy Collectors. The salary of the upper subordinates recruited in India started at Rs. 100 and rose to Rs. 500. He did not think there was any difficulty in the upper subordinate officers being trained in the same institution as the officers of the Imperial Service.

71,417. (*Mr. Gokhale.*) The witness thought the ideal arrangement would be to have no Europeans in the Service at all; and that if experts were required on any special occasion their pay should be charged to the work concerned.

71,418. Although Indians were as efficient as English officers, he thought it would be wise to have a certain European element in the Service on account of political considerations. Questioned as to what those political considerations were, the witness said that if a Service in which there had been a predominant European element, was suddenly bereft of that element, it would not look nice to the public, as being rather unfair to Europeans. He agreed there would be no danger to British rule by having the Service composed solely of Indians.

71,419. If the bulk of the appointments did go to Indians, he would still object to the scale of the salaries being lowered for the Imperial officers. The

public considered the status of a Department and of its officers according to the scale of pay. If the pay in the Engineering Department was Rs. 500, and in other Departments, because there were Europeans in them, it was Rs. 1,500, the former Department would be considered of very low class. He considered the pay should not be reduced.

71,420. (*Mr. Sly.*) The witness thought that highly educated Indians were attracted more to engineering than to the Provincial Civil Service (even although the latter started at Rs. 250 rising to Rs. 800, and the former from Rs. 100 to Rs. 500), because it was free from evil practices of nomination.

71,421. (*Mr. Fisher.*) The subjects of examination mentioned in the written statement were compulsory for all the students at Rurki. The mathematics which the witness himself had undertaken at Rurki included the Differential Calculus and the Integral Calculus. He did not think there was anything in the argument that the English trained engineer possessed a better mathematical foundation than the Indian trained engineer. He thought the Indian colleges trained to the same standard as English colleges. He had Indian friends who had had an education in some of the Engish Universities, and he thought they were well trained, but Indians trained in India were not inferior to them.

71,422. (*Mr. Madge.*) The witness said he was of opinion that the training at Rurki did not require to be improved at all at present. He was against any scheme for the institution of a single central college for all India, because it would involve a waste of public funds. A great deal of money had already been spent in establishing the four existing colleges. If a central college was established in one particular place it would be difficult for men in the other Provinces to come to it. He thought all the Indian colleges were up to the standard of Rurki, but said he had no personal knowledge of the former.

71,423. Temporary Engineers who had been appointed by Government without any educational qualifications, knew nothing of their work, but there were some valuable Temporary Engineers in the service. It depended upon the method of appointment. Speaking of his own Province, the witness thought those Temporary Engineers who had passed out from Rurki College would be quite fit for admittance into the new Provincial Service which he proposed.

71,424. (*Sir Murray Hammick.*) He did not think it probable that even if the commercial development of India depended largely upon the introduction of foreign capital, the confidence of capitalists would be shaken if any sudden change were made in the control of the Engineering Department. Capitalists had in view the security of the whole of India and not any single Department, and therefore would not mind whether any particular Department was manned by Indians or by Europeans.

71,425. (*Sir Valentine Chirol.*) His argument in favour of paying the same salary to Europeans and Indians was based on the fact that they were all equally employed in the British Empire. He was not aware that the British Government paid a foreign service allowance to British officers in other services when they were sent on duty outside the British Islands, but so far as he knew no such allowance was paid anywhere within the British Empire.

(The witness withdrew.)

At Delhi, Tuesday, 18th November, 1913.

Present:

The Rt. Hon. the LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

The Earl of Ronaldshay, M.P.
Sir Murray Hammick, K.C.S.I., C.I.E.
Sir Theodore Morison, K.C.I.E.
Sir Valentine Chirol.
Mahadev Bhaskar Chaubal, Esq., C.S.I.
Abdur Rahim, Esq.
Walter Culley Madge, Esq., C.I.E.
Frank George Sly, Esq., C.S.I.
Herbert Albert Laurens Fisher, Esq.
James Ramsay Macdonald, Esq., M.P.

And the following Assistant Commissioners:—

D. W. Aikman, Esq., Superintending Engineer, Punjab.
J. W. B. Loughran, Esq., Executive Engineer, Punjab.

R. R. Scott, Esq. (*Joint Secretary*).

M. Nethersole, Esq., Inspector-General of Irrigation, Public Works Department.

Written Statement relating to the Public Works Department.

71426. (I.) **Methods of Recruitment.**—(*a*) *Imperial Service* (1) Speaking generally, the present method of recruitment is satisfactory, but I consider that the Institutions which have the privilege of nominating candidates for appointment by the Selection Committee should be such as ensure a College training as distinct from lecture training and whose degree is recognised by the Institute of Civil Engineers as equivalent to the Institute Examination for entrance to that body. My reason for this proposal is that I consider character and social qualifications as essential for satisfactory service by Europeans in India, and apart from the training in these qualifications which College-life affords, it is only in such Institutions that the Principals have adequate opportunities of making satisfactory selections with reference to these as apart from purely professional qualifications.

(2) I consider that an honours degree, as distinct from a pass degree, at such Institutions, should be an obligatory professional qualification.

(3) In addition, the candidate should be required to have at least one year's practical training on Works in Europe.

(4) I consider it desirable that retired officers of the Indian Service should form a majority of the Selection Committee.

(*b*) *Provincial Service.*—The present methods of recruitment through the Indian Engineering Colleges appear to me to be suitable. But there should be a constant effort to raise the standard of qualification.

71,427. (II.) **System of training and probation.**—Apart from the one year's practical experience which I have specified for the Imperial Engineers under paragraph 71,426 (3), I think that it would lead to efficiency and satisfaction if all engineers appointed from England were appointed in the first instance for two years on probation on the understanding that Government would pay for their return passage to England in the event of either party wishing to terminate the engagement at the end of this period, and, that such termination would be free from any implied slur on their professional qualifications. My reason for this suggestion is that it sometimes

happens that a young man on coming to India develops physical or other weakness which to some extent impair his efficiency for service in India: or he finds that he does not like the country. So short a period as two years would not be a serious break in the professional career of a man who might either elect to, or be required to, so terminate his service in India; while it would afford both parties an opportunity of determining whether the engagement might be made permanent with mutual satisfaction.

I would extend the period of probation for Provincial Engineers to two years on works in India and then give each man one year on works at Home with suitable allowances to cover his expenses.

71,428. (III.) **Conditions of service.**—These are generally satisfactory as provided for by the existing Code Rules subject to the remarks I have to make under other heads. I think it is very desirable to make the incremental salary dependent on good work, and not lapse into a mere matter of course. Full opportunity for explanation should be given any officer who is badly reported on by his immediate superior before the increment is withheld.

The rules as to retirement in the case of officers who are shown to be unfitted for further advancement should be strictly enforced, but on the other hand I think, personal allowances should be given to officers whose promotion is stopped by irregularities in past recruitment. I believe this principle has recently been admitted and given effect to in the case of the Indian Civil Service in the Punjab.

71,429. (IV.) **Conditions of salary.**—I consider that the scale of salaries is fair at present both for the Provincial and Imperial branches of the Department.

71,430. (V.) **Conditions of leave.**—I consider either that the limiting maxima of furlough pay should be raised to such amounts as may reasonably be expected to cover an officer's expenses on leave; or that an officer should be given the option of taking half the amount of furlough due to him on full pay with no maxima limits; or that the present restriction of privilege leave accumulation to three months should be extended to six months. My reasons for making these alternative suggestions may best be illustrated by my personal experience. I was obliged to take furlough under very strong medical advice in my eleventh year of service, although I could not afford it. I was married and had a small family. My furlough pay at Home amounted to only £56 a quarter and I returned to India at the end of my furlough £500 in debt. Owing to the financial difficulties in which this first furlough involved me I was unable to take furlough again for another 19 years. During this second period of furlough *i.e.*, in my 30th year of service I was unfortunate enough to incur unexpected expenses owing to the ill-health of my family, which compelled me to curtail the furlough, and once again I returned to India in debt from which I am not yet clear. I have no extravagant habits, and I consider that this actual experience of a European officer serving in India is one which requires very serious consideration as showing that the present facilities for taking necessary long leave are inadequate. It is true that the recent revision of the scales of pay will tend to make it easier, than it was for me, for younger men now in the Service to take long leave; but the limiting maxima from which I suffered still obtain, and I think it entirely in the interest of Government, apart from that of the Service, that the rules should be very carefully revised with a view to making the intention of the Furlough Rules a practical possibility.

71,431. (VI.) **Conditions of Pension.**—These compare unfavourably with the other professional services on a similar footing as to education and social qualifications. The members of the Public Works Department have for many years past been striving to obtain a sympathetic hearing from the Government of India, and the Secretary of State, with a view to being placed on an equal footing in this respect with other sister Services. They have been recently informed by the Government of India, and the Secretary of State, in the House of Parliament, has also stated, that this matter is under reference to the Public Services Commission. I most sincerely hope that the Commission will give it their sympathetic consideration as I am sure that in view of these official announcements any recommendations from them on this subject will carry great weight.

71,432. (VII.) **Such limitations as may exist in the employment of non-Europeans and the working of the existing division of service into the Provincial and Imperial.**—The remarks I have to make on this point apply equally to all Services as they are based on equitable principles which I consider should be strictly adhered to in regulating the recruitment for all services in India. The scale of pay for all the superior Services in India was fixed originally in consideration of the fact that the Services were at the time manned entirely by Europeans. Thus the scale of pay was fixed not for Indians serving in their own country but for Europeans serving in a foreign country. Consequently, if the scale of salaries as fixed for the superior Services in India be compared with the scale of salaries in any other country in which the Public Services are indigenous, they will be found to be comparatvely high. No native of any country will leave his own country to serve in a foreign country on the same rate of pay which would content him and be adequate remuneration if employed in his own country. This is a general principle which has only to be stated to be admitted as essentially logical. The avowed aim of the British Administration in India is gradually to educate and train Indians to take their proper place in the Public Services and the general administration of the country. But I consider that it is not only unnecessary but essentially wrong to admit Indians to the scale of salary which was fixed with reference not to the requirements of an Indian serving in his native country but to those of a European serving in a foreign country. India is not a rich country and cannot afford to pay its indigenous Service at the same rate of pay as it has had to pay its foreign Service. I consider for these reasons that it was an administrative error ever to admit Indians to the rates of pay for service in India which were fixed for Europeans. I believe that if this principle were enunciated authoritatively and observed rigorously it would be accepted as reasonable by all Indians. I believe that the difference of pay in the past has never been objected to except in so far as it has been regarded as an implied slur or mark of inferiority. My opinion as to this has been supported by many conversations which I have had on the subject with Indian gentlemen. For example, when the Public Works Department was divided into the Provincial and Imperial Branches the difference established was not only that of pay but also of the period of service required to qualify for promotion to the higher grades. I believe it was this implied slur or stigma of general inferiority, rather than the difference of pay, which caused the heart-burning and discontent which the matter evoked. This has now been put right so far as the Public Works Service is concerned, and the only difference now obtaining is the difference in pay. This I consider should be the case with all services; namely, one list for all men in the same Service, with Indians on a scale of pay fixed in consideration of the fact that they are serving in their own country, and Europeans on a higher scale of pay fixed in consideration of the fact that they are foreigners serving in a foreign country. It will perhaps be not out of place if I here indicate what apears to me a convenient and simple method of perpetuating this principle and rendering automatic any future revision of salaries such as may occasionally be necessary owing to the rise of prices and general standard of living. It will be remembered that when European salaries were fixed, the value of the rupee was two shillings, but there has been a serious depreciation in the intrinsic value of the salaries owing to the depreciation of silver, and general rise of prices during the last 30 years. The exchange value of the rupee is at present fixed by legislation as to minting at 1*s.* 4*d.* If all salaries both for Indian and European Branches of the same Service were the same in rupees and Europeans were paid in gold at the rate of two shillings to the rupee (which, it should be remembered, was the intention

at the time the scale of their salaries was fixed) the whole matter would be simplified and the European element in the Service would receive their allowance for foreign service in a form which would remove any suggestion of slur on the Indian element in the same Service. As to the numerical proportions to be fixed between the two classes, so far as the Public Works Department is concerned, it may be remarked that the proportion of Indians to Europeans in the Public Works Department was originally *nil*, as no Indians were qualified Engineers, but it has been steadily increasing. I consider it desirable in the interests of the country that for some time to come the European element in the Public Works Department should preponderate, but I do not suggest that the proportion should be definitely fixed for any long period. The British Government are pledged to increase the proportion of the indigenous element as it develops in all Services. Without questioning the wisdom and right of this policy, with which I entirely concur, I am very strongly of opinion that progress in this direction to be safe and healthy must be gradual.

71,433. **(VIII.) Relations of the Service with the Indian Civil Service and other Services.**—This is a somewhat delicate subject which I approach with diffidence. If officers of all branches of the Public Service in India would remember always that they are members of a body corporate and act always with a single eye to the public interest and with due regard to the prestige of the general administration, relations as between the different Services would be ideal. I think it may be said that the majority of officers in India have this point of view and that their conduct throughout their service tends to keep official relations cordial and efficient; but it cannot be denied that there are some officers in all Services whose point of view and conduct in their official relations with other Services do not conduce to this end. While recognising that the complete ideal I have indicated is probably unobtainable, it is nevertheless desirable. An important factor in striving to attain such an ideal consists in mutual encouragement and support on the part of all officers in their dealings with other Services in maintaining that sense of public responsibility and *esprit de corps* in all branches of the Public Services alike, which is essential to a high standard of duty and efficiency in the administration as a whole. I think it would tend to raise the status of officers of the Public Works Department and the general esteem in which they are held by officers in other Services if they were recognised as a Service and not as a department. A member of the Public Works Department may be either a Chief Engineer or a Works Foreman, the letters "P. W. D." do not necessarily indicate a defined and recognised position of public responsibility as do, for example, the letters "I. C. S.," "I. M. S." or "I. F. S." I think that the superior officers of the department should be recognised as belonging to a service which following the precedent set at the time the Royal Indian Engineering College was established might fitly be designated the Royal Indian Engineering Service. Another matter which I think indicates a lapse from the ideal I have referred to and improvement in which would assist towards the attainment of that ideal is the unequal distribution of honours bestowed in recognition of public service as demonstrated by the Honours Lists. This was recently referred to at some length in the Public Press and it is a matter which in my opinion might be put right by a revision of the procedure under which recommendation for such honours is now made.

71,434. **(IX.) Other points.** — I consider it very essential that the Public Works Cadre should be more frequently revised to meet the regularly expanding requirements of works. The shortage of permanent cadre in the past has led to a considerable influx of Temporary Engineers whose services, though temporary in name, have in fact been extended for very long periods. This can only lead to discontent and there is no obvious object to be gained by it, if temporary men are fairly paid, they cost no less than permanent men, and in all interests it is desirable that the permanent staff should be kept up to the numerical standard necessary to deal with permanent works and with the administration of an expanding department. There are a certain number of Temporary Engineers brought out on covenant for 5 years whose services are still retained. Many of them have the qualifications required in the case of Permanent Engineers and ripe Indian experience. I consider that both justice and efficiency would be met if such of these men who have been recommended for permanent employ are brought on to the cadre, fresh recruitment being regulated to admit of this. The present cadre is so ragged as to seniority owing to irregular recruitment in the past that this suggestion would also have the effect of evening it up and I very strongly recommend the case of these men to the notice of the Commission.

Mr. M. NETHERSOLE called and examined.

71,435. (*Chairman.*) The witness said he had occupied the position of Inspector-General of Irrigation since 1912. He was more or less a Consulting Engineer to Government for all Irrigation engineering construction and had very little to do with questions of establishment which were all dealt with by the Secretary.

71,436. The witness considered that the present method of recruitment in England was satisfactory, subject to the qualification that only collegiate institutions should have the privilege of nominating candidates for appointment by a selection committee, and he had in mind colleges where a residential training was possible. He admitted his suggestion might exclude very good colleges, but he was not sure that it would exclude the best. He laid great stress on the value of having men of character and social position in India, as great value was placed on these qualifications by the Indian themselves, a native very often saying that so and so was a *pucca* sahib while so and so was not. He would hardly carry his suggestion so far as to exclude such non-residential colleges as Glasgow, Manchester, and London.

71,437. The witness said he did not know the present process by which names came before the selection committee, but he believed certain Colleges were asked to nominate men who had the necessary professional qualifications and the men appeared before the selection committee. He considered that an Honours Degree as distinct from a Pass Degree should be an essential qualification. There were some Honours men now in the service. His point of view was that the very best men were required, and something higher than the average should be aimed at. He considered that candidates should have at least one year's practical training, and he believed Western practice was of great value for Eastern conditions, especially in the knowledge of Engineering plant, such as excavators, steam navvies, pumping plant, &c., of which there was a good deal in England.

71,438. With regard to selection, the witness considered that it was necessary to have on the selection committee a man who knew Indian conditions and for that purpose retired officers of the Indian Service would be available. He would give the recruits a two years' probation in India, and he did not think that would have any deterrent effect upon recruitment, because a man who had a proper sense of his own importance and some self-respect would not be afraid to come, and may good men would be induced to come knowing that they could go back within a short time without any damage to their ties at home if they found the country did not suit them. He thought the only alternative to the present system was open competition after nomination, as in the Navy; but he considered the present system was quite good if properly carried out.

71,439. The witness did not object to the reservation to Indians of 10 per cent. of the vacancies filled by the Secretary of State, as he thought it was wise to encourage Indians to go to England for the purpose of obtaining technical education. They came out to India with broader minds and were likely to make more useful officers. He would not, however, give them the same pay as the Europeans when they returned.

71,440. The witness said he had had a good deal of experience in examining Engineering candidates in India and in every case he had found it necessary to mark them up. Having given the marks which he considered the papers deserved he found himself "spinning" probably 80 per cent. of the candidates. In England he had never had to make that liberal allowance. The students did not fail in mathematics and technique, but in the practical application of them. He had nothing to complain about with regard to the syllabus of instruction at Rurki College except that on the whole perhaps it was a little too wide; he did not think that for general engineering such a wide range of subjects was required. In the questions set for the examination he would concentrate more on practical knowledge.

71,441. With regard to the division of the service into Imperial and Provincial Branches, the witness pointed out that in the old days, when Rurki was first started, there was no Indian who desired to become an Engineer, the early recruitment to Rurki being entirely from Europeans and especially from among the sons of Army Officers who had inducements held out to them. Of recent years Rurki had ceased to be a European College in any sense of the word and now consisted almost entirely of Indians. It was quite necessary in the old days to give the Europeans from Rurki the same pay and emoluments as were given to other Engineers in the service. Rurki now did not attract the same class of Europeans. He was of opinion that it was possible to break down the distinction between the two branches and still maintain the differences of pay. So far as the superior grades of the Engineering service were concerned there was no necessity for any distinction whatsoever except in the matter of pay.

71,442. The witness did not think it was suitable to train candidates for the Provincial and Subordinate branches in the same classes at college. He thought it would be impracticable to have only one College, possibly Rurki, as a training College for the Superior Service, and he did not think there was any necessity for it. A Southern Indian would much prefer a College in his own Province. If the standard of all the Colleges was raised he did not see why it should be more expensive than concentrating in a single College. The best means of raising the standard was to improve the teaching staff, and that would only be a small item of expenditure.

71,443. The witness was in favour of sending the Indian recruited officers to works in England for a year in much the same way as the Cooper's Hill men used to be sent to works for practical training after they had left the College. A man who had had a training in India and two years' experience of works in India would be able to go to England and assimilate much useful information in connection with plant and mechanical appliances, which information he could afterwards apply in India. From the social point of view he thought it would do no harm, and by the time the man had had a certain amount of practical training in India he would be in a position to make his own way; he would have had a great deal of intercourse with English people before he went and would know how to get along with them.

71,444. The witness did not think it was possible entirely to stop the employment of temporary Engineers. His great objection to the present system was that it had been carried too far in the past. A more frequent revision of the permanent cadre would tend to reduce the number of temporary Engineers. He was acquainted with one or two men with seventeen or eighteen continuous years' service as temporary Engineers and he believed that was a mistake. He would fill such positions by increasing the permanent cadre and as far as possible reserve the temporary Engineer for specific work. There were of course difficulties in the way, as in a large country like India it was impossible exactly to forecast the programme of works. A famine, for instance, would upset the calculations altogether.

71,445. The witness did not agree that there was work in the Service which was rather more important than that performed by the subordinate Service, but of less importance than that performed by the trained Assistant; neither did he agree that a class of Deputy Engineers might be created for such work. He thought the temporary Engineer ought to be paid something in excess of the pay of permanent men or given a bonus at the termination of his service. If a man was only engaged for three years he did not think six months' notice would be necessary.

71,446. It was possible that a certain number of ex-Covenanted Civil Engineers might be absorbed into the permanent list; he knew two such officers who were quite qualified for it. They came in under a belief that they were going to be taken on permanently and one of them was definitely promised an appointment. It would be unfair to put them in at the bottom of the list with regard to pay and seniority, but they would naturally come a little below men of similar age on the permanent list.

71,447. With reference to his scheme for paying the Imperial Officer in sterling at an exchange value of 2*s.* per rupee, the witness explained that the effect of his scheme would be to give the officer from Europe a rate of pay 50 per cent. higher than that of the indigenous officer, and he thought that was about what ought to be paid. It had been more or less already recognised in the code rules as being a fair proportion. There should be no distinction of status as between men employed on the same work, but there should be a definite distinction in the shape of a foreign service allowance to those officers who came from Europe. He thought that would meet with reasonable approval. The only discontent had arisen from the fact that the principle had not been observed. Once the principle was adhered to he thought the whole of India would accept it as reasonable.

71,448. With regard to leave, the witness believed the present grievances might be met by allowing commutation of furlough into full pay subject to some restriction as to the amount to be commuted, and he believed a concession of this kind would be gladly accepted by the Services generally.

71,449. As to pension, the witness considered that retirement after twenty years' service was rather premature. The rule on this point was only introduced to correct an artificial block in promotion, and was intended to be simply a temporary specific.

71,450 (*Lord Ronaldshay.*) The witness said he wished to see the present rule as to candidates having at least one year's practical training on works in England made compulsory.

71,451. With reference to probation, he did not think there would be any slur on a man who was discharged, if the intention were made quite clear in the original agreement.

71,452. The witness thought it would be a good thing on the whole to retain the opportunities now offered to Indians being recruited in England. If a Native of India wished to go to England to get an Engineering education he would give him the chance of doing so and of getting an appointment. He thought, however, it was a mistake to have a prescribed percentage. The present rule was mandatory, and if the number of qualified men was not sufficient, it was necessary to take in inferior men to make up the 10 per cent.

71,453. On the subject of the training of Indians, he was of opinion that each man should be given one year's training on works in England, he did not think that engineering firms would refuse to take Indians as apprentices if they were paid for doing so. When men left Cooper's Hill they were able to get into engineering works he believed with the payment of a premium by the India Office, and he was under the impression that the Engineers in charge of works were glad to get the men because they were a source of pocket money to them.

71,454. Under the present system a large number of temporary Engineers were required to take charge of sub-divisions. If the number of temporary Engineers was reduced and the permanent cadre increased he was not certain that it would be necessary to make the division much smaller than it was at present and to reduce the proportion of sub-divisions to divisions in order to prevent a block in promotion. He would make the number of Assistant Engineers

larger than the number of Executive Engineers, and would correct any tendency to block by raising the qualifying limit for advancement to the grade of Executive Engineer. At present the period was ten or eleven years. He would rather have a permanent servant filling a sub-division than a temporary servant as it was more satisfactory to the Government and to the Service. He would allow the Assistant Engineer to rise to higher pay and ask him to serve longer as an Assistant Engineer than he did now.

71,455. (*Sir Theodore Morison.*) With regard to his proposal to confine recruitment to residential Universities, the witness said he did not want to cut out the modern Universities at all, and if his suggestion tended in that direction he should modify it. He had always understood that both Cambridge and Oxford were asked to nominate two men and Dublin and other Colleges asked to nominate one man, and that from those nominations appointments were made; but it was quite possible he had been misinformed as to the process.

71,456. With reference to the ex-covenanted Engineers, the witness said the Local Governments were asked by the Government of India to nominate men for transfer to the permanent cadre and the Government of India received rather more nominations than they could conveniently deal with and an arbitrary selection was made. The Government cut out some of the senior men because to bring them in it would be necessary to split up a year lower down. There was no ground for saying there was selection on merit. One man was recommended over and over again by the officers under whom he had worked but he was not taken in.

71,457. (*Mr. Chaubal.*) The witness agreed as a matter of principle that if possible the burden on Indian Revenues should be lessened by trying to get efficient work done by an indigenous agency, and he said he would like to see this result brought about. He thought the efforts of Government to turn out efficient Engineers from local Engineering Institutions had to a certain extent succeeded and the outcome of these efforts was to be seen in the proportion of Indians now in the service. Progress had been very rapid indeed. The Indians began with nothing and had now reached very nearly 30 per cent. Under the new rules only a certain number of places were reserved for men trained in Indian Colleges, and he considered it desirable in the interests of the country for some time to come that the European element in the Public Works Department should preponderate. He did not suggest that the proportions should be definitely fixed for any long period, and there ought to be a gradual increasing proportion of Indians in the Service.

71,458. That up to the present Indians had not attained to the grade of Superintending Engineers and chief grades of Superintending Engineer and Chief Engineer was due to the fact that in the Punjab there had not yet been sufficient time. There were Indian Superintending Engineers in Bengal and Madras, and he thought the proportion was good considering the number of Indians who had qualified by service for promotion to these posts. It was impossible to say what percentage of Indians employed in the Department rose to be Superintending Engineers and Chief Engineers. A man had to serve about twenty-three years before reaching administrative rank and there were very few Indians of that standing yet. They would rise ultimately.

71,459. With regard to the pay of Assistant Engineers and Executive Engineers, he thought it was extremely liberal comparing it with what an Engineer working in England received. The witness agreed that an Indian had certain expenses which did not fall upon the European, as for instance in connection with marriage ceremonies and family affairs, and the fact that when he entered the Service he was generally a married man. But even taking those things into consideration he still thought the salary paid to a Provincial Engineer was quite liberal; he did not, however, regard the Engineering Service as one which could be in any sense regarded as leading to wealth.

71,460. As to pensions, the witness agreed that the manner in which a retired European lived in England did not much concern the Indian public, but the Indian public would judge the status of an Indian in the Service by the scale on which he lived after retirement.

77,461. The witness thought the expression "*pucca* sahib" used by Indians generally was synonymous with the word "gentleman," and he was of opinion that residence at an Engineering College was of great value in giving a man that position. He could not say if there was much difference socially between the men who used to go to Cooper's Hill College and the men who now attended such Universities as Glasgow and Manchester.

71,462. The witness said he acted as Examiner at Rurki College from 1901 to 1903 but he was not cognizant of present developments at Rurki.

71,463. (*Mr. Sly.*) With regard to the suggestion that pay should be fixed according to the market value of the candidate whom it was desired to attract to the Service, the witness said it was impossible to recruit the Public Services on a basis of market values. The market value of an Engineer varied enormously. He thought an Indian ought to be obtained for Service in India on a lower rate af pay than a European and by basing the difference of pay on the value of the rupee he thought any suggestion of a slur on the Indian would be avoided. The witness did not attach great importance to the suggestion that had been made to the Commission that the two classes of Chief Engineer should be amalgamated and that there should be one consolidated rate of pay without allowances for all Chief Engineers. He pointed out, however, that there were not two grades of Commissioners in the Indian Civil Service and when an officer reached that standing in the Service one rate of pay should be fixed.

71,464. With reference to pensions, the witness said the comparison he made between the Public Works Department and other Departments had reference chiefly to the Medical Service and the Royal Engineers, the pensions in the Public Works Department not being so good as in those two Services. He knew of no special reason why the rate as to compulsory retirement at fifty-five should be retained, and he did not think the Department would object to the age limit being raised to fifty-eight if it was adhered to. The rule was introduced as a temporary expedient to remedy a block in promotion and had been kept in force ever since.

71,465. The witness was not in favour of a study leave, believing that the present rules were quite sufficient to enable a man to study while on ordinary leave. The leave rules of the Provincial Engineers were loss liberal than those of the Imperial Service, and he would be inclined to extend the period of leave in order that Provincial Engineers might go to England.

71,466. He would not consider study leave as a satisfactory substitute for a year's practical work in England for Provincial Engineers. He would rather give a man an insight into European practice early in his service. After a man had had two years' practical work in India he would be quite capable of assimilating anything likely to be of use to him that he might see in Europe. Afterwards, if he desired to continue his investigations into any special subject, opportunities might be granted to him.

71,467. (*Mr. Fisher.*) The witness was satisfied with the men who were coming out under the present system and saw no reason to consider them inferior to the men who came out under the old system. It was, however, necessary to qualify that by saying that when it was known in England that the prospects of the Department were very bad there was a considerable falling-off in the class of men entering Cooper's Hill in the latter stages of its existence. He thought that if the revision of salaries had been brought in before Cooper's Hill was closed there would have been no falling-off. He thought present rates of pay were attracting quite as good a class of men as would have been obtained at Cooper's Hill. Under the present system a great number of very good Engineering Colleges were drawn upon, but personally he attached considerable value to a collegiate training.

71,468. The witness considered that the employment of a great number of Temporary Engineers constituted an evil and led to discontent. From the point of view of the Public Service it did not make for economy, because a discontented man was apt to be careless and there was a loss of efficiency. There was a distinct difference in the level of efficiency as between the temporary Engineer and the permanent Engineer. A number of temporary Engineers were employed simply because no one else could be obtained, though there were some good men amongst them whom he would like to keep. It was quite obvious that if necessity existed for keeping on a temporary man for seventeen or twenty years it was better that he should have definite prospects.

71,469. The witness explained that estimates for new work were prepared by an Executive Engineer, or in the case of an important work, by a special survey and estimating division, and were usually checked by a Superintending Engineer; they were sent to the Chief Engineer, who looked into them with the aid of his personal Assistant. Men were often hauled over the coals for exceeding estimates, but personally he thought it was a good rather than a bad sign because it showed that the estimates were pretty tight in the beginning, and given careful estimating economy of execution was entirely a matter for the man in charge of the work and the officer supervising him. A good Assistant Engineer would make his maintenance grant go twice as far as a careless one. Although it was not so apparent, he believed efficiency in the Department would show much more as economy in maintenance than in construction. If an officer was economical in the carrying out of works this would be taken into consideration in the matter of promotion, and to that extent there was an incentive to economy, though perhaps not quite so much as there should be. If a man was always spending his repairs grant up to the hilt and his division was in a slipshod order he would be reported upon, and the fact that another man was saving 25 per cent. of his repairs grant and had his division in good order would always be mentioned in the reports.

71,470. (*Mr. Macdonald.*) With regard to his proposals for terminating a man's service at the end of his probationary period, the witness said he did not think that if his proposal were put in force the percentage of rejections would be high. It was very advisable to get rid of unsuitable men early in their career, even if the number so rejected amounted to 5 per cent., and he thought the percentage might well be as high as 5 per cent. having regard to the fact that the retirement would be from two causes, a man not liking India and India not liking a man.

71,471. With regard to the pay of Indian-recruited members of the Service, the witness did not agree that the European staff had set a standard of living which every member of the Service was expected to reach. In the matter of travelling expenses a European would require four bullock carts to carry his belongings about and he had a large number of servants and horses. The Indian would perhaps only have half that number of bullock carts, as his establishment was altogether on a different scale, and he would have a smaller number of servants and horses. Many Indians had taken to living according to European customs but even they could always live cheaper than a European. The witness was not surprised that in the evidence before the Commission so much emphasis was laid upon differences of pay, but he thought if it was once and for all made known to Indian Officers that they were not going to get the same pay as Europeans there would be no discontent on that score. He did not think such discontent would survive a recommendation on the part of the Commission not to put them on equal pay with Europeans.

71,472. The witness said that if the cadre was increased as suggested he would not continue to draw Temporary Engineers from the same sources as they had been drawn from hitherto. At present the Department was often obliged to engage and to keep on a Temporary Engineer who was not quite up to standard, because no other man could be found. A certain number of men were taken each year from Rurki for the Provincial appointments, and from among the unsuccessful students were drawn some of the temporary Engineers, the other going into private employment or posts under district boards. If the cadre was enlarged the best of the temporary Engineers would naturally be absorbed in it, and subsequently the annual recruitment from Rurki and England would be increased. That would mean that certain men would be obtained from Rurki who now went into district and private Engineering. The larger recruitment from India would necessarily mean a lower average for a little time to come. The witness agreed that in the course of a year or two a man who passed out fifth from Rurki might probably be as good as the man who had passed out first. Supposing it was necessary to recruit five or six more Indians every year he was inclined to think that the average efficiency of the Service would be lowered.

71,473. The witness said that opportunity for private practice was now occasionally given. Should a Municipality want Engineering advice in connection with any municipal business and an Engineer obtained permission from the Head of his Department to do the work he was granted a small honorarium, but that only applied to public work. He did not think there was much scope for private work of that character. He considered the present rules met all requirements. He would not encourage outside work because if it became more common men would be looking after private work to the detriment of their official work.

71,474. (*Mr. Madge.*) With regard to the opportunities for seeing Engineering work in England and India respectively, he thought that Mr. Bagley had rather overlooked the mechanical side of Engineering which had developed to a very much greater extent in England than in India, and for that branch of Engineering it was easier to get a training in England. It was, however, a fact that an English Engineer coming out to India was of little use until he had learned the ways of the country, the method of obtaining material, and the power of handling workmen. There was no possibility of giving practical training except by employment on works, and he thought the training at Rurki included visits to Engineering works in India. Generally speaking he though the staff at Rurki was a bit weak for all the subjects that had to be covered, but the appliances at the College were up to date and he had no suggestions to offer for improvement.

71,475. He was glad to hear that hostels were being organised in connection with the Scottish Colleges as it showed that the authorities of the Colleges were of his opinion as to the value of residence. He would not exclude any good Engineering College. His suggestion was that the supervision which was possible in a residential college was of great use and advantage to men in their later career.

71,476. With regard to pay, what he proposed was in effect to give all officers doing the same work the same pay and in addition to pay an exile allowance to Europeans, the allowance being assessed on the basis of a gold standard instead of a silver standard.

71,477. With regard to furlough, the witness considered that furlough depended on considerations of climate. The European was given more furlough than the Indian because, serving in a foreign country, he was supposed to require more change on medical grounds. It was, however, no use giving the European Engineer more leave when he could not afford to take the leave now due to him. The furlough allowance was absolutely inadequate: he himself had never been able to take anything like the furlough he required. The furlough pay should be made adequate to cover the expenses of living in England. He would willingly serve in England on two-thirds of the pay he was drawing in India.

71,478. The witness did not think that the standard of efficiency would be raised by concentrating all the resource and effort in a Central College. A big country like India required to be treated provincially. The establishment of a Central College for the whole of India would not be looked upon with favour by Madras or Burma and he believed Bengal also would object. With reference to the question of preventing blocks in promotion, the witness was of opinion that any increase in the cadre without raising the age limit for the promotion of Assistants would undoubtedly lead to a block, but if the age limit was

raised the cadre could be increased from below without accentuating the chances of a block.

71,479. (*Mr. Arthur Rahim.*) The witness did not agree that it was more or less natural that men should feel a grievance because they were being paid less than some of the men with whom they were working. He thought it was a generally accepted fact that imported labour was always paid more than indigenous labour, and he believed Japan paid the men from England more than they paid their own people in connection with the development of their Navy and other matters. It was hardly likely, for instance, that Mr. Bose, the Chemist, would go from Calcutta to Japan on the same pay as satisfied him in Calcutta. It was true, that illustration related to an expert, but so far as India was concerned the Engineering profession must be regarded as a profession of experts.

71,480. The witness agreed that the standard of living had been rising very rapidly amongst Indians and particularly amongst those who had received an education in England.

71,481. He thought the recruitment of 10 per cent. of Indians in England was illogical but he could not admit that it was illogical that the other 90 per cent. should be British subjects of European descent. What he thought was illogical was that the Secretary of State was bound to recruit 10 per cent. of Indians even though there were not sufficient qualified men to make up the number.

71,482. (*Sir Valentine Chirol.*) Members of the Public Works Department had considerable responsibility in matters of expenditure and supervision of contracts and naturally might be subjected to considerable temptations. Temporary Engineers, not being permanently connected with the Service, might show a tendency to succumb to temptations more than those on the permanent staff, and there had been practical examples of it. With regard to the standard of honesty in the Service, it might be taken as being common in a great measure to both Indians and British members of the Service, but he thought there was a large difference in character which had not yet been eradicated. He did not think India was yet up to the same level of moral character as was shown by the European Service. He would not put the matter only on the ground of honesty, as he thought it was also a matter of temperament or national genius. The European was a practical man; the Indian was more or less metaphysical. A few years ago there was not such a thing as an engineer in India, and he did not think Indians could point to any Engineering Works which had been carried out except under Western guidance. The old Indian Irrigation Works were extremely inefficient.

71,483. (*Sir Murray Hammick.*) With regard to the possibility of having an open competition in Engineering subjects, the witness said the range was wider in an Engineering examination than in the examination for the Indian Civil Service, but he thought it was quite possible to have a fair examination in Engineering. It was true that some men would be better qualified in Electricity and others better qualified in Hydraulics, but he did not think that would be an objection. At Rurki and Cooper's Hill in the old days the final examination depended to a considerable extent on the marks accumulated during the College course.

71,484. With reference to the suggestion that Public Works Officers got into trouble by having a large balance of money at the end of the year, the witness stated that as a rule a sub-division was a fairly large charge and it was impossible to keep payments right up to date. A man knew that if he did not spend his money within the year it would lapse and that he might have to pay for work already done from the next year's grant. That led either to sub-divisional officers making hasty payments or to Executive Engineers asking why money was spent. He did not know why the Government should object to money lapsing into the common fund except that it rather upset the estimated opening balance. A knowledge of that tendency placed the District Engineers to some extent in the hands of contractors, and subordinates would very often keep back bills, and that all tended to a want of economy. The objections to any practical solution of the difficulty had generally come from the financial side.

71,485. (*Mr. Abdur Rahim.*) Desiring to ask questions upon the evidence given by the witness in regard to the moral character of Indians, the Chairman ruled that the further evidence of the witness should be taken *in camera*.

The following evidence was taken in Camera.

71,486. (*Mr. Abdur Rahim.*) With regard to a question whether Indian Engineers in the Service had a lower standard of honesty than English Engineers, the witness said it was rather a difficult question to answer, but it might be said that speaking generally the old principle of *dasturi* in India was a national and general custom. All salaries under Native administrations were very low and inadequate and a large part of a man's remuneration was obtained by what might be called irregular means. The system of taking a percentage from contractors was extremely common right through the subordinate Service, and as many of the Engineers had come from the same class as the subordinates he considered they had a greater tendency to continue the system of taking percentages on their payments than English Engineers. That was not a hypothetical statement as it was made on the strength of more than thirty years' actual knowledge and experience of Native officers, superior as well as subordinate. He had caught two men in the position of Assistant Engineers and they had been punished. He thought in both cases the men had risen from the subordinate ranks and they were both in sub-divisional charges. He had had no cases amongst those who had been appointed direct to the Provincial Service. He was not speaking of men appointed direct from Rurki. Both the cases he had mentioned were of men officiating in the Provincial Service after having risen from the ranks. He had said nothing about the general reputation of Indians in the Public Works Service but referred only to general character .

71,487. (*Mr. Chaubal.*) The witness said that it had never come to his knowledge that a commission had been charged on plant or machinery ordered from England. In fact it was quite impossible so far as the Indian Service was concerned because the ordering was always done by the Director General of Stores in the Secretary of State's office. There was no such thing as an Indian Engineer or a Public Works Engineer ordering direct from England and communicating direct with the manufacturer.

(The witness withdrew).

F. C. ROSE, ESQ., Superintending Engineer, Punjab.

Written Statement relating to the Public Works Department (being a Report proposed by a Committee representing the Imperial Engineers of the Public Works Department, Punjab, which was held at Lahore on 31st March and 1st April,* 1913).

The opinions and recommendations of the Committee are recorded below:—

71,488. (I.) **Method of Recruitment.** — Recruits from the Public Works Department should in future be appointed from England and India. The majority of the Committee considered that the proportion between the two classes should be 70 per cent. from England and 30 per cent. from India, the latter to include recruits from all sources in India. A small minority considered that no proportion should be fixed.

The majority of the Committee agreed that there should be a Central Training College for men to be recruited from England. If this be impossible, the

* The Committee consisted of the following members:—Mr. W. E. T. Bennett, C.S.I., Chief Engineer. Colonel R. S. Maclagan, C.B., C.S.I., Chief Engineer. Messrs. D. W. Aikman, C.I.E.; A. E. Orr, F. C. Rose, W. F. Holms, L. F. Robertson, F. W. Carne, A. S. Montgomery, A. J. Wadley C. J. Floyd, C. B. Williams, F. T. Bates, and H. E. Pellereau, Superintending Engineers, and Mr. R. C. Wilson, Executive Engineer (for Mr. R. C. Laurie, Superintending Engineer. Mr. Bennett and Colonel Maclagan did not vote. The opinions and recommendations recorded in this report are those of the other members of Committee. Mr. Bennett's and Colonel Maclagan's opinion will be found in another report.

present system of selection should be continued, but there should be men with recent Indian experience on the Selection Board.

Men appointed in India should be taken from Indian Engineering Colleges, but candidates should be nominated for Government appointments by a Selection Board prior to entrance into the College.

The permanent cadre should be revised to actual requirements, and the number of temporary Engineers employed should be reduced to a minimum.

Royal Engineers of more than five years' service should not as a rule be appointed to the Department, and on entering should be placed with due regard to seniority.

Specially selected temporary Engineers and Upper Subordinates may be appointed to the Engineering Provincial Establishment in exceptional cases.

The majority of the Committee was of opinion that, of the men appointed in India, 25 per cent. of the appointments should be reserved for statutory natives of India. A minority was of opinion that there should be no fixed percentage. In cases of exceptional merit men may be transferred from the Provincial to the Imperial Service.

71,489. (II.) **System of Training and Probation.**—The Committee was of opinion that after appointment, whether in England or in India, the men should be kept on probation in India for a certain period. As to the length of this probationary period opinions varied from one to five years. Some members were of opinion that if a Central Training College could be established in England, no probationary period would be necessary.

71,490. (III.) **Conditions of Service.**—The Committee was unanimous in considering that the present rules limiting the salary of officers to Rs. 800 in the case of an Imperial and to Rs. 535 in that of a Provincial Engineer, unless in executive charge, should be abolished, and considered that if an officer be reported as fitted for executive charge, he should continue to draw his annual increments. The Committee also considered that executive officers who are recommended as fit for administrative charge, but whose promotion to such rank is blocked by want of vacancies in the cadre, should continue to draw annual increments at the present scale up to a limit of Rs. 1,500 or Rs. 1,000 for the Imperial and Provincial Services, respectively.

The Committee was unanimous in considering that the 55 years' rule should be rigidly enforced, and that in view of the increased cost of living and transport, the travelling allowance rules should be revised and a more liberal scale introduced.

71,491. (IV.) **Conditions of Salary.**—The Committee was of opinion that, owing to the increased cost of living in India, the present salaries do not attract a sufficiently good class of men, and also recorded its opinion that as the money expended in salaries is small in comparison with the total expenditure on works, the recruitment of the very best class of men obtainable would, notwithstanding a small increase in salaries, result in a substantial saving to the State.

It was also of opinion that there should be only two classes of Superintending Engineers on Rs. 1,750 and Rs. 2,000, respectively, and one of Chief Engineer on Rs. 3,000, as those officers are promoted by rigid selection.

The Committee was also of opinion that the proportion at present fixed between the salaries of the Provincial and Imperial Services is correct.

71,492. (V.) **Conditions of Leave.**—The Committee was of opinion:—(*a*) that the restrictions in articles 232 to 236, Civil Service Regulations, on the combination of different kinds of leave should be removed;

(*b*) That the restrictions under article 308, Civil Service Regulations, on the grant (otherwise than on medical certificate) of furlough earned by an officer should also be removed;

(*c*) That a leave ledger system is desirable under which all leave earned by an officer in accordance with the general rules would be entered to his credit, and he would be allowed to draw upon such credit at any time Government could conveniently spare his services;

(*d*) That the restrictions in article 251, Civil Service Regulations, limiting the period of privilege leave to three months should be removed;

(*e*) That the rule laid down in article 299, Civil Service Regulations limiting the amount of furlough and special leave with allowances to six years should be abolished;

(*f*) That periods of furlough which are usually on half-pay should be commutable to shorter leave of absence on a proportionately higher leave allowance;

(*g*) That the first furlough may be taken after six instead of eight years' service;

(*h*) That article 826, Civil Service Regulations, should be abrogated and an officer about to retire should be permitted to take any privilege leave due to him immediately or at any time prior to the date of his retirement;

(*i*) That the leave allowances sanctioned for officers of the Indian Civil Service and Military Officers subject to the Civil Leave Rules should be extended to the Public Works Department Engineer; and

(*j*) That the above recommendations should apply in their entirety to both the Provincial and Imperial Services.

71,493. (VI.) **Conditions of Pension.**—The Committee was unanimously of opinion that the scale of pensions asked for in the memorials repeatedly submitted during late years by the Imperial Service of the Public Works Department is the minimum which should in equity be granted them, and wished to prominently record its opinion that the enormous increase in the cost of living both in this country and at home since the present scale was fixed renders it incumbent on Government to consider without loss of time the very reasonable requests which have been made.

A copy of the most recent memorial is attached* and the attention of the Royal Commission is earnestly invited thereto, as well as to a letter received from the Government of India, a copy of which accompanies, and which clearly shows that the question of pension will be considered on the report of the Royal Commission.

The Committee also desired to invite attention to the fact that the material wealth and prosperity which India now enjoys has been largely built up by the labours of the Public Works Department Engineer who has so far received no adequate recompense, and who is still compelled to retire on a pension which has, through the increased cost of living, now become a mere subsistence allowance.

71,494. (VII.) **Such limitations as may exist in the employment of Non-Europeans and working of the existing system of division of services into Imperial and Provincial.**—Under this head the Committee merely wish to add to what has already been recorded in paragraph 71,488 (*Method of Recruitment*). It suggested that of the men appointed in England 10 per cent. should be Indians and of the men appointed in India 75 per cent. should be of the same nationality. This is exhibited in the table below:—

Total appointments 100—

(A.) Appointed in England	... ...	70
(B.) Appointed in India	... ...	30

Out of (A) 7 appointments to be reserved for Indians and the balance for non-Indians. Out of (B) 23 appointments to be reserved for Indians and the balance, *viz.*, 7 for statutory Natives of India.

71,495. (VIII.) **Relations of the service with Indian Civil Service and other Services.**—The Committee was unanimously of opinion that no officer of the Public Works Department should, under any circumstances whatever, be called upon to serve under the orders of any Divisional or District Civil Officer who is not a professional engineer and that no one, not an Engineer by profession, should ever be appointed to the posts of Chief Engineer or Secretary, Public Works Department.

71,496. (IX.) **Any other points within the terms of reference to the Royal Commission not covered by the preceding heads.**—The Committee was of opinion—

(*a*) That the Public Works Department should be designated a "Service."

* Appendix XIII. (Memorial of 1912).

(*b*) That study leave should be more freely granted as in the case of the Indian Medical Service.

(*c*) Permission to accept fees for outside professional work should be given more freely.

(*d*) That the Government should seriously consider the instituting of a Widow and Orphans Fund, and

(*e*) That the question of invalid pensions should be reconsidered with a view to improvement.

Minority Note by Messrs. D. W. Aikman, W. F. Holms, F. Bates, R. E. Purves, and C. J. Floyd.

71,497. (1) While agreeing generally with the corporate opinion of the majority of the Superintering Engineers (see paragraphs 71,488–17,496) which sat in Lahore in conference on 31st March 1913 and following dates, a small minority consisting of the undersigned felt so strongly that a mistake would be made if the present division of the Public Works Department into Imperial and Provincial was maintained, that they desire to record briefly a Note of Dissent with their reasons.

(2) To this minority it seemed that, while recognizing that possibly Government might be able to secure the services of recruits of the same class as now fill the ranks of the Provincial Service at a smaller rate of salary than recruits of the stamp which come from England, the benefits of having the officers of an important professional service treated alike in every respect as to pay, pension and leave were so great that the small direct extra cost to the tax-payer would be more than recouped indirectly by the increased efficiency of the Department.

(3) Among other causes of the present want of efficiency are great and natural discontent among the Provincial Engineers, which sometimes manifests itself in ill-feeling towards their better-paid Imperial brethren, and a complete absence of departmental *esprit de corps* and cordiality among all ranks. It is thought that these and other factors, all tending to inefficiency, will have less force if the department is not divided into two main classes of permanent men as now, and all invidious distinctions be removed with a view to making all its officers equally satisfied with the conditions they serve under and proud of the service to which they belong.

(4) Lest objections be raised to the small direct extra cost of the suggested amalgamation, it may not be out of place to emphasize the fact, well known to every experienced engineer in the world, that a capable man can save his employers his salary and often many times his salary throughout his service. This is equally true of men who are largely engaged on revenue work in addition to their professional duties as are many of the Punjab Irrigation Engineers.

(5) Bearing in mind then the great importance, both financialy and politically, of aiming at an extremely high standard of efficiency, it is suggested that a sufficiently long period of probation to test thoroughly the qualities of the recruit, from whatever source he comes, be imposed before he is finally accepted as a permanent engineer. But if during his probation it be clear that the candidate is unsuitable, his services should be immediately and without hesitation dispensed with, alike in his own and Government interest.

(6) Final selection or rejection should be preferably made by a board rather than by an individual.

(7) The Provincial Service, if retained, should be filled only by promoted Upper Subordinates, who being admittedly, socially and educationally inferior could have no possible grievance at being put to a lower scale of pay.

**Written Statement of the Views of the Provincial Service Engineers.*

71,498. The Provincial Engineers agree generally with the Written Statement put in by the Imperial Engineers† except in so far as their opinion affects the principle that there should be one service only. The Provincial Engineers are unanimous that there should be only one service with no distinction of pay, leave rules, pension or allowances between the men appointed in England and India. The Provincial Service Scheme has been a failure, as it has created much discontent and has destroyed the *esprit de corps* that should exist in the service and without which true efficiency cannot be assured. The scheme was introduced as an experimental measure for seven years (*vide* resolution No. 2523 G., dated 28th September 1893, paragraph 10, page 5), and should have been abandoned long ago. The principle in the Public Works Department should be that men doing the same work should get the same pay according to length of approved service. The present possible condition that a Provincial, Executive or Administrative Officer may get a smaller salary than men working under him is an impossible one and can only lead to discontent and misconception.

71,499. (I.) **Method of Recruitment.**—Recruitment should be 50 per cent. in England and 50 per cent. in India, and there should be no distinction in either country in nationality, creed or colour. There should be open competition in England, three candidates being nominated to compete for each appointment. In India there should be selection prior to admission to the Indian Engineering Colleges for Government appointments. The same proportion of three candidates for each appointment should be maintained.

71,500. (II.) **System of Training and Probation.**—They agree entirely with the opinon expressed in the Imperial Engineers' statement.

71,501. (III.) **Conditions of Service.**—The Provincial Engineers agree to the principle that increments should be continued, but there should be no distinction in pay.

71,502. (IV.) **Conditions of Salary.**—Agree, except that there should be only one service and one scale of salaries for all.

71,503. (V.)–(VI) **Conditions of Leave and Pension.**—Agree.

71,504. (VII.) **Such Limitations as may Exist in the Employment of Non-Europeans, and the Working of the Existing Division of Services into Imperial and Provincial.**—There should be only one service and no fixed proportion of appointments of different nationalities.

71,505. (VIII.) **Relations of the Service with the Indian Civil Service and Other Services, and (IX.) Other Points.**—Agree.

Note by the Chief Engineers, Buildings and Roads and Irrigation Branches, Public Works Department, Punjab, on the Corporate Report of the Departmental Committee held in Lahore on the 31st March and 1st April* 1913†.

71,506. (I.) **Methods of Recruitment.**—The present sources of recruitment to the Indian Public Works Department are the following:—

(*i*) selection by the Secretary of State from the open market in England;

(*ii*) from Engineering Colleges in India;

(*iii*) from the Royal Engineer Corps;

(*iv*) from the Upper Subordinate Establishment of the Public Works Department in India;

(*v*) from the open market in India;

and the Chief Engineers accept all the recommendations made under this head by the Committee, subject to their further remarks under head VII.

71,507. (II.) **System of Training and Probation.**—The Chief Engineers agree with the Committee that a period of probation for all recruits to the Department would be desirable and advantageous to the best interests of the service.

71,508. (III.)–(VI.) **Conditions of Service, Salary, Leave, and Pension, (VIII.) Relations of the Service with the Indian Civil Service and other Services,**

* This statement was signed by Messrs. Baij Nath, M. S. Dhody, and J. W. B. Loughran.

† This is included as paragraphs 71,488-96 *ante*.

* This note was signed by Messrs. W. E. T. Bennett and F. E. Guzther, and Col. R. S. Maclagan.

† The Report is included as paragraphs 71,488-96 *ante*.

(IX.) **Other Points.**—The Chief Engineers see no reason to differ from the conclusions arrived at by the Committee under each of the above heads, and, if it is decided to maintain the Provincial Service, accept them.

71,509. (VII.) **Such Limitations as may Exist in the Employment of Non-Europeans, and the Working of the Existing System of Division of Services into Imperial and Provincial.**—The Chief Engineers agree with the opinion of the majority that recruitment, as between Europeans and Indians should be fixed by a definite scale, and concur in the proposal that 70 per cent. of the total strength of the Department be recruited from England, and 30 per cent. from India.

They also accept the recommendation that of the recruits selected annually in England, not more than 10 per cent. should be Indians.

As regards recruitment in India, the Chief Engineers are unanimously of opinion that 60 per cent. of the annual recruits from this source should be reserved for Indians, and 40 per cent. for statutory natives of India.

Recruitment to the Department would thus amount to—

—	From England.	From India.	Total.
Of Europeans ...	63	12	75
Of Indians	7	18	25

And this is the proportion which, in the opinion of the Chief Engineers, is essential to the efficiency of the Department and which should be aimed at in recruiting Indians for the service.

With regard to the second reference under this head, the Chief Engineers favour the Minority Report, attached to that of the Committee, and entirely agree with it: they are of opinion that if the existing division of the Public Works Department into Imperial and Provincial Services is maintained, the efficiency of the Department as a whole will be impaired.

Written statement relating to the Public Works Department, being a Memorandum by Mr. F. C. Rose.

71,510. (I.) **Methods of Recruitment.**—There is a strong wish among most of the members of the Imperial Service that a residential College, on the lines of the late Royal Indian Engineering College, Coopers Hill, should be established in England, from which Imperial Engineers for the Public Works and Railway Departments would be recruited. They consider that the training which such a College would afford would foster an *esprit-de-corps* which is not to be anticipated among men recruited in the open market, and that this spirit and the qualities which it engenders are of the utmost value to the individual, to the Department and to Government. Students would then be kept under close observation for a considerable period, and there would be less likelihood of men unsuited to the needs of India being appointed than if recruitment is made in the open market.

Assuming then that recruitment by selection, in accordance with the present method, must necessarily be maintained, they urge that at least 50 per cent. of the members forming the Selection Committee should be senior officers of the Public Works and Railway Departments, either on the active or retired lists, as it is felt that the intimate knowledge of these Departments and their requirements possessed by such officers would be of much value in assisting the Committee in their selection of the right class of man.

71,511. (II.) **Training and Probation.**—*Training.*—It is suggested that it should be made a condition of appointment, that recruits should have had at least one year's practical experience on Engineering Works in the British Isles, in addition to an adequate theoretical training.

Probation.—Opinions differ as to the necessity of a probationary period of service in India. While some members of the Imperial Service consider that an officer should be permanently appointed to the Department from the commencement of his service, others consider that it would tend to make the service more efficient if a probationary period of three years for both Imperial and Provincial services were insisted on. At the end of the period of probation if an officer were considered unsuitable, it is suggested that his services be dispensed with and if recruited in England his return passage paid. Officers considered suitable would be permanently appointed and would count their service for pay, pension, &c., from the commencement of the probationary period. The usual annual increment would be paid to officers on probation until their suitability or otherwise was determined. The period of probation appears to be the more necessary if the conditions of present recruitment are continued. The Selection Committee have only a short interview in which to judge the candidates' personal character and traits, and it is possible that recruits may be admitted whose temperament is totally unfitted for their work in this country, and it is unfair to Government and the Service that such men should be permanently kept on.

71,512. (III.) **Conditions of Service.**—It is urged that the cadre of the permanent Engineers should be more frequently revised than has been the case in the past. It is advisable that the number of Permanent Engineers should more closely accord with the number of permanent appointments, and that less reliance be placed upon making up deficiencies by the employment of Temporary Engineers. In support of this suggestion attention is invited to the following extract from the Report of the Irrigation Commission of 1901, which, although recorded in connection with the Irrigation Branch, applies equally to all Branches. "*Paragraph* 306.—We trust, therefore, that the great importance of providing an adequate staff of Engineers for the maintenance and management of the larger irrigation works may be steadily borne in mind whenever the revision of the establishment scale is under consideration, and that it may not be supposed that temporary establishments only are required, which can be discharged or reduced when works are brought to completion. Canal management is as important a part of the duties of the Public Works Department as canal construction, and we may add that success in the design and construction of new works depends to a great extent on the management of those which have been completed."

The conditions under which Royal Engineers are drafted into the Public Works Department have affected adversely the position and prospects of a large number of Civil Engineers. Royal Engineers brought in are usually credited with extra departmental service to such an extent as to give them departmental seniority over Civil Engineers who are senior to them in age, and of many years' standing in the Department. The effect on a Civil Engineer thus superseded is utterly disheartening; if senior, his promotion to administrative rank is retarded, or he may even be prevented from ever reaching administrative rank, and, if junior, it may result in delaying him from being placed in a Divisional charge. Whatever form it may take, the result is to subject him at one time or another to a heavy pecuniary penalty. It is recognised that it is necessary in the interest of Government that employment should be found for Royal Engineers in the Department, but it is strongly urged that in justice the appointments should be made in such a manner as not to impair the prospects of Civil Engineers of the same age already serving in the Departments. It is suggested that Royal Engineers should, like Civil Engineers, join the Department before attaining 25 years of age and that the present system, whereby senior Royal Engineers are appointed to the Department, thus superseding Civil Engineers, who by length of service have acquired a certain right to their position on the list, should be abandoned.

Similarly it is urged that if Government transfer any Temporary Engineers now serving in the Department to the permanent scale it should be done in such a way as to safeguard the prospects of officers already on that scale. Future appointments of Temporary Engineers should only be made on the specific understanding that the holders of the same will not under any circumstances be brought on to the permanent scale.

Article 649 of the Civil Service Regulations which provides for the compulsory retirement of Civil

Engineers, who on attaining the age of fifty years have not been promoted to the rank of Superintending Engineer, should, it is considered, be more rigidly enforced in the case of officers, who on reaching that age are reported as not qualified for promotion to the rank of Superintending Engineer.

In paragraph 80, Volume 1, of the Public Works Department Code, the principle is laid down, that promotion to the administrative ranks should be by a system of selection as opposed to that of seniority. This principle should be more closely followed than at present.

It is urged that no extension of service should be given to any officer beyond the limit laid down in the Civil Service Regulations, and that it ought to be a recognized principle that Government should observe its own regulations as strictly as its own officers are expected to observe them. Recent extensions of service to certain officers beyond the age of fifty-five did seriously affect the pay, position and general prospects of a number of officers of the Department, besides creating a feeling of distrust between junior and senior officers.

71,513. (IV.) **Conditions of Salary.**—In 1908 the scale of pay of the Public Works Department was reorganized and placed on an incremental basis, but at the same time the exchange compensation formerly given to officers was withdrawn. The nett increase in actual emoluments was not commensurate with the increased cost of living in India, which has been so marked a feature of the last decade, and it is felt that the question of pay requires further consideration, and that the pay of the Department should be such as to secure the recruitment of the very best class of men available. The increase in salaries would thereby result in a substantial saving to the State by more efficient service. There is probably no other service in India where inefficiency is so expensive as in the Public Works Department, and it is strongly urged that by the recruitment of the very best material economy in the design and execution of work is secured. It will be readily admitted that an engineer with powers of organization, initiation and invention will save his employers yearly sums which would many times cover his salary.

The following cases of individual hardship which may arise owing to irregularity of recruitment are brought to notice, and suggestions put forward for their mitigation:—

i. Under the reorganization scheme of 1908 it is ruled that an officer may not draw more pay than Rs. 800 per month unless he is in charge of a division, or in a charge which in the opinion of the Local Government is of equal importance. This is unjust to an officer who, though fully qualified, does not obtain a divisional charge simply because there is no vacancy for him. It is strongly urged that the rule should be amended to the effect that an officer of the Imperial Service reported as fit to hold a divisional charge, should continue to receive the ordinary increments laid down in the scale, irrespective of his being in actual divisional charge.

ii. Under the reorganization scheme, Executive Engineers attain their maximum pay of Rs. 1,250 per mensem after 19 years' service. It is urged that an Executive Engineer, if considered qualified for promotion to Superintending Engineer's rank, should continue to draw further annual increments until such time as he is promoted to administrative rank up to a limit of Rs. 1,400.

It is also considered that there should be only two classes of Superintending Engineers on Rs. 1,750 and on Rs. 2,000, respectively, as these officers are promoted by rigid selection.

The present division of the rank of Chief Engineer into two classes, and the variation of local allowances as Secretary to a Local Government, gives rise to the anomaly that a Chief Engineer may be drawing less emoluments than a Chief Engineer junior to him in service in another province, although the work and responsibilities attached to all such posts are exactly similar. The pay of a first class Chief Engineer is generally equal to that of a Commissioner of a division, and whereas the area, over which the latter exercises control, constitutes only a small portion of a Province, the responsibility of the former extends over a whole Province. The number of Chief Engineerships throughout the whole of India is small, and with the exception of the post of Secretary to the Government of India in the Public Works Department and that of Inspector-General of Irrigation they are the only highly paid posts to which an officer of the Public Works Department can hope to attain. On the other hand, there are a number of Commissionerships in each Province in addition to many other high offices, both with Local Governments and with the Government of India, which fall to the lot of officers of the Indian Civil Service. Having regard to these facts it is not considered too much to urge, that there should be only one class of Chief Engineer, and that the salary attached to the appointment should be Rs. 3,000 per mensem irrespective of whether a Secretaryship to a Local Government goes with the appointment or not. In this event the local allowance of Rs. 250 or Rs. 150 a month, according to whether a Chief Engineer is a Secretary to a Local Government or Local Administration, might be withdrawn.

For similar reasons as in the foregoing, it is considered that the duties and responsibilities ataching to the post of Secretary to the Government of India in the Public Works Department, which appointment is invariably held by an officer specially selected from among Chief Engineers and usually of much longer service than any other Secretary to the Government of India, warrant the appointment being paid at the same rate as Secretaries in the Home, Finance, and Commerce and Industry Departments, *viz.*, Rs. 4,000 per mensem.

71,514. (V). **Conditions of Leave.**—*Furlough.*—The amount of furlough, which Imperial Officers of the Public Works Department appointed in England can earn is generally considered sufficient. The rules governing the grant of furlough are practically identical with those which apply to the Indian Civil Service and Military Officers subject to Civil leave rules, except in the most important particular of leave allowances. In the case of officers of the Indian Civil Service and Military Officers under Civil leave rules, furlough allowances are subject, if paid at the Home Treasury, to a minimum limit of £500 per annum, or the salary last drawn, whichever is less, and to a maximum limit of £1,000 per annum, whereas for Civil Engineer Officers of the Public Works Department there is no minimum limit and the maximum has been fixed at £800 per annum. The present furlough allowances permissible to Imperial Civil Engineers are as follows:—

Years of Completed Service.	Maximum Furlough Pay.	Years of Completed Service.	Maximum Furlough Pay.
	£		£
8	279	17	472½
9	297	18	495
10	316½	19	517½
11	327½	20	540
12	360	21	555
13	382½	22	562½
14	405	3 years as Superintending Engineer, 3rd grade.	675
15	427½	3 years as Superintending Engineer, 2nd grade.	787½
16	450	Thereafter	800

As long ago as 1870, in Despatch No. 43 P.W., dated 28th March, the Government of India said—"Section 16. With reference to paragraph 4 of your Grace's despatch under reply, we may remark that we have already recommended the equalization of the pay of the Military Branches of the Department, and we are gratified to find this proof that Her Majesty's Government are likely to receive that proposal favourably. On this point we only add that we shall be glad to see some plan adopted by which the furlough allowances of Civil Engineers shall be equalized with those of Military Officers in the Public Works Department and, so far as practicable, the advantages of pension also." This hope has been reiterated many times by the Government of India and by different Secretaries of State since the date of that despatch.

It is, however, a hope that remains unrealized up to the present day, since a Royal Engineer in the Public Works Department, with 8 years' service to his credit, is entitled to almost double the furlough allowances of a Civil Engineer Officer doing exactly the same class of work and having the same service in the Department. A Civil Engineer is obliged to complete 18 years' service before he can claim an allowance approaching that which a Royal Engineer is entitled to after 8 years' service.

The present allowances are so inadequate that a large majority of officers cannot avail themselves of the furlough due to them, even though the state of their health urgently demands that they should do so. That such is the case is assuredly not in the best interests of the general administration. The question of leave allowances is raised in the last paragraph of the Memorials recently submitted by officers of these Departments; copies of which are attached to this Memorandum as Appendices 1 and 2.* The reply given to the Memorialists by the Government of India was that—" .....Pensions and leave are subjects of reference to the Public Services Commission, and as no doubt the Commission will inquire into these matters and submit recommendations, the Government of India consider that no useful purpose will be served by considering the prayers of the memorialists at this stage."†

In these circumstances it is confidently hoped that the Royal Commission will be able to recommend that the leave allowances sanctioned for officers of the Indian Civil Service and Military Officers subject to civil leave rules, may be made applicable to Imperial Civil Engineer Officers of the Public Works. There is no valid reason why they should receive less favourable treatment than the other officers named. It is pointed out that feeling on this question is very strong, and that there is great discontent regarding the inadequacy of leave allowances.

It is urged that where the allowances are drawn in India they should be paid in the equivalent in rupees, at fifteen rupees to the pound sterling.

Grant of Furlough.—Furlough earned by an officer should be granted at any time after the completion of eight years' service, subject to the exigencies of the service, unless the applicant has returned within eighteen months from privilege leave covering a period of three months.

Special Leave.—The existing rules regarding the grant of special leave require no alterations, but the allowances should be the same as in the case of furlough.

Privilege Leave.—Under the present rules an officer can earn privilege leave to the extent of one calendar month for every eleven complete calendar months of duty, and such leave is cumulative up to a period of three months only. In the case of officers who have accumulated the full period it frequently happens that the exigencies of the public service prevent their being granted privilege leave when they desire it, and this leads to the leave lapsing through no fault of their own. It would in a measure mitigate against this loss of leave on full pay which an officer has fairly earned, if the cumulative period were extended from three to six months.

An officer should be allowed to avail himself of all privilege leave due to him immediately prior to retirement, and be permitted to retire from the service at the end of his leave, without having to return to duty as he is now obliged to do. This concession has already been made where privilege leave is combined with other leave, and its extension to privilege leave, alone, besides removing a legitimate grievance among officers of the Department, would lead to much less administrative inconvenience than is now the case.

Study Leave.—Modern Civil Engineering is a highly specialized profession and progress in the methods of construction is very rapid. In view of the vast undertakings of the Government of India in the Public Works Department, it is essential for efficiency and economy, that the Engineering Staff of the Department should keep themselves abreast of modern engineering practice. Engineers can only accomplish this by visiting and studying works of special interest in progress in different parts of the world. That the importance of this is recognised by other nationalities is instanced by the number of engineers who are commissioned by their respective Governments or private employers, to visit works in India, in order to study Indian methods. The majority of Civil Engineers serving in the Department who wish to visit works in the British Isles and other countries, have to do so as private individuals, and entirely at their own expense unless they are placed on deputation, or are specially permitted to visit certain works while on leave, permission in this case usually being given only when Government require special information regarding a particular aspect of a project. In the latter case certain travelling and other expenses are allowed, but the time spent in the visits counts against the officer's period of leave. It is suggested that officers of the Public Works Department should be encouraged to visit works outside India, and that they should be provided with every facility for doing so. Either new rules should be introduced to admit of these facilities being granted, or there should be a much more liberal interpretation of the existing rules regarding the placing of an officer on deputation. The following instance of study leave obtaining in another professional service is cited:—In the Indian Medical Service study leave is granted in England up to one year out of total service in addition to furlough, for the purpose of allowing an officer to study any particular aspect of his profession which he may desire. During this period he receives furlough pay and lodging allowance amounting from four to eight shillings per day.

71,515. **(VI.) Conditions of Pensions.**—The greatest grievance of Civil Engineer officers of the Public Works Departments and one which is most sorely felt is the totally inadequate retiring pension to which they become entitled under the existing rules. Many efforts have been made, spread over a period of forty years or more, to obtain amelioration in this respect. Both the Government of India and different Secretaries of State have long recognized that all was not well, and new rules and conditions have been introduced to improve matters, but the net result has been that the present pensions are actually less than they were 40 years ago, when the qualifications demanded from men joining the service were not as high as they are now and when the cost of living was considerably less. A short history of the Public Works Department pension rules is attached to this note*. Numerous memorials on this subject have been submitted to the Government of India and H.M. Secretary of State during the last 6 years by officers of the Department. Copies of the most recent are attached.† The first memorials were submitted in 1907, but the petitioners were favoured with no reply up to August 1912 when they were informed by the Government of India in their letter No. 942-E., dated 30th August 1912, that no decision could be arrived at pending the receipt of the report of the Royal Commission on the Public Services in India. It is to the Royal Commission therefore that the Civil Engineer Officers now look for redress of this long standing grievance and it is strongly and respectfully urged that the scale of pensions prayed for in the memorials of 1912-13†, is the least which can in equity be recommended.

Further, that as this grievance was brought prominently to the notice of the Government of India, in the memorials of 1907-08 to which they vouchsafed no reply, and as in the meantime a number of officers affected have been placed on the retired list and many more will probably be called upon to retire before a decision is arrived at, any improvements made in the scale of pensions should have retrospective effect, at least from the year 1908.

Prior to 1884, invalid pensions granted to Civil Engineer Officers of the Public Works Department on the Imperial List were governed by Article 474 of the Civil Service Regulations; this Article also governed the pensions of all officers belonging to the Un-

* These appear in Appendix XIII.

† Government of India's letter P. W. D. 1399—1408 E., dated July 23rd, 1913—not reprinted.

* A copy is given as Annexure V to the evidence of Mr. W. S. Dorman (*vide* page 146).

† These are printed in Appendix XIII.

covenanted Services as then termed. In Lord Kimberley's Despatch of 1838* a new scale was introduced for Imperial Engineers and Telegraph Officers, with a view to ameliorating their conditions of service; this scale is covered by Article 641 of the Civil Service Regulations. Under this Article the scale has been increased from $\frac{10}{60}$ths of average salary for 10 years' completed service, $\frac{11}{60}$ths for 11 years, and so on, to $\frac{20}{60}$ths for ten years, $\frac{21}{60}$ths for 11 years and so on, but at the same time the maxima limits have been reduced from those allowed by Article 474. How this rule brought in with the object of improving conditions in certain Services adversely affects officers at the present time, and how much better off an invalided engineer would have been under Civil Service Regulations, Article 474, is clearly shown from a comparison of the columns in the table below:—

Years of completed service.	Civil Service Regulations, Article 641.		Civil Service Regulations, Article 474.	
	Amount calculated on a percentage basis.	Fixed maximum.	Amount calculated on a percentage basis.	Fixed maximum.
	Rs.	Rs.	Rs.	Rs.
10	20/60 2,813	1,000	10/60 1,406	2,000
11	21/60 3,150	1,400	11/60 1,650	2,200
12	22/60 3,520	1,800	12/60 1,920	2,400
13	23/60 3,910	2,200	13/60 2,210	2,600
14	24/60 4,320	2,600	14/60 2,520	2,800
15	25/60 4,750	3,000	15/60 2,850	3,000
16	26/60 5,200	3,000	16/60 3,200	3,200
17	27/60 5,670	3,000	17/60 3,570	3,400
18	28/60 6,160	3,000	18/60 3,960	3,600
19	29/60 6,670	3,000	19/60 4,370	3,800
20	30/60 7,200	4,000	20/60 4,800	4,000

It is a decided anomaly that officers of other services coming under Civil Service Regulations, Article 474, and drawing the same pay as an Engineer, should, if invalided, be entitled to a higher pension after 10, 11, 12, 13, 16, 17, 18 and 19 years' completed service and to a less pension after 14 or 15 years' service. It is urged, therefore, that to remove the anomalies pointed out, and to make Article 641 of real benefit to Civil Engineer Officers now serving in the Department, that the maxima limits should be at least the same as those fixed according to Article 474.

There is a strong wish among the Imperial Engineers that there should be one set of leave and pension rules for all Civil Engineer Officers on the Imperial List, irrespective of the source from which they were recruited. Such differentiations as still exist should, it is considered, be abolished.

Family Pension Fund.—Unlike the Indian Civil Service and the Military Services in India, there is no official Family Pension Fund for the Public Works Department. The emoluments of officers in this Department are not sufficient to admit of their making adequate provision for their families should they die in harness. The knowledge that they are unable to make such provision is a constant source of anxiety to many officers who are entirely dependent on their salary, and whose duties constantly take them into situations, which are prejudicial to health. They also have the additional anxiety of knowing that their pensions are purely personal and cease with their death. There is a strong desire, therefore, that means may be found whereby an officer may be aided in making suitable provision against the event of his death for the members of his family dependent upon him. Pension has been officially defined as deferred remuneration, which means that a certain portion of the salary which would have been paid to an officer, had there been no pension attached to his appointment, is kept back to provide for a pension on retirement. This view is corroborated by the fact that when an officer is transferred on Foreign Service he is made to contribute towards the cost of his pension at the rate of one-sixth of the pay he would have received had he remained in the service of the Government of India. It may be presumed, therefore, that an officer only receives six-sevenths of the pay he would have received had there been no pension to provide for, and that one-seventh is kept back by Government as the officer's contribution towards his pension fund. If the officer had the option of investing with a private Insurance Company the amount assumed to be retained by Government to provide for an annuity, he could probably so arrange the terms that a portion of his annuity would be assured to his widow or other member of his family dependent upon him, should his death take place within a certain number of years from the date his annuity fell due, with the additional security that his family would be covered against the risk of his death, should it take place during the time he was subscribing to his annuity, in the guarantee of a considerable sum of money. Could some such scheme be worked out by Government on an actuarial basis a large number of officers, not only in the Public Works Department but in other Services similarly unprotected, would be glad to avail themselves of it and to subscribe towards the extra cost.

71,516. **(VII.) Such Limitations as may Exist in the Employment of Non-Europeans and Working of the Existing System of Division of Services into Imperial and Provincial.**—The question raised under this head is one which the Engineers in the Imperial Service have fully and sympathetically considered. As regards the division of Services into Imperial and Provincial it seems necessary in the interests of Government itself that this should remain. It is an economic fact that imported labour has invariably to be paid more highly than home labour, and Government has the right to expect that native-born officers should serve in India on less pay than has to be given to the imported officers. The Englishman serving in India is not working under the same conditions as the Indian. He cannot live so cheaply and has necessarily to bear periodically the expense of long and expensive journeys home for himself and his family, the necessity of which is more often than not due to living under trying climatic conditions. Education for his family in England cost considerably more than education in India and almost without exception during the course of his service each officer has to bear the expenses of two establishments, one in England and one in India. It is considered, however, that officers in both Services should be borne on the same lists for purposes of seniority and promotion. The case is complicated by the presence of a small body of the domiciled community in the ranks of the Provincial Service. These men undoubtedly labour under some hardships, but no reasonable remedy has been suggested.

As regards the proportion of Imperial and Provincial Engineers it is considered that in the interests of efficiency the proportion of imported Engineers should for the present be not less than 70 per cent. In process of time this proportion could be reduced, as increased general efficiency in the Provincial Service is apparent. It is felt that the present system of recruitment is capable of improvement and that before candidates are allowed to enter Rurki or other training colleges a system of selection should be adopted. It is an undoubted fact that at the present many men recruited from Indian Colleges lack energy, power of organization, initiative, resource, ability to control, fairness in dealing with subordinates and other qualities essential for the efficient discharge of work in the Public Works Department and it is felt that the main object to aim at is to build up a Provincial

* Not reprinted.

Service which, in general conduct and qualifications, can compare favourably with the Imperial Service. Care in recruiting and in addition the rejection of men found unsuitable after a term of probation will undoubtedly help to this end, which, when gained, would in itself be the best argument for increasing the proportion of Indian Engineers.

It is suggested that Provincial Service officers selected for both the rank of Superintending Engineer and Chief Engineer should receive the same salary as officers of the Imperial Service.

Finally it is strongly urged that in considering any changes in organisation the efficiency of the Department should be kept in view. The prospects offered to men entering the Department should be such as to attract the very best material procurable. Careful selection combined with rejection of men subsequently found unsuitable will best secure the interests of the Government. In a large spending Department, like the Public Works Department, certain qualities of character are essential and if the qualifications and integrity of superior officers are not of the highest, it can only result in inefficiency, causing thereby serious loss of revenue to Government and waste of public money.

71,517. **(VIII.) Relations with the Indian Civil and other Services.**—It is considered that the relationship as existing between the Public Works Department and other Services in India is at present on the whole satisfactory and should remain unaltered.

71,518. **(IX.) Any other Points within the Terms of Reference to the Royal Commission not covered by the preceding heads.**—*Travelling allowances.*—It is thought that the question of travelling allowances requires consideration. The rates of travelling allowance on tour are the same as they were 25 or 30 years ago although the hire of means of conveyance has certainly increased more than 50 per cent., while the price of horses necessary to most officers for their work has increased by at least 100 per cent. The consequence is that officers, who have much district work, are actually out of pocket, in travelling expenses.

Travelling Allowance on transfer.—The inadequacy of travelling allowance in the case of transfers is glaring. The question is common to other Departments. While admitting that transfers in the interests of the Public Service must inevitably involve some expense to the officers transferred, and the practical impossibility of framing any rules suitable to all cases that will obviate it, it is considered that the actual out-of-pocket expenses, especially in the case of long transfers, are frequently more than an officer should be called upon to incur, and often amount to a distinct hardship. It is believed that the question was under the consideration of the Government of India some six or seven years ago and it is suggested that the question be again considered with a view to the present rules, which contain several anomalies, being made more liberal.

Mr. F. C. Rose, called and examined.

71,519. (*Chairman.*) The witness said he represented the Imperial Engineers of the Public Works Department in the Punjab. The Superintending Engineers whose names were on the written statement were asked to obtain opinions of Executive Engineers, and they met and discussed the views and endeavoured to draft something which was more or less agreeable to everyone. There were no Executive Engineers represented on the Committee, but the papers sent in by those officers were before the Committee in drafting the statement. They all agreed generally, the main point of divergence of those who signed a minority report being on the question of whether the Imperial and Provincial Services should remain as at present. The witness himself was of opinion that the division into two branches should continue in the interests of Government, and he held that opinion purely on economical grounds. He did not think any objection would be taken to having both services on one list and even to their being called by the same name. His objection was to the Indian recruited officer being paid on the same basis as the European recruited officer. He desired to emphasise the point that imported labour should be paid at a higher rate. As to whether salaries should be the same for all with something in the nature of a foreign allowance for the European officer his view would depend largely on the amount of the allowance. He did not mind by what name it was called so long as the difference existed. The witness pointed out that if he returned to England for duty his pay would at once be reduced to two-thirds according to the Civil Service Regulations. He thought the rule was a fair one and was now more or less established in India. It was difficult to gauge what the difference should be, but the general rule appeared to be that a man should expect two-thirds pay in his own country, and he advocated the maintenance of the two-thirds rule on the main ground that the Government had the right to expect to obtain indigenous labour cheaper than imported labour.

71,520. The witness supported the proposal by which all officers in the administrative grades should receive the same rate of pay, and admitted that in that respect the principle he put forward broke down. It was, however, always necessary to pay a good man. The best Engineers in England were very highly paid, but there was a great difference indeed between the rank and file and the man at the top. A man selected for the administrative grades had to be a very good man. Precautions were taken to promote really efficient officers and for the administrative grades a real selection should be made of the very best officers in the Department Men selected for Chief Engineers had the same pay whether they were recruited in India or in England, and he was in favour of extending this to Superintending Engineers. The cost of living was much greater for an officer coming out to India from England than for an officer living in the country.

71,521. The witness suggested a system of nomination and competition for Rurki instead of open competition as he thought on the whole it would give a better stamp of man if they were selected first. An efficient Nomination Board could be appointed consisting of men who knew what the requirements were.

71,522. The witness did not think that the cadre could be increased so as to absord all the temporary Engineers or such of them as were in effect doing permanent work. He would fix the cadre in accordance with ordinary normal requirements, that is to say, at such a strength that it would never be likely to be less than would be fully employed. The cadre was certainly not recruited to that standard at present. In the Punjab there were 63 temporary men and 145 permanent men. Even if all the construction works were closed down he did not suppose it would result in a decrease of four divisions. Taking four men to a division that would mean a decrease of 16 men, a number which he thought would fairly well represent what ought to be the strength of the temporary establishment. Forty or more officers were practically doing permanent work and he should like to see the cadre correspondingly increased. The witness said that in the Punjab Irrigation at present the divisions were too big and should be reduced in size. This would at once tend to prevent a block in promotion. He would increase the number of Executive posts in the divisions in the Punjab Irrigation, and he believed there was a proposal now before Government for doing that. Another method would be to do away with the charge bar at Rs. 800. It was difficult to say where the charge bar should come, but probably the thirteenth year of service would be the right time. The selection from Assistant to Executive rank ought to be stiffer than it was at present as there was not now a sufficient amount of selection for Executive posts. If a man was not fitted for an Executive post he should not be promoted. It was true that his scheme would not be of much value to those who were left behind, but they were left behind by their own fault.

71,523. He thought it would be quite reasonable to have a rigid selection within the grades, provided that the charge bar was raised from Rs. 800 to Rs. 1,000.

71,524. On the subject of the employment of Royal Engineers, the witness said Royal Engineer officers did not care for the Irrigation Branch, but he believed in the Buildings and Roads Branch instances had occurred of Royal Engineers being placed on the permanent cadre to the detriment of the civilians. At present some Royal Engineers came into the Department with from ten to fourteen years' service, when they were over thirty years of age, and they were placed above men who had been in the Department for some time. The ordinary recruit came out at about twenty-three or twenty-four, while the Royal Engineers obtained their commissions about nineteen. He did not think anybody had a word to say against the efficiency of the Royal Engineers. If the age was reduced to twenty-five it would have no injurious effect on the service and the officers would enter somewhere about the bottom of the list and the grievance would be removed.

71,525. The witness was of opinion that under no circumstances should an officer be retained beyond a certain age, but whether the age for superannuation should be 55, 57 or 58 was not a matter of great importance. The important point was to have a rigid rule and to stick to it. To keep on men after the age of retirement created great discontent in the Department. At present there was a definite rule of Government that a man should retire at 55 and all the officers asked that that rule should be strictly adhered to. Regarding the argument that it might be injurious to the Public Service to lose a valuable officer the witness said there were as good fish in the sea as ever came out of it.

71,526. With reference to Widow and Orphan pensions, witness stated he did not wish to argue the question as it was a very intricate subject and officers were not all agreed upon it.

71,527. As regards the question of general increase to the present scale of pensions witness desired to emphasize the fact that there was genuine discontent at present and all officers attached a great deal of importance to this matter.

71,528. (*Mr. Madge.*) The witness said that if the best of the temporary Engineers were brought on to the permanent cadre and the number of charges were correspondingly increased it would in a great measure remove the present difficulty. The temporary men were taken on for temporary schemes, and as fewer men were required for maintenance, there was supposed to be a reduction in their number after the work on new construction was completed, but, as a matter of fact, as soon as one scheme was finished another scheme was started and the temporary men were kept on. He thought it was necessary to have a certain proportion of temporary men.

71,529. The witness said he had had men of the domiciled community working under him and could say with perfect honesty that one of the very best men he had had under him was a domiciled "Native." This remark must, however, not be held to apply to all. Good men were to be found among the domiciled community, but there were some very indifferent men as well.

71,530. (*Mr. Macdonald.*) The witness thought that the difference between the class of men now recruited in India, and the class recruited formerly might to a slight extent be due to the division of the service into Imperial and Provincial, but he spoke on the subject with all reservation. In his view the difference was owing in great measure to a change of nationality, as the men who were recruited formerly came in many instances from England to Rurki.

71,531. (*Mr. Sly.*) The witness said the figures he had given of the permanent and temporary staff referred to the whole of the Punjab, Roads, Buildings and Irrigation.

71,532. It was claimed by the Public Works officers that there should be no difference in pay or pension between Civilians and the Royal Engineers. He admitted Royal Engineers had obligations which did not fall on the Civilians, but considered that it must also be admitted that many of them were never called upon to carry out those obligations. Personally he would be prepared to take the same obligations upon himself, if asked to.

71,533. (*Mr. Chaubal.*) The witness would not admit that if England turned out as many Engineers as at present and there were no openings for them in India the law of supply and demand would come in and the remuneration in England fall. There was no profession in England of any kind which found employment altogether in England; England supplied Engineers to all the world. He did not think that throwing on the market twenty-two men a year would make any difference.

71,534. (*Mr. Aikman.*) With regard to the statement that the proportion of Indian recruited officers reaching administrative rank up to 1892 was higher than the similar proportion of officers recruited in England, the witness said the average number of years of service before an officer obtained administrative rank was twenty-two or twenty-three. Coeper's Hill was started in 1870, and the course being three years, the first batch of men came out in 1873, so that by 1892 they would have only had nineteen years' service. He could not say how many Cooper's Hill men were recruited up to 1892, but recruitment began at the rate of about 50 a year and by 1892 must have fallen to about 30, so that probably between 300 and 400 Coopers' Hill men were recruited during the period in question. Up to 1892 the men who qualified for administrative rank were men who had been educated at Rurki. The only men recruited from England before 1870 were the Stanley Engineers, a body of 40 men, and they were the only English-trained men that were qualified for promotion to rank of Superintending Engineer.

(The witness withdrew.)

Rai Bahadur Ganga Ram, c.i.e., m.v.o., late of the Public Works Department, Punjab. (Retired.)

Written Statement relating to the Public Works Department.

71,535. (I.) **Methods of Recruitment.**—The present method of recruitment to the Imperial Service of the Public Works Department is in my opinion exceedingly faulty. There is no searching examination to test the candidate's capabilities in such subjects as are likely to be of use in India. Mere qualification of A.M.I.C.E., or a diploma of any engineering college in England, regardless of subjects, entitles a candidate to apply for the appointment, and there being no subsequent examination before or after the selection, there is absolutely no criterion of the candidate's capability or relative merits. In such circumstances, and in the absence of any special institution like the old Cooper's Hall College, the training of the Indian colleges must necessarily turn out superior men for the Indian Public Works Department, to those recruited in England.

Remedy.—(*a*) For recruitment in England there should be first nomination and then competition. The present selection committee should be converted into a nomination committee, and should be composed of one member of the Secretary of State's Council to act as president, and the other two members should be nominated annually by the Secretary of State from amongst retired engineers, shortly before the date of nomination.

(*b*) There should be at least three nominees for each vacancy, and the result should be decided by open competition without any regard to the candidate's nationality.

(*c*) Candidates must be graduates in B.Sc. in engineering or A.M.I.C.E.'s, or passed engineers from any of the Indian Engineering Colleges.

(*d*) The subjects of competition should include a thorough knowledge of the great works constructed in India, in roads, buildings, canals, railways, waterworks, and drainage works.

(*e*) Practical training in England should be confined to sanitary engineering only.

(*f*) Hindustani should be one of the subjects.

Fifty per cent. of vacancies should be given to recruitments in England, and 50 per cent. to recruitments in India.

71,536. (III.) **Conditions of Service.**—All recruitments for permanent vacancies, whether made in

England or in India, should be classed as Imperial. The distinction of Imperial and Provincial should be abolished, and the conditions of recruitment and service should be the same for Europeans and Indians, except in regard to pay and leave, which I have explained later on.

71,537. **(IV.) Conditions of Salary.**—The salary of permanent men doing similar work should be the same for Europeans as for Indians, but it is only fair that a European, as versus Indians and domiciled Europeans, should get an extra allowance because of the fact of his having to educate his children in Europe, and the expenses he has to incur in his family moving between Europe and India. This allowance should be given to non-domiciled Europeans, irrespective of the place of recruitment, under some such rules as used to be in vogue during the days of exchange compensation allowance. This allowance which I now recommend may be called "foreign service allowance," and should be equal to 15 per cent. of salary.

71,538. **(V.) Conditions of Leave.**—The present conditions of leave are quite good, but they require one modification, namely, that the conditions of leave should vary as to whether leave is spent in Europe or India, and not with any reference to nationality or place of recruitment. To make my meaning clear, if an Indian wishes to spend his furlough in Europe he should get the favourable leave rules, but if he spends it in India, the present rules ought to be sufficient for him.

71,539. **(VII.)** (*a*) **Limitations in the employment of Non-Europeans.**—There should be absolutely no limitation; open competition must be the rule, and no race distinction.

(*b*) **Working of the existing system of division of services in the Public Works Department into Imperial and Provincial.**—The existing system has led to nothing but discontent and hostility, and the word Provincial has become a sort of slur to one who happens to belong to this service. I quite recognise the necessity of having another service with lesser responsibilities and consequently inferior pay. This necessity is now met partly by Provincial service and partly by the recruitment of temporary men, whose lot is extremely deplorable, as they can be discharged at a month's notice, at any time, and whose method of recruitment is extremely unsatisfactory. To meet this want, as well as to meet another want which is very serious, namely, the engineers required for municipal and local boards, I propose the creation of another service, to be called Extra Engineering Service, whose salary should be graded, and should be 66 per cent. of the Imperial men. This service should carry no pension, but a provident fund system. This service should be recruited in England as well as in India, half and half, from those who fail to get into the Imperial. Out of the Imperial vacancies one or two vacancies may, every year, be given to men of extraordinary merit of the Extra Engineering Service, as a sort of encouragement. Thus the existing *Provincial* and *Temporary* services be abolished altogether. If any men are still required for temporary jobs, they should be called clerks of works, and should be charged direct to works.

RAI BAHADUR GANGA RAM called and examined.

71,540. (*Chairman.*) The witness said he retired from the Service as an Executive Engineer, first grade, permanent, in 1903, after serving 30 years in the Public Works Department in the Punjab. He was trained at Rurki and entered the Service in October 1873. When he passed out of the College twelve Europeans and six Indians passed out at the same time. There was only a two years' course then and he did not remember the number of students in the College.

71,541. The witness was in favour of the abolition of the Provincial Service as it now existed and the creation of an Imperial Service half recruited in England and half in India, and he thought that a sufficient number of Indians were now qualified to fill half the total number of vacancies. He favoured limited competition amongst nominated candidates in England and an examination which would require experience of Indian subjects. He did not think that would give preference to Indians, because English Colleges would put the subjects in the curriculum if they knew that a certain number of their students were going in for the competition. It did not follow that by this scheme fifty per cent. of Indians would enter the Service, because the Indian recruitment of fifty per cent. would also include Europeans and Anglo-Indians.

71,542. With reference to the employment of Royal Engineers, the witness was of opinion that such officers did not care to enter the Public Works Department, but he had not considered the question sufficiently to offer any definite opinion.

71,543. With regard to training, the witness considered there would be an advantage in allowing officers recruited in India to have a period of probation in England. He would not make it compulsory on all students because all of them could not afford to go. If, however, they were sent on full pay they should all be asked to go. He thought the best time to send them would be after four or five years' service. He himself went to England after ten years' service and found it very useful. In England he specially qualified himself in Sanitary Engineering, Water Works and Drainage Works and on his return designed and constructed many such works.

71,544. With reference to his proposal for the creation of a new grade of Temporary Engineer, the witness said he would prefer to call them Extra Assistant Engineers. The Civil Service had Extra Assistant Commissioners who practically did the same work with a little less responsibility, and economy to Government resulted. He would therefore create an Extra Assistant Engineer Service which would include all the temporary men of the Department and also the men now employed by District Boards and Municipalities. The Temporary Engineers transferred to the Extra class would be more or less permanent on the Provident Fund system, carrying no pension, and would have a much better standing. He would recruit them from among the unsuccessful candidates of Rurki and English Institutions, taking 50 per cent. from India and 50 per cent. from England, men who were qualified for but unable to get appointments in the superior service. He would have promotion from the upper subordinates but they would be promoted to the extra service and not to the permanent service. He did not consider the upper subordinates were qualified to enter the superior service, and he did not think their tone was as good as that of officers in the superior service.

71,545. The witness said there was work in the Department which in his opinion was somewhat more responsible than that discharged by officers in the upper subordinate service but somewhat less responsible than that of the Assistants who were doing regular work. He instanced the work of Engineers of District Boards and in the employment of smaller Municipalities. Larger municipalities would require highly trained Engineers, but 80 per cent. of the Municipalities would only require ordinary men whose work would lie mainly in the construction of small buildings, such as schools, and the maintenance of roads. He desired to bring such men under one category, as at present recruitment was not based on any fixed principle. If a man was engaged by a small Municipality at Rs. 200 a month he had no prospects at all, but when he came on the extra list he might be moved from one place to another and would have a wider field for promotion. At present if a man was in a difficulty with a Municipality he was dismissed straight away and had no chance of being sent to another Municipality. He thought the pay of such a Branch should be from half to two-thirds of the Imperial pay, starting at Rs. 200 and rising to Rs. 600 or perhaps in rare cases to Rs. 800. He did not think his proposal would cause any discontent; there had been none in connection with the Extra Assistant Commissioners in the Civil Service.

71,546. With regard to salary, the witness said there was justice in recognising that an officer from Europe should receive something more than an officer recruited in India. For the last four or five years he had spent every summer in England and had had many conversations with Englishmen, and when asked by them the reason of the gulf between Indians and Europeans, he had replied that the Indians generally felt they did not get men of high class who were sympathetic with the Indian people; and he was told that to get better men from England the pay must be high. It was for that reason that he advocated extra pay. He had calculated that there were forty appointments every year and he believed that if twenty of the appointments went to India and twenty to England there would be no objection to giving the Europeans extra pay and thus ensuring the employment of men of very high class. He was not prepared to say whether such a scheme of pay would be received with general acceptance by Members in the service.

71,547. (*Lord Ronaldshay.*) The witness was of opinion that an Indian would be in a better position to benefit from study in Europe after he had had some years of practical service in his own country than by going to England as a student.

71,548. With regard to leave, his suggestion was that the conditions of leave should be governed not by the nationality of a man but by the country in which the leave was taken. An officer would have to elect at the outset where he was going to take his leave.

71,549. (*Sir Theodore Morison.*) The witness said his proposal was to provincialise the Provincial District Engineers and all the temporary Engineers now employed by the Department. There was a considerable quantity of work which was midway between superior work and subordinate work, as for instance sub-divisions in which very little Engineering was required. For example, when a canal was being worked there were revenue sub-divisions whose chief duty it was to distribute water to the zemindars and collect water rate, and those things could be well done by temporary engineers. He thought the maintenance of railways might be classed in the same manner though his experience of railways was not very great.

71,550. With regard to foreign service allowance, the witness considered that 15 per cent. would be in a way sufficient to tempt a man to leave his own country, as it would just meet the extra expense incurred by the moving of a family.

71,551. (*Mr. Chaubal.*) The witness said that after thirty years' service his permanent salary was Rs. 1,100 but he received in addition an allowance of Rs. 150, whilst employed on the Delhi Durbar of 1903. When the last Public Service Commission's recommendations were put forward Indian Engineers previously in the Service were not affected by the changes that were introduced; they remained on under the old rules. He had never risen to Superintending Engineer's grade and no Indians had risen to that grade in the Punjab. He was never superseded.

71,552. With reference to his scheme for Extra Assistant Engineers, the witness said that the Engineers of Municipalities and District Boards were now paid out of Municipal funds, but under his scheme the pay would be debited to the Municipality by the Government, who would make the appointments. He saw no difficulty in having in a Government Department a number of officers working under different Municipalities and District Boards. If a Municipality was only able to pay an Engineer Rs. 100 it could have a subordinate; if it could afford to pay Rs. 200 it could take the lowest class Engineer; more than half the Municipalities and District Boards in the Punjab were employing Engineers drawing more than Rs. 200.

71,553. The witness did not agree with the statement that Indian Engineers were generally lacking in energy, power of organisation, initiative, resource, ability to control, and fairness in dealing with subordinates. He was not in favour of a separate scale of salaries for a Provincial Service as he wanted to have only one Service. He should continue the present Imperial pay subject to increases he had recommended and the Foreign Service allowance for pure Englishmen should be 15 per cent. above that. His idea was to amalgamate the present Provincial Service with the Imperial and to have an Extra Service, the highest pay in the new Service being Rs. 800.

71,554. (*Mr. Fisher.*) The witness considered that the Public Works Department obtained the pick of the Indian trained Engineers, the second best going to the temporary establishment of the Public Works Department, and the third best going to Municipalities. He considered Municipal Engineers would be glad to be taken into the Public Works Department. He did not propose they should be pensionable but that they should have a Provident Fund.

71,555. (*Mr. Macdonald.*) With reference to his proposal that students in England should be examined on Indian subjects, the witness said the knowledge would only be that acquired from text-books and would be on a par with that which was obtained in Cooper's Hill. Hindustani would be valuable all over India from Madras to the Khyber. Should a man ultimately not succeed in entering the Indian Service he did not think it would have done him any harm to have studied Hindustani.

71,556. (*Mr. Madge.*) The witness was of opinion that Sanitary Engineering was the only subject that could be studied better in England than in India.

71,557. (*Mr. Abdur Rahim.*) The witness said his experience led him to believe that if a large number of Indians were introduced in the Public Works Department the Service would not suffer in efficiency. They had already been employed on Buildings, Roads, Irrigation, and other work, and had shown no lack of ability in doing it. They had also been employed in the Punjab up to the grade of Executive Engineers on the construction of canals. The reason why the witness did not serve his full time in the Service was because he received a grant of land after finishing work in connection with the Coronation, and as he could not obtain the grant until he retired he preferred to retire rather than to wait.

71,558. (*Mr. Aikman.*) The witness said he thought the class of Engineer at present employed by Municipalities like Lahore, Amritsar and Delhi, would accept the pay and status of the Extra Assistant Engineer class he proposed. At present higher salaries were paid because there was no source of recruitment except from outside. The witness recommended the present Imperial scale for Indians and an extra 15 per cent. above that scale for pure Englishmen, provided the percentage of Englishmen was not more than 25.

71,559. (*Mr. Laughran.*) The witness said he had not stated that the work of a sub-division in the Irrigation Department was inferior but that the Revenue Sub-Division did not require much Engineering skill.

(The witness withdrew.)

LALA WAZIR CHAND CHOPRA, Executive Engineer, Punjab.

Written Statement relating to the Public Works Department.*

71,560. (I.) **Methods of Recruitment.**—This head naturally sub-divides itself in two sub-heads, namely: (*i*) Sources of Recruitment, and (*ii*) System of Recruitment.

(*i*) *Sources of Recruitment.*—The two principal sources of recruitment at present are:—

(*a*) Appointments in England by the Secretary of State, under the advice of a Selection Committee;

(*b*) Appointments given to more successful students of Indian Engineering Colleges.

When the last Public Service Commission sat, annual recruitment on the average was 21 men from source (*a*) and 9 men from source (*b*), *i.e.*, 70 to 30 per

* See also the "Views of the Provincial Service Engineers" appended to the Report of the Imperial Engineers—paragraphs 71498-505.

cent. The Commission then was of opinion that the proportion of recruiting from Indian colleges was inadequate and that this proportion should be gradually raised. On the contrary we find that the proportion of recruitment from Indian colleges has actually decreased. Thus at present the average recruitment from the two sources is, 30 from source (*a*) and 9 from source (*b*), *i.e.*, in the ratio of 77 to 23 per cent. If the recommendations of the Commission had been given effect to, the proportion of recruitments would have by this time been more than half for men from Indian colleges.

It is recommended, therefore, that proportion of recruitment should for the present be made half to half, and as time advances this proportion should rise in favour of the *alumni* of Indian colleges. Engineers have, in the design and execution of Public Works of all descriptions, to deal with local conditions. The Engineering practice, standards, and problems of a large country like India are peculiar to that country. Hence the Engineers who have received their professional education and training in the country itself, suit that country best. At present India possesses first-rate Civil Engineering Colleges, one of which is over 60 years old. It is very necessary, therefore, that the bulk of recruitment should be from Indian colleges; and rather than get recruits from outside in large numbers, the proper policy would be to keep the standard of the Indian colleges abreast of the times, *i.e.*, up to the highest standard of Engineering practice and theory in the world.

(*ii*) *System of Recruitment.*—At present the recruitment in India is by competition, and in England by selection from amongst men trained in the colleges there. The proper system would be by competition in both countries. For the competition to be real and searching the number of appointments in any year should not exceed one-third of the number of candidates in that year.

There is one point, which it is necessary to bring to the notice of the Royal Commission specially. *At present the outside age limit for Rurki Admission* Examination is 21 years, and the candidate is required to be a graduate. *In the Indian Universities the age limit for marticulation examination is 15* or 16 years. Hence a student can not become a graduate until after he is over 19 or 20 years of age. The Rurki College Admission Examination takes place before the results of the Degree Examinations of the *Punjab University are out. Hence the candidate at best has one chance only for appearing in the Admission Examination if 15 years be the rule for marticulation, and none at all if 16 years be the rule. This anomaly* must be removed and the simplest remedy is to lower the University standard for admission to Rurki Engineer Class from B. A. to Intermediate in Arts, as was the case some years back.

71,561 (II.) **System of Training and Probation.**—The system of training in vogue in Indian colleges is as it should be. The training is wholly directed to the requirements of the country, in colleges maintained by the State for the purpose. By the competitive system prevalent in these colleges, the best men available are chosen. The training in England is not wholly directed to the requirements of India. To remove this defect the competition examination in England should include in its curriculum—(1) One Indian Language, (2) Indian Irrigation, and (3) Indian geography, Physical and Political.

The training received by the *alumni* of Indian Engineering Colleges, is further supplemented by a period of probation for one year in the Department, which is not the case with recruits obtained from England. This probationary period in the Department in India is absolutely necessary, and should be insisted upon as an indispensable condition. It should be a probationary period in the true sense, involving selection and possibility of rejection at the end of it. Any plea that this is unfair, or will deter candidates from England by reason of the attached risk, may be met by the provision of free return passages to rejected candidates. Such a system of rejection prevails at present for recruits from the Indian colleges. But the present system at Rurki College of posting two apprentices for each vacancy and selecting one of them at the end of the preliminary period of one year should be done away with, and the system of sending out one apprentice for each vacancy that prevailed up to 1899, should be restored.

71,562. (III.) **Conditions of Service.**—The conditions of service as at present prevalent for the Imperial Engineers are quite satisfactory. Prior to the adoption of the recommendations of the last Public Service Commission, practically the same conditions applied to recruits from Indian colleges,—in fact they entered the Imperial Service and no Provincial Service existed. For reasons explained under head VII (*a*) (paragraph 71,566) *infra*, all distinctions as regards conditions of service between recruits from England and those from Indian colleges should be completely removed, and equality of treatment restored.

71,563. (IV.) **Conditions of Salary.**—The pay of the Indian recruited element is approximately two-thirds of that granted to officers recruited in England. This is utterly unfair and unsuitable. The resulting anomalies and defects are startling and are as follows:—

(*i*) The minimum pay of Indian trained Executive Engineers is much less than the maximum pay of Imperial Assistant Engineers who might be working under them.

(*ii*) The minimum pay of Indian trained Superintending Engineers is less than the maximum pay of Imperial Executive Engineers who might be holding divisional charges under them.

(*iii*) Anomalies existing in connection with local allowances as stated below.

(*iv*) In addition to the above, the pay granted to the Indian trained element is inadequate and is not commensurate with their work and responsibilities, which are exactly the same as those of the Imperial Engineers. That the Indian trained engineers should, under the conditions now prevailing, receive less pay *than their own juniors and subordinates is simply preposterous and untenable.*

It is pointed out that emoluments should depend solely on services rendered, and that all distinctions between two classes of officers who do the same work and bear the same responsibilities should be obliterated.

Local allowances.—Indian trained Engineers receive two-thirds of the local allowances granted to Engineers *obtained from England.* This difference is unfair, *for the said allowances are always given for a specific purpose, viz., as compensation for local disabilities which equally affect both classes of officers.*

Probationary period.—Not only have Indian trained officers, as already explained, to undergo a probationary period and incur the consequent risk of rejection, but even after completing such probation the period so spent is not counted for increment and promotion. This causes great inequality between the two classes of officers.

It is urged that there should be absolutely no distinction in the matter of emoluments of whatever nature, between the two classes of officers, as they do the same work.

71,564. (V.) **Conditions of Leave.**—There should be no difference in the matter of leave between officers recruited in England and those recruited in India. Although it is necessary that the best preliminary training ground for an engineer is his own country, there is no doubt that he is always in necessity of enlarging his horizon of experience by visiting important engineering works in other countries. This will keep him abreast of the times in his technical knowledge. This object can only be attained if leave rules are liberal. Again, the conditions under which engineers have to work are such that, unless allowed long periods of rest, their health is likely to break down. It is recommended, therefore, that the leave rules for all engineers whether recruited in England or India should be the same.

78,565. (VI.) **Conditions of Pension.**—As in the case of salary so in the case of pension, there should be no distinction whatever between engineers recruited in England and those recruited in India. Pensions are really deferred salaries, and it is but fair that they should depend on specific services rendered and

not on place of recruitment. The scale of pension recommended for all Engineer officers is as follows:—

Years of completed Service.	Scale of Pension (Proportion of average emoluments).	Maximum amount to be allowed.
		Rs.
10	20/60	2,000
11	21/60	2,200
12	22/60	2,400
13	23/60	2,600
14	24/60	2,800
15	25/60	3,000
16	26/60	3,450
17	27/60	3,900
18	28/60	4,350
19	29/60	4,800
20		5,250
21		5,700
22		7,150
23		6,600
24		7,050
25	30/60	7,500
26		8,100
27		8,700
28		9,300
29		9,900
30		10,500

An officer may be allowed to retire at any time after completing 20 years' service.

71,566. (VII.) (*a*) **Such limitations as may exist in the employment of Non-Europeans.**—As urged above the department should be recruited half from England and half in India for the present. The recruitment in England should be open to all British subjects equally, irrespective of domicile, colour, caste or creed. Latterly, during the existence of Cooper's Hill College, only two Indians were eligible for appointment even after competition, and at present the number of Indians eligible for appointment in England is limited to only ten per cent. of the total annual recruitment. Limitations of this nature should be removed.

(*b*) **Working of the existing system of division of services in the Public Works Department into Imperial and Provincial.**—The division of the Public Works Department into Imperial and Provincial Services has been a great mistake and has not been and can never be a success. This division took place on the recommendations of the last Public Service Commission. The grounds on which the Commission based its recommendations and remarks on them, are given below:—

(*i*) The Commission was of opinion that the considerations which, in respect of Judicial and Revenue Branches of the Administration led it to recommend the formation of Imperial and Provincial Services with distinct conditions of service, applied with equal force to the Department of Public Works. Now prior to the introduction of the Provincial Service in 1895, the recruits from Indian Colleges were admitted unreservedly into the Imperial Service. This vested right was interfered with by the Commission, which was really appointed to devise measures for the employment of Indians on a larger scale in the higher grades of service in all departments, and thus in a way raise the status of Indians in the services. In the case of the Public Works Department, the recommendation for the introduction of a Provincial Service was a retrograde measure, and thus the Commission evidently went contrary to its terms of references in this case. But apart from the above, there is really no analogy between provincial branches of other services and Indian trained engineers. Engineers recruited in India belong to a Superior Service, and do the same work and bear the same responsibilities as engineers recruited in England; while this is not the case with members of other Provincial Services. In the case of Engineers, those recruited in India have been borne on the same list with those recruited from England and promoted side by side with them; while in other departments the lists have always been separate. This want of analogy was virtually admitted by the Government of India, when giving effect to the recommendations of the Commission.

(*ii*) The Commission was of opinion, that important charges, especially of Direction and Control, should be held by men recruited from England, while inferior charges should be held by men recruited from India. This assumes the existence of superior and inferior charges, while the fact of the matter is that such distinctions in charges, excepting very rare cases, do not exist. All Executive and Administrative charges during the quarter of the century that has elapsed between the last Public Service Commission and the present one, have been held promiscuously by men recruited from India and England. For the execution of the famous Triple Canal Project in the Punjab, for instance, the charges on the whole have been held much longer by Rurki Engineers than by those recruited from England, the ratio of total periods on the three canals during which charges have been held by Rurki and England trained men respectively being about 1½ to 1 in the case of Executive Engineers, and about two to 1 in the case of Superintending Engineers. The recommendations of the Commission in this respect, as implied by their opinion, were not followed, because they were really impracticable. Even in the Roads and Buildings Branch, the idea of employing men of inferior status could not be given effect to—Imperial Engineers are still in charge of Roads and Buildings Divisions.

(*iii*) The Commission was of opinion that Colleges in India were not capable of affording such a high standard of education as was obtainable in Colleges in England such as Woolwich, Chatham, and Cooper's Hill. Experience has proved that this notion of the Commission was not correct. Some of the *alumni* of Rurki College have risen to great eminence—the names of Sir W. Wilcocks, Sir W. Garstin, and Rai Bahadur Ganga Ram may be instanced in this connection. Leaving alone exceptonally good men like the above, it will be noticed that the proportion in administrative ranks of Indian trained Engineers to England trained Engineers is better than the proportion of their respective original recruitments. Now as promotion to administrative ranks is by selection only, it follows that the Indian College Engineer has proved himself on the whole as better and fitter than his English confrère in the race of official life. A close examinatoin of classified lists over a series of years will bear this statement out. Again, some of the best authorities in the land have borne testimony to the Rurki College being equal to any similar institution in Europe, to the excellence of the Institution, and to the great ability of its *alumni*. It is claimed therefore that there is no difference between the profesional education imparted in Rurki College and that received by the average engineer recruited in England.

All the above leads to the conclusion that the introduction of the Provincial Service in the Public Works Department was really a mistake. Other considerations bearing on the subject are:—

(*a*) Considering the previous history and qualifications of Indian College Engineers, they should be treated just as Indian recruited officers of some other superior Services like Accounts, Traffic (Railways), Finance, etc. (in which by the way the educational qualities required are inferior to those of the Indian College Engineer) are treated. These Services are also partially recruited in India, but all officers, whether recruited in India or England, are classed as Imperial.

(*b*) A number of temporary engineers, at Rurki men, long after the introduction of the Provincial Service, were made permanent and placed not in the Provincial but in the Imperial Service. They did not get guaranteed appointments, and the majority of them had failed even to secure the necessary percentage of marks required to qualify for Government appointment. If out-classed people from Rurki College, who in addition were only eligible for the Provincial Service are held to be fitted for the Imperial Service, the pick of the Indian Colleges certainly should be.

(*c*) There have been cases where men who could not either pass tests in, or secure Government appointments from, Indian colleges have proceeded to England and after undergoing a very meagre training

for a short period at places like Crystal Palace, have been appointed by the Secretary of State to the Imperial Service. How, then, in the name of fairness can the pick of the Indian Colleges be barred from the Imperial Service?

(*d*) The institution of the Provincial Service for Indian College Engineers was in direct opposition to a definite pledge given to them in a speech delivered by Sir William Muir, Lieutenant Governor of the North-Western Provinces at Rurki on the 28th November, 1873, of which the follow is an extract. ". . . But apart from personal associations, there is a reason which renders the present moment one of public interest; the establishment in England of an Engineering College for India has unsettled the minds of the public here as to the prospect of this institution and the continuance to it of the patronage of Government. It has been a subject of much anxiety to myself, and of correspondence with the Government of India. It is, therefore, with sincere satisfaction that I am able to announce to you and through you to those without who are interested in the Thomason College, that the institution at Cooper's Hill will in no degree affect the relations of the Government of India with the college, nor the employment which has been hitherto guaranteed to its more successful students. Between the two seminaries there will be no opposition or antagonism. The requirements of this great country are ample for both. I am sure that you will all with me be thankful to the Governor General in Council for the justice which has thus been rendered to Rurki College."

This pledge was given shortly after the institution of Cooper's Hill College, at a time when the public in India were naturally apprehensive that the position of the *alumni* of the Indian Engineering Colleges in the Public Works Department would be injuriously affected, and it will be observed that it was given with the full authority of the Government of India, and possibly also of the Secretary of State. It will be noticed that the Government pledged that the institution of Cooper's Hill would in no degree affect its relations with Rurki College, nor the appointments "*hitherto guaranteed*" to its successful students. The appointments "*hitherto guaranteed*" were in the Imperial Service. Yet notwithstanding this pledge the Provincial Engineer Service, creating a great distinction between Engineers recruited in England and India, was introduced 20 years later and was based to a great extent on a mistaken comparison of the respective merits of Cooper's Hill and Indian trained Engineers. Again, it must be noted that this pledge, which is recorded in the Rurki College Calendar of 1872-73, formed one of the strongest inducements to candidates to enter Rurki College, for these men naturally believed (and it was a legitimate belief for them to nourish) that the distinction created was merely a tentative measure, and that when the organization of the Engineer Establishment came to be reconsidered, in accordance with paragraph 10 of the resolution No. 2523 G. of 1893, the said distinction would be abolished.

Public Works Department.—Thus from all considerations it is evident, that the existence of the Provincial Service in the Public Works Department stands self-condemned. It was introduced as a tentative measure for 7 years, and ever since the expiration of this specified period in 1902, a strong and persistent agitation has been going on for its abolition. The changes made in 1908, far from removing the prevalent discontent caused great resentment. Further improvements made in 1912 are considered as restoring the Provincial Service to the status it had before 1908. But the real cause of discontent still remains, and it will be removed only when the Provincial Service is abolished.

The pay and conditions of service should be commensurate with services rendered, and when Engineers from Indian Colleges have been and are doing the same work as those recruited from England, there is no reason why their place of recruitment should bar the former from the advantages of the Imperial Service.

It is strongly urged, therefore, that the Provincial Service in the Public Works Department should be abolished without loss of time.

71,567. (IX.) **Other Points.**—The question of cost, if the Provincial Service were abolished, may be briefly considered. The total monthly salary in the department at present amounts to Rs. 7½ lakhs in round numbers. If all the Provincial Officers were made Imperial, the extra cost would be half a lakh of rupees per month, the increase will be only 6·3 per cent. During the last quarter of a century (1885–6 to 1910–11) the general revenues of the country have risen from 7,446 to 12,102 lakhs and those of the Public Works Department alone from 743 to 2,653 lakhs. It will be seen that the proportional increase of Public Works Department revenues is about 4 times that of the general increase of revenue, and it is a sound business policy, that the employees of the department should have a share in this increase of revenue. An increase of 6 lakhs of rupees per annum on establishment due to the abolition of the Provincial Service would be infinitesimal as compared with the increase of Public Works revenue. It may also be pointed out that according to the Public Works Department Code, the theoretical percentage for Establishment on works was 23 till lately, and 21½ now, but in practice this percentage works out to from 16 to 19—or 17½ on the average. Thus there is a saving of 4 to 6 per cent. of the cost on works, in the matter of Establishment. This saving alone can very nearly meet the extra cost of 6 lakhs of rupees per annum mentioned above. Thus, on the score of cost also, the Provincial Engineer Service can be safely abolished.

LALA WAZIR CHAND CHOPRA called and examined.

71,568. (*Chairman.*) The witness said he was an Executive Engineer in the Provincial Service, Public Works Department, and represented the officers in that Department. He believed the views expressed in the written statement were generally agreed to by the officers.

71,569. The witness was of opinion that Indian Colleges turned out men better fitted for the Public Works Department in India than English Engineering institutions, the education in the Indian Colleges being directed more to the requirements of India. His reason for suggesting that 50 per cent. should be recruited from English institutions was in order that the change might be gradual. He desired to see competition among selected candidates in England for about half the vacancies and that Natives of India should be eligible for examination in England as well. *The examination should include an Indian language, Indian Irrigation and Indian geography. This would ensure that English officers on arriving in India would know at least one Indian language and have a text-book knowledge of Indian irrigation, and an idea of the geographical and climatic conditions of the country.* He did not think that would give an undue preference to the Indian. The subject of Indian irrigation would be theoretical for both classes of students and the language standard would be only colloquial.

71,570. He had facts and figures to show that the proportion of Indian-trained Engineers to English-trained Engineers, who had reached administrative rank was greater than the proportion of their respective original recruitments, and he would place those facts and figures before the Commission.*

71,571. The witness declared that at present the period spent by Indian-trained Engineers on probation did not count for increment and promotion, and he wanted that altered so as to equalise the conditions with those of the Imperial Engineers, who had no period of probation in the Department. The Imperial Engineer came from England and had no probation while an Indian recruit had to undergo a year's probation and was liable to be rejected. If he was not rejected it was only fair that the period should count towards increment and promotion, and the salary should be the minimum pay of an Assistant Engineer.

71,572. The witness desired to assimilate pension conditions for all officers of the superior service and

* *Vide* Appendix No. II.

therefore would ask for the privilege of optional retirement after twenty years' service. He himself would wish to retire after twenty years and he did not know what harm retirement at that time would do to the Service.

71,573. If the whole of the Provincial Service were absorbed into the Imperial Service and all were paid alike the witness considered the saving in Statement charges of four to six per cent. on the cost of works as explained in the written memorandum would nearly meet the whole charge. He had figures of actual expenditure on Irrigation Works in the whole of India extending over ten years, and they showed that if the four to six per cent. were applied, it would amount to about six lakhs, so that the extra cost would be met from this saving alone. His authority for quoting the theoretical percentage of Establishment charges, was the P. W. D. Code.

71,574. (*Sir Murray Hammick.*) With regard to leave the witness desired that all officers, Indians and Europeans, should receive the same, and he should like officers to go to foreign countries as well as to England. It was not likely that officers on leave would spend long periods in India, as they would have to do so on half salary. He did not think it was necessary to have any condition that the more favourable rules should apply only in case men went to England, because the percentage of people who would take long furlough and not go out of India would be very small, and therefore it would not be advisable to have any invidious distinction on paper.

71,575. (*Mr. Abdur Rahim.*) The witness said the age for matriculation in the Punjab was fifteen and men could graduate at the age of nineteen. In the United Provinces the age limit for matriculation was sixteen and for graduation twenty. He himself entered the Provincial Service at the age of twenty-two as an apprentice Engineer. He believed the maximum age for permanent pensionable appointments was twenty-five, and that gave a man ample time to earn his full pension. He believed Imperial recruits came out below the age of twenty-five. If instead of reducing the standard to the Intermediate, the age for admission to Rurki was raised to twenty-two it might solve the difficulty to a certain extent. The lowering of the standard of qualifying examination for admission to Rurki, was one remedy that suggested itself to him; he was not keen ont it.

71,576. (*Mr. Madge.*) The witness said he would not object to introducing the High School standard for Rurki as an alternative to reducing the B.A. to the Intermediate.

71,577. (*Mr. Macdonald.*) The witness explained that the arguments put forward in the written statement were in favour of increasing the Provincial pay, and not in favour of reducing the Imperial pay, as the present salaries were very inadequate. With regard to the possibility of the Provincial Service pay in India being better than the pay of Engineers doing similar work for large municipalities in England, the witness said he could offer no opinion upon that without out a knowledge of the conditions that obtained in England. For reasons best known to the statesmen of the country the Indian Services were the best paid in the world and he did not see any reason why Engineers should be less highly paid; and he, because he was an Indian.

71,578. (*Sir Theodore Morison.*) The witness said he laid stress on the question of the age of entrants owing to the fact that candidates were required to be graduates. A school-leaving examination would be of no value in the Punjab as that did not obtain in that Province. He was not aware that a boy could get into Rurki under the present rules at the age of seventeen, by passing the school final examination, and if the grievance was only peculiar to the Punjab and not applicable to the majority of provinces then the grievance was very much mitigated.

71,579. (*Mr. Aikman.*) The witness said that it had been the practice of large municipalities such as Lahore, Amritsar and Delhi to obtain English-trained men as Municipal Engineers, mainly for the reason that sanitary engineering was better developed in England and the duties of a Municipal Engineer were mostly sanitary.

71,580. With reference to the question of teaching an Indian language to students, the witness said the method adopted for the Indian Civil Service might be adopted for the Public Works Department.

(The witness withdrew.)

At Delhi, Wednesday, 19th November, 1913.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman.*)

THE EARL OF RONALDSHAY, M.P.
SIR MURRAY HAMMICK, K.C.S.I., C.I.E.
SIR THEODORE MORISON, K.C.I.E.
SIR VALENTINE CHIROL.
MAHADEV BHASKAR CHAUBAL, ESQ., C.S.I.
ABDUR RAHIM, Esq.
WALTER CULLEY MADGE, Esq., C.I.E.
FRANK GEORGE SLY, Esq., C.S.I.
HERBERT ALBERT LAURENS FISHER, Esq.
JAMES RAMSAY MACDONALD, Esq., M.P.

And the following Assistant Commissioners:—

D. W. AIKMAN, Esq., Superintending Engineer, Punjab.
J. W. B. LOUGHRAN, Esq., Executive Engineer, Punjab.

R. R. SCOTT, Esq., (*Joint Secretary*).

LIEUTENANT-COLONEL E. H. DEV. ATKINSON, Principal, Thomason College, Rurki.

Written Statement relating to the Public Works Department.

71,581. *Notes on a scheme for training of recruits in India for the Public Works Department:—*

(1) All recruits for the Imperial service of whatever race or creed should be paid the same and have the same rules for leave, promotion and pension.

(2) A single open competitive examination is not a suitable test for selecting candidates for the Public Works Department. For the Civil Engineering profession many qualifications other than the successful passing of examinations are necessary. Men who pass theoretical examinations with facility may turn out most unsuited for the executive grades where character, initiative power of commanding work, high ideals, &c., are required. The best method, therefore, is to recruit by competition from Colleges where the result is only attained after a course of several years during which practical work is taken as much into consideration as theoretical.

(3) For economy, efficiency, and *esprit de corps*, there should be one Imperial College in India for training. The Thomason College, Rurki, by virtue

of its past history, its buildings, climate and equipment and the fact that in the opinion of a great many responsible judges, it now gives an Engineering education equal to any in England is obviously fitted to be the Imperial College. The other existing Engineering Colleges would undertake the training of the subordinate grades for their Provinces and a special College for the purpose could be built for the United Provinces. These subordinate grades might be termed the Provincial Service, but the successful output of the Imperial College would form the Imperial Service.

(4) Before the formation of the existing Provincial Service confined the Thomason College to statutory natives of India, it was open to everyone and it was the alumni of that period which have produced so many distinguished engineers, a proportion of whom actually came out from England. The present system of appointing Indians to the Imperial Service from England is the worst possible. The choice is limited to the few who can afford to go to England, and these have to undergo the temptations of life in a strange country at an irresponsible age. The climate of India and the conditions of engineering work are often so considerably different to those existing in England, especially in Irrigation and Sanitary work that, though a good sound general engineering education must be the basis, and English experience after training valuable, it is suggested that all recruits both English and Indian should be trained at the Imperial College in India.

(5) Having fixed the proportion of recruitment for the Imperial service from England and in India, an open competitive examination for entrance should be held in England and in India, not necessarily simultaneous but of the same standard. This examination should be a test of general education, chiefly in those subjects necessary for the successful completion of engineering courses. Students in England would be nominated for admission to the entrance examination, and 5 per cent. over and above the number of appointments available would be admitted to the College to allow for wastage.

(6) As regards Indians, the difficulty now arises regarding the various races in India. Some of these are comparatively unfitted for the profession, and perhaps, being proficient in passing examinations would swamp the Entrance examination. Further, most Indians strongly object to serving in distant Provinces. The number of vacancies available in each province yearly should therefore govern the number of men admitted yearly from that province. The question of Railways would have to be settled by the Railway Board. To allow of there being a sufficient number of trained statutory natives for private work, Municipalities, District boards, &c., it is suggested that for each Province 30 per cent. more men should be admitted over and above the number of guaranteed appointments. All Indians competing for the entrance examinations in India would have to obtain nominations, by Boards consisting of the Civil Officer and Indian gentlemen of their districts to ensure they were fit to take up the positions they aspired to. In a great spending department like the Public Works Department this is a very important point.

(7) All students who duly qualified at the end of their course should be given a year's practical apprenticeship on works in India. It is doubtful if the guaranteed appointments should be given on the completion of the College course or at the end of the apprenticeship. The former is the most popular and probably practically the best method while the latter theoretically the best as it permits a man's character, energy and fitness for hard work, &c., to be judged on practical works.

(8) The final climax to the training would be to send all successful candidates to England during their first five years of service for a year's practical training. They would, by that time, have thoroughly grasped the conditions of their Indian work. They would be responsible men with a purpose in life and much less likely to be led away into idleness and dissipation. Further, each man would have specialised into his own line, Irrigation, Railway, Sanitation, Architecture, &c., and could take up his speciality. The training in England would have to be under duly constituted leadership. As the men would go home on Assistant Engineer's pay they would not necessarily be a heavy charge to the State.

LIEUTENANT-COLONEL ATKINSON called and examined.

71,582. (*Chairman.*) The witness said he had occupied his present position for about 12 years. He came out to India in 1887, and had served continuously in the Military Works Department, with the exception of about four years, which he spent on duty in England.

71,583. The engineer class at Rurki was a three years' course, to which 20 students were admitted yearly. There ought therefore to be 60 students, but usually a certain number failed every year, and the average was about 55. The upper subordinate class was a two years' course, to which 40 were admitted yearly, making about 80 students; and the lower subordinate class was a two years' course, to which 60 were admitted yearly. The latter number during the present year had been reduced to 40 yearly, so there would be in the future 80 students in that class instead of 120. This reduction was made because of the opening of an Engineering School at Rasul in the Punjab. All three classes were kept quite distinct within the college, with regard both to their training and to residence. They had also different teachers, in so far as they had each their own staff, but they were superintended by the professors in charge of each Department. The same workshops and laboratories were used.

71,584. The classes were drawn from the domiciled community and from pure Indians. A certain number of students in the upper subordinate class were European soldiers who were being trained for the Military Works Department. With regard to Indians of Asiatic descent, the students were limited to the Provinces of Upper India. Bengal, Madras, and Bombay were excluded. Men from the latter Provinces were only eligible for admission to their own local colleges. The reason for such limitation was, firstly, that each Province had its own college, and, secondly, that if Rurki was thrown open to free competition, it would be very much swamped by certain races who were better at examination work than others.

71,585. With regard to qualifications for entry to the College, under the present regulations, candidates had to possess either the B.A. or the B.Sc. degree, or a school-leaving certificate, with certain optional subjects added. There was very great disparity between the school-leaving certificate and the B.A. and B.Sc. degree. The school-leaving certificate had only been introduced within the last few years, the idea being to carry out the policy of the United Provinces Government which was intended to force men going into an industrial or commercial career to specialise at once instead of going up for the Matriculation and the usual University career. The B.A. and B.Sc. degree had only been left in because the Punjab, for instance, did not have a school-leaving certificate. He would not be in favour of the Bachelor of Science degree being made an essential qualification. He thought the present system was the best.

71,586. The College provided a training in Civil Engineering, Survey, Drawing, Mathematics, Physics, Electrical Engineering, Chemistry, and Mechanical Engineering, which meant the workshops. Each of those subjects might be termed a group. There was also a group which was called the Physique group, in which marks were given for athletic sports and games, and also for moral fitness. The courses practically comprised all the subjects he had just mentioned in various degrees of standard for the three classes, and combined about half as much practical work as theoretical.

71,587. With regard to practical work apart from laboratory work, Survey was done entirely outside the building. The Engineer Class went for three weeks into camp for triangulation purposes. The climax of the Civil Engineer's course in his last year was a Project, which was an independent piece of work, for

which a student was given three months. A Project was set of such dimensions that the student would be able to complete it in the time, and it was of the same nature and standard as an actual piece of work which he would have to do when he joined his profession. That also was dealt with under about five heads—Survey, Drawing, Engineering, Mathematics and Applied Mechanics, and was marked by five independent examiners. The marks were finally all collected so as to form a real practical test for the whole course which the student had gone through during his three years.

71,588. The witness was satisfied that Rurki gave as good a practical training as could be obtained anywhere. There were no improvements which he could suggest which would make the College still more efficient as a training centre for the superior posts in the Works Department. If there were, he would have introduced them. The training was always improving from year to year. He thought at the present time Rurki had as good a staff as could be desired. He had visited some of the colleges in England. On the last occasion when he was in England eight years ago, he made an inspection of all the technical institutions, and wrote a report on them, having in mind a comparison with Rurki.

71,589. He would not care to give a definite answer as to whether the educative value of the Rurki training was as high as that of, say, the Engineering Tripos at Cambridge, because he was not placed in touch with the officers in the Service, and he could only give an opinion from mere hearsay.

71,590. As to his own scheme for training in India, the witness explained that first of all that there would be nomination from Provinces, and then a competitive examination for admission to Rurki. There would not be a competitive examination at the end of the course. The whole three years' course at Rurki was a continual competitive examination. Marking was carried on from year to year, and every man had to qualify at the end of every year, or he had to leave the College. The witness had to remove men in the course of their three years. When he first went to Rurki he found the standard was the same as at the present time, but that every year in the engineering class, six or seven men failed to qualify, were permitted to return, failed to qualify again, and were permitted to return again. Cases had occurred of men who went through their whole course without having once qualified. He protested against such a system, and the whole question was investigated by a Committee, who reported that the standard was not only a very fair one, but was practically the same as was used all over the world in colleges of the same description, and that it ought to be adhered to. Thereupon Government gave orders that in future they would not interfere with the witness's discretion in the matter The result was that instead of having six or seven failures a year, there was now very rarely more than one.

71,591. With regard to recruitment, the witness's idea was that Rurki should be the sole channel of admission to the Imperial Service, and that the Indian colleges should devote their energies to training of the upper and lower subordinates. He suggested along with that proposal that there should be a period of training of one year in England during the first five years of an officer's service. He would not like to say whether as a result of that scheme a sufficient number of good candidates would be obtained from England, but he would regard that as a very important element, mixed up with many difficulties which he had not noted. He thought if men were brought out to India for their training it would be a very great advantage, in so far as they would learn the language, get accustomed to the conditions of the country, and probably get salted to the climate. At the same time it would be a very great responsibility to look after such men, and arrangements would have to be made for medical treatment and probably sanitoria, which would mean a very large amount of trouble and responsibility. In making his proposal the witness was rather looking at the efficacy which he considered would result from having all officers trained together in the country in which they were subsequently going to work. He had had a great admiration for Coopers Hill College and for the spirit which it engendered, and it was, to his mind, the same sort of *esprit de corps* that was required in the Service to get work done in the best way. He thought such a spirit could only be inculcated in a Service like the Public Works Department if all men felt that they were working with brothers who had come from the same place, and that, given one Alma Mater, it should be possible to inculcate the same spirit into one's Indian brothers as it had been undoubtedly inculcated in our own countrymen. He admitted that the result of his scheme would be to sacrifice the opportunities which were now afforded by well equipped colleges and institutions in England for highly trained men to enter the service from that country. He saw very many arguments against his scheme as well as many for it. Probably it would best meet the circumstances to throw the Rurki examination open to the world, though not forcing Europeans to come out. From the point of view of economy, he agreed that the European trained in a college in England at his own expense cost the State less than a European trained in India at the State's expense.

71,592. Asked whether he did not think that *esprit de corps* might to a substantial extent be engendered by the breaking up of the division into Imperial and Provincial branches, the witness said he had always found in the various Departments that there was a great deal of feeling because one man was a Cooper's Hill man, another was a Royal Engineer, another was a Stanley Engineer, and so on. There always seemed to be a certain amount of underlying friction on account of those distinctions, and he thought the same remark would apply in the future with regard to Rurki men and other men. He would not regard that as a sign of healthy rivalry.

71,593. He regarded the year's training in England as of importance. He did not think there would be any difficulty in getting young Indians into suitable institutions or railways in England.

71,594. Speaking from his experience of the students now turned out from Rurki, the witness did not consider he would be justified in suggesting any increase in the proportion of Natives of India in the Service, because he considered that although at Rurki they could be given the best technical education which could be obtained, Rurki was not getting probably the best material to work upon. He had in view an improvement of that material when he made his proposals with regard to entry. The present proportion was 30 per cent. apart from the 10 per cent. in England, and he would be contented with that, until the material which was being received into the College improved and the results were shewn.

71,595. (*Sir Murray Hammick.*) He held the view that all recruits for the Imperial Service of whatever race or creed should be paid the same and have the same rules for leave, promotion and pension, because the fact of two men doing the same work and drawing different rates of pay produced so much friction as to make it worth while to face the extra expense. He did not agree with Mr. Nethersole that Indian feeling would be satisfied if the difference of emoluments were extended in the form of a foreign allowance.

71,596. With regard to his proposal to make Rurki a central college for the whole of India, the witness saw no reason to anticipate any difficulty from differences of language and habits. There was at the College at the present time the same difficulty in a minor degree, in that there were Indian students and European students, who lived separately, and worked and played together.

71,597. The witness did not think his remark in the written statement that "most Indians strongly objected to serving in distant Provinces" would apply to an Indian in the South of Madras being sent to a college in the north of the United Provinces, judging from the number of applications he received from Madras and Bombay to enter Rurki; but he did find that when sending a man to actual employment, he experienced tremendous difficulty in getting an Indian to go to the Central Provinces or to Burma, because the man thought he had to settle in that province for the rest of his life.

71,598. (*Sir Valentine Chirol.*) Out of the 40 upper subordinates who passed out every year, 16 or 17

obtained guaranteed appointments. Such men went out as apprentice overseers for a year on works. They had instructors who were paid by the college, and they had to send in monthly notes of their work; so that they really obtained a good practical training. The remaining 23 all obtained employment somewhere. With regard to the lower subordinate class, the 60 students (now reduced to 40) had no guaranteed appointments to look to, and as a rule it took probably a year to find work for the whole of them. If they did not prefer to wait for permanent Government employment, work of a temporary character could be found for them much sooner. One matter which the witness always complained of was that the sub-overseer, who was a man who required his practical training after his college course even more than his overseer, did not obtain it. It was only the man who went into a Government appointment who received that training. The witness had repeatedly said that every man on passing out from an Indian college should be given a year's practical training by Government. If Government would give such a training, the witness thought the value of those men would be increased, and Government would be repaid a hundredfold. He had not noticed that there had been any increase in the demand from private Indian firms for members of the subordinate classes.

71,599. (*Mr. Abdur Rahim.*) Students who did not want any guaranteed appointments did not come to Rurki; their one aim apparently seemed to be to obtain Government work of some description.

71,600. With regard to his remark that the college was not obtaining the best material, what he had more definitely in mind was that for positions in a big Department such as the Engineering service, men were wanted of a certain mental distinction. He was of the opinion that at the present time there were too many men who were the sons of Public Works Department subordinates, apothecaries and so on. It would be better to have a system of nomination by Indian gentlemen, to ensure that the men coming in were from the right class.

71,601. The difference between a man who had taken his degree of Bachelor of Science, and a man who came only with a school leaving certificate, was purely in the subjects of Physics and Chemistry, and to a certain extent in Higher Mathematics. He could not at the moment make any comparison between such men.

71,602. The witness's desire was to have students of a higher social status than the present class. He could give no reason why students of the former class were not at present attracted to Rurki. He was of the opinion, both from the point of view of efficiency and economy, that his scheme for a central college was a better one than a proposal which provided for the development of local colleges.

71,603. The present demands from students in Bengal and Madras and other parts of India for admission to Rurki could be met by strengthening the staff, and there would be no objection to their admission, provided that the number of students from each Province was definitely fixed.

71,604. (*Mr. Madge.*) Rurki possessed most excellent educational workshops. The authorities had, as regards mechanical engineering, an exceedingly difficult problem to face. The college turned out a class known as the mechanical apprentice class, which was recruited from what the witness might term educationally a very low grade man. That class was doing very well. Then there was a class called the technical class, which was supposed to be composed of higher grade men. On the recommendation of the Naini Tal Conference that class was abolished, and a still higher class was started for the relatives of capitalists and manufacturers with the idea of turning out men who might ultimately manage businesses and factories. That went on for four years, but nobody entered it. The conditions were then made easier, and at the present time, in what was called the higher division of the Department of Technology, there were about three men, very far from the class of men Government aimed at, because that class of men would not go in for industrial or mechanical engineering.

71,605. The witness had had domiciled Europeans and Anglo-Indians under him, and both classes had turned out excellent men, and each had had its failures. The good men had been as efficient as the good Indians. He had had some practical experience of the domiciled Anglo-Indian and the man imported from home, and he should say the imported man was far the better of the two.

71,606. (*Mr. Macdonald.*) Rurki was not maintained at all from Imperial funds; ever since the witness had known it, it had been entirely supported by Provincial funds. In that respect it was on the same footing as the other engineering colleges of India.

71,607. The marking for moral fitness was done in a negative way, in so far as there were no punishments at Rurki, except expulsion. A man who generally had been slack, unpunctual, and who had been misbehaving himself, would find at the end of his career that he had been fined a very considerable number of marks, which appreciably affected his position on the list.

71,608. Privately managed railways did not utilise Rurki to any extent for the supply of engineers and mechanics. Two apprentice overseers and one apprentice engineer were sent every year to railways and the railways assisted very much in the training of the mechanical apprentice class. He had entered into a lengthly correspondence regarding the training of permanent-way inspectors, but nothing had come of it. He had never differentiated much between privately managed and State managed railways.

71,609. (*Mr. Fisher.*) The witness thought the standard at Rurki was as good as that at Woolwich in certain subjects.

71,610. Comparing the mechanical laboratory of the University of Sheffield with that at Rurki, the witness said as far as he could judge from glancing through the copy of the Sheffield calendar on the table everything which was at Sheffield was at Rurki, except the Parson's steam Turbine. In the Electrical Department, he should say Rurki had a good deal more equipment than Sheffield. There was a steel testing laboratory at Rurki. With regard to the metallurgical appliances, there was practically the same equipment at Rurki as at Sheffield. He assumed that all students coming to Rurki would have passed an elementary examination similar to that insisted on at Sheffield.

71,611. Of the Indian students a very large proportion, and of the Anglo-Indians, a very small proportion were capable of undertaking Higher Mathematics.

71,612. (*Mr. Sly.*) The witness could not say on what basis the distribution of appointments was made between the different colleges in India.

71,613. He was conversant with the difficulty, that the present rules for admission to Rurki to a certain extent debarred graduates from entering the course owing to the limits of age; and he was shortly going to bring the matter before the Committee of Management. It would be considered whether it would not be well to raise the minimum age from 17 to 18, and the maximum from 21 to 22.

71,614. The average number of students who came up for the examination in the Civil Engineering class was 60, of whom 20 were admitted. No distinction was made between the different communities in India. The first 20 on the list, no matter of whatever race, passed into the college. The proportion of the domiciled community in the Civil Engineering class was 12 out of 60; and among the Indian students 95 per cent. were Hindus and 5 per cent. were Muhammadans.

71,615. The marks of the students were carried on from year to year, and it was not the case that there was a final competitive examination which alone determined the places of the students obtaining the appointments.

71,616. A medical test was enforced for admission into the college. Marks were given in the final examination for sports and games. Not only had a man to submit a medical certificate signed by a

commissioned officer on entrance, but he was marked for games, gymnastics, athletics, sports and volunteering, and also for physical fitness. Before he left the college he underwent another examination by the Civil Surgeon, who gave him a certificate that he was fit for the Public Service. Such marks affected the position of the candidate in the final list.

71,617. The system of appointing two apprentices for one Government appointment was introduced about 14 years ago. He had not made up his mind whether it was a suitable system or not. Theoretically it was the best system, because in his apprenticeship a man's character and ability to push on work and take responsibility could be tested. On the other hand, it seemed very hard that a man who had worked well at college and passed out top, should perhaps eventually lose his guaranteed appointment to a man who had passed out sixth. On the whole, he would be in favour of abolishing the system.

71,618. With regard to the witness's scheme for recruitment to the Imperial Service, he would have a certain number of appointments allocated to England, to which he would add 5 per cent., and a certain number of appointments allocated to India, to which he would add 30 per cent. All candidates would go through a three years' course of training at Rurki. Both sets of students would work together, as Indian and European students did at the present moment. He did not think his scheme in practice would result in inferior men out of one section obtaining appointments in preference to superior men out of another, because that would be fixed beforehand. If actual examination results did not tally with the approved distribution of appointments as between Indians and Europeans, he would give up the method of publishing marks and would pass students out in classes. The authorities of the college were very anxious to give up publishing marks.

71,619. (*Mr. Chaubal.*) He did not consider the Madras, Bombay and Sibpur Colleges, were quite as well equipped as Rurki, although they could be equally well equipped if Government chose. There was not at present the same restriction for admission into the colleges of other Provinces as there was at Rurki. So far as Madras and Bombay were concerned, it was true that only one appointment in the Imperial Service was given to each of those colleges. He agreed that supposing the Rurki standard of training was introduced into the other colleges, there might be amongst the first five or ten men who entered for the examination a few who were as good as, or better than, the five or six whom Rurki sent into the Imperial Service every year. The reason that Madras and Bombay were given only one place was because the natural characteristics of those races were not particularly adapted for the Civil Engineering profession.

71,620. (*Sir Theodore Morison.*) He thought the fee at Rurki for the Engineering class was Rs. 20 a month. The college issued a memorandum of expenses, and it could be taken that the cost for a European was Rs. 120 a month, and for an Indian about Rs. 70. The cost of living had risen in India, and the students had told him they had great difficulty in keeping within those limits, and that probably it would mean another Rs. 10 or Rs. 15 at the present time.

71,621. There were no means by which students who did not obtain Government appointments could get apprenticed or pupilled at other works. The same was true with regard to the upper subordinate officer. The only reason against such a system of apprenticeship was expense. It would cost the Government a good deal to pay such people an allowance during their apprenticeship. It would be absurd to suppose that such men would pay the Government for an apprenticeship. They would not think of doing so for a moment. He did not propose to give men who had been selected in England but trained at Rurki any allowance during the time they were at Rurki. If such a system was put into force, it would mean giving everything free to everybody.

71,622. The only college which he inspected when he was in England eight years ago was Cambridge; he did not go to Glasgow.

71,623. (*Lord Ronaldshay.*) It was true that according to the memorandum of expenses published by the authorities of the college, it cost a European two-thirds more than it cost a native to get his training at Rurki. He could not say whether that represented the relative cost of living generally throughout India, but the probability was that it reflected general conditions.

71,624. The reason why he suggested that an Indian student should have a year's practical training in Europe was because he thought it would do the man an enormous amount of good to see the way work was done in England, and that he would be able to get some use out of it, probably more after he had seen work in India for two or three years. He strongly took the view that an Indian would benefit very much more by visiting Europe after serving some years in his own country than he would if he went to Europe merely as a student.

(The witness withdrew.)

Captain H. deL. POLLARD-LOWSLEY, C.I.E., R.E., Under-Secretary to the Chief Commissioner, Central Provinces, in the Public Works Department.

71,625. **(I.) Methods of Recruitment.**—The number of Royal Engineer officers permitted to be employed in the Public Works Department (excluding Railways) as sanctioned for five years, from the 1st April, 1905, is thirty and this number is at present employed in the Department. These officers leave the School of Military Engineering, Chatham, after 2 years' service and generally join the Department shortly after arrival in India. They therefore usually join the Department between the age of 21 and 22 and about 2½ years after first commission. Occasionally officers with more, and in some cases considerably more, than 2½ years' service are transferred to the Public Works Department. In paragraph 2 of Public Works Department Resolution No. 154-73-E., dated the 11th February, 1910, it is stated that for purposes of calculating the pay to which an officer is entitled, the first year of service will be reckoned to commence 2½ years from date of first commission, and the manner in which the pay of an officer, whose position on first appointment was especially fixed, shall be calculated is laid down. In paragraph 2 of Public Works Department Resolution No. 6882-E., dated the 18th January, 1911, it is stated that the manner in which the rate of pay admissible to a Royal Engineer officer who entered the Department after the 11th February, 1910, shall be the same as in the Resolution dated the 11th February, 1910. In neither of these Resolutions is the question of the *seniority* of officers of the Royal Engineers entering the Department considered, nor is any reference made to Public Works Department Code, Volume I, paragraph 143, under which an officer entering the Department before he has completed 2½ years' service counts his service from the date on which he enters the Department. It is also laid down in that paragraph (143) that no officer shall add more than one year to his actual service in the Department, but presumably this ruling is cancelled by paragraph 2 of the Resolution dated the 11th February, 1910.

Proposals.—(i) Officers entering the Department before they have completed 2½ years' service shall reckon their service from the date of appointment to the Department both for seniority and pay. In the case of officers who are appointed direct to the Department the date of appointment should be the date of landing in India.

(ii) Officers entering the Department after the completion of 2½ years' service and before completing 7 years' service shall reckon their service in the Department to commence two and a half years from the date of first commission both for seniority and pay.

(iii) Officers entering the Department after having completed 7 years' service or more shall reckon their

service in the Department to commence 2½ years from the date of first commission for pay and 3½ years from the date of first commission for seniority. In the case of officers who are transferred from the Military Works Service to the Public Works Department Service service in the Military Works Service shall count as service in the Public Works Department in fixing their seniority.

The above rules when they are to the advantage of officers already in the Department should have effect from the date of their introduction, but in the case of officers who may be adversely affected by them they should not be applied. In the case of officers whose promotion has been retarded in the past the rule contained in paragraph 2 of the Resolution dated the 11th February, 1910, may continue to apply.

71,626. **(II.) System of Training and Probation.**—The present system of training at the Royal Military Academy, Woolwich, and the School of Military Engineering, Chatham, produces officers who are in every way capable of undertaking the duties of an officer in the Public Works Department. No period of probation is ordinarily necessary for Royal Engineer officers appointed to the Department and no such period of probation is laid down except in the case of an officer whom it is considered desirable to appoint to a grade higher than that of an Assistant Engineer, 1st grade (*vide* Public Works Department Code, Volume I, paragraph 144). In such cases (*vide* paragraph 145) a period of probation of six months is laid down. It would appear that the conditions of service and pay laid down in paragraph 145 should have been modified in accordance with the Resolution dated the 11th February, 1910, and the 18th January, 1911. It should be possible for the Government of India to decide from a consideration of an officer's previous records of service and reports whether he is likely to be fit for appointment to the Department or not. If, however, this period of probation is considered to be necessary, an officer should, during this period, draw the rate of pay he would be entitled to if appointed permanently to the Department and should not be placed on the pay of an Assistant Engineer.

71,627. **(III.) Conditions of Service.**—Now that officers of the Royal Engineers may no longer elect for continuous service* in India, they are liable to compulsory retirement for age under the British Service Regulations. Thus if an officer has not reached the rank of Lieut.-Colonel by the age of 50, he is required to retire from the Army and to vacate his Civil appointment under A.R.I., paragraph 1002. The rules enforcing retirement from the Army require no alteration, but retirement on account of age—under 55—should not entail the vacation of an appointment in the Public Works Department and an officer's pay and pension in the Department should not be affected by his compulsory retirement from the Army. It is true that an officer so retired may be re-appointed by the Government of India, but should there be a block in the Department such re-appointments might not be made and officers of the Royal Engineers are thus placed at a disadvantage.

The existing rates of travelling allowance particularly in the case of transfer are inadequate. There is no doubt that transfers in the interests of the Public Service must involve some expense to the officers transferred, and it is practically impossible to frame rules suitable to all cases. It is, however, suggested that the present rules should be revised and that travelling allowances should be fixed on a more liberal scale and that special rules should be framed to cover transfers.

71,628. **(IV.) Conditions of Salary.**—(1) Royal Engineers on joining the Public Works Department prior to 1906 were given the option of two scales of pay intended to be approximately equal:—

(*a*) Regimental pay *plus* staff pay according to their position in the Department.

(*b*) Consolidated pay depending only on departmental rank *plus* net military pay.

The two scales differed but slightly. Generally speaking there was practically no difference in the Assistant and Executive grades, if anything (*b*) was the better, and (*a*) was the better in the Administrative grades.

(2) Public Works Department Resolution No. 170, published in the *Gazette of India* of the 26th August, 1905, deals with the question of the improvement in the pay of Administrative Officers of the Public Works Department, and in the preamble it is recognized that the pay of Superintending Engineers, 2nd and 3rd Class, then current, was insufficient. The reasons given for the necessity for an immediate increase were (i) to maintain the highest standard of efficiency, and (ii) to retain in the service for the full term of their career officers of the highest professional attainments and ripe experience.

In Standing Order No. 228 of the Public Works Department Code, Volume I, 8th Edition of 1907, the new Civil scale was detailed and with it the scale for Royal Engineer officers on the staff scale pay. To the Standing Order were added certain notes detailing the rules laid down for Royal Engineer officers on the staff scale of pay and the conditions with which they must comply on reaching Administrative rank. From this it will be seen that such officers can only elect the improved Civil scale of pay, while from Standing Order No. 242, dated the 29th August, 1907, it will be seen that Royal Engineer officers on the old consolidated (new Civil) scale draw their Military pay proper in addition, independent of the maximum of the Department. The result of this is that of Royal Engineer officers in the Administrative ranks those on the staff scale who have drawn about the same or somewhat less pay in the Assistant and Executive grades are again, under these orders, much worse off in the Administrative ranks than those who elected the consolidated scale of pay. The difference is considerable, being Rs. 182 in the case of a Major and Rs. 304 in the case of a Lieutenant-Colonel or Colonel. By the publication of a single despatch the parity of the two scales has been entirely destroyed, and yet officers who were adversely affected are allowed no further choice in view of the entirely novel set of conditions thus introduced.

(3) Under Public Works Department Notification No. 675-694-E., dated the 24th April, 1908, an incremental scale of pay was introduced for Civil Engineers in the Public Works Department who had not yet reached the Administrative grades, as it was recognised that in the altered circumstances of the country the existing rates of pay are insufficient to ensure the recruitment of Engineers with the requisite qualifications either in England or in India, or to maintain the standard of efficiency which is requisite to the proper maintenance and control of the great system of public works on which the advance to prosperity of the country so largely depends. The result of the introduction of the new scale of pay was to increase the pay of Civil Engineers by about 16 per cent. and raise the pay of the Civil Engineers nearly to that of the Royal Engineers in the Department, *vide* columns 4 and 9 of Statement I. The pay of the Royal Engineers remained unaltered. *This in the case of Royal Engineer officers on the consolidated Civil scale of pay* plus *net Military pay was contrary to the scale laid down in Public Works Department Code, Volume I of 1907, paragraph 10, where it is stated that "The consolidated scale of pay for Royal Engineers is the Civil scale for the time being."* A further result was that Royal Engineer Assistant Engineers had to serve 11 years before promotion to Executive Engineer against 8 years in the case of a Civilian. It was evidently recognised that the above orders involved an injustice to Royal Engineer officers, as the orders were modified with back effect by Public Works Department Notification No. 154-73-E., dated the 11th February, 1910, which introduced an incremental scale of pay for Royal Engineer officers in the Public Works Department. The scale of pay gives Royal Engineer officers an average of rather less than Rs. 80 per mensem more than Civil Engineers of the same standing, *vide* columns 4 and 10 of Statement I*. The increase of pay in the case of officers of the Royal Engineers was, however, only about 7 per cent. in the case of officers of the Royal Engineers as compared with 15 per cent. in the case of Civil Engineers. Prior to the introduction of this new scale the pay of the Royal Engineer officer was about 19 per cent. more than that of the Civil Engineer. After the alteration the Royal Engineer scale was only about 9 per cent. in excess of the Civil scale.

* *Vide Gazette of India*, dated the 2nd January, 1904.

* *Vide* page 60.

The Government of India, however, again changed their attitude and in Public Works Department Notification No. 63–82–E., dated the 18th January 1911, introduced a new incremental scale of pay for Royal Engineer officers who entered the Department after the 11th February 1910. This new scale of pay was the same as that laid down for Civil Engineers in Public Works Department Notification No. 675-694-E., dated the 24th April 1908. The result of this was that Royal Engineer officers entering the Department after the 11th February 1910, will draw about 2 per cent. less pay than that laid down in paragraph 10 of Public Works Department Code, Volume I (1907), and about 9 per cent. less than Royal Engineer officers who entered the Department prior to the 11th February 1910, and this in face of the reasons already quoted for issuing the Notification dated the 24th April 1908. Further, the arbitrary fixing of the above dated (11th February 1910) has resulted in Royal Engineer officers drawing less pay than brother officers junior to them in the Corps who happened to join the Department before the 11th February 1910.

(4) In thus equalising the scales of pay of Royal Engineer officers and Civil Engineers, the Government of India appear to have overlooked the grounds on which Royal Engineer officers have hitherto been considered as entitled to the net Military pay in addition to the Civil scale of the grade for the time being. These are as follows:—

(1) Royal Engineer officers are liable to be detached for active service in time of war, and while in active service are exposed to war risks to which the Civil Engineer is not exposed unless he volunteers for active service.

(2) They are liable in the interests of the Public Service to be transferred to Military Service at any time.

(3) They have greater liabilities and expenses to meet than Civil Engineers, such as (*a*) Upkeep of uniform; (*b*) Contribution to Mess and Band Funds; (*c*) Enhanced rates for insurance. (In addition to this they are not allowed even to contribute to the General Provident Fund as Civil Engineers do.)

(4) They have to pass Military as well as Civil examinations for promotion—the former up to the rank of Lieut.-Colonel.

(5) Civil Engineers belonging to the Royal Engineer Special Reserve who take up an appointment in the Public Works Department are given (*a*) in the first instance £40 to obtain their uniform though they only require service kit and no full dress, and (*b*) a higher rate of pay than the regular Royal Engineer officers of the same rank while performing Military duty in England.

It is submitted that in no other Department in recent years has there been a reduction in the scale of pay. On the contrary it has generally been recognised that the increased cost of living has justified an increase in the scales of pay, yet in the face of this almost general increase the result of the Government of India Notification dated the 10th January 1911 has been actually to reduce the pay of Royal Engineer officers employed in the Public Works Department by approximately 9 per cent. below that of those who joined prior to the 11th February 1910 and 2 per cent. below that in force prior to 1907.

(5) Taking into consideration the fact that the Royal Engineer officer has liabilities which the Civil Engineer has not, it is proposed that the scale of pay of all Royal Engineer officers in the Public Works Department in the Administrative, Executive and Assistant grades should be fixed with back effect from the 8th March 1908, on the basis laid down in Public Works Department Code, Volume I (1907), paragraph 10, *i.e.*, consolidated pay equal to the scale of pay for Civil Engineers of the same standing *plus* the net Military pay of rank subject to no limitation. If this be done the pay of the Royal Engineer officers in the Executive and Assistant grades will be about 15 per cent. prior to the introduction of the revised scales, while in the administrative ranks the difference and rates of pay will be exactly the same as were permissible for officers who had elected the consolidated scale of pay prior to the issue of Standing Order No. 228 of the Public Works Department Code, Volume I (1907), referred to in paragraph 2 above.

(6) Under paragraph 4 of Public Works Department Resolution No. 154–73–E., dated the 11th February 1910, the pay of an officer of Royal Engineers may not exceed Rs. 900 a month unless he holds a Divisional charge or a charge which, in the opinion of the Local Government or Administration, is of equal importance. Under Public Works Department Resolution No. 63–82–E., dated the 18th January 1911, the limit for officers entering the Department after the 11th February 1910 is Rs. 800. This ruling should not apply in the case of an officer who is reported on as fit to hold the charge of a Division but for whom no Divisional charge is available.

(7) The present division of the rank of Chief Engineer into two classes and the variation of local allowance as Secretary to a Local Government gives rise to the anomaly that the Chief Engineer may be drawing less emoluments than a Chief Engineer junior to him in service in another Province although the work and responsibilities of such posts are exactly similar. It is suggested that there should be only one class of Chief Engineer and that the salary attached to the appointment should be Rs. 3,000 irrespective of whether a Secretaryship to a Local Government goes with the appointment or not. The local allowance of Rs. 250 or 150 might in this event be withdrawn.

(8) It is suggested that the duties and responsibilities attaching to the post of Secretary to the Government of India in the Public Works Department, which appointment is invariably held by an officer specially selected from among Chief Engineers and usually of much longer service than any other Secretary to the Government of India, warrant the appointment being paid at the same rate as Secretaries in the Home, Finance and Commerce and Industry Departments, *viz.*, Rs. 4,000 per mensem.

71,629. **(V.) Conditions of Leave.**—*Privilege leave.*—Under existing rules, which limit the period of privilege leave which may be taken at one time to three months, it is not infrequently impossible for an officer to avail himself of all the privilege leave which he has earned. This rule operates hardly on the officer who cannot easily be spared, or who is keen to complete the work on which he is employed. It is suggested that the rules should be framed so as to permit an officer, who, for good reasons, is unable to take privilege leave due to him within 33 months, to accumulate such leave up to a maximum of 6 months. The rule which requires an officer taking privilege leave immediately before retirement to return to duty before he retires should be abolished.

Furlough.—The rule prohibiting an officer from taking furlough till an interval of not less than 18 months has elapsed since his return from privilege leave of over six weeks' duration should be abolished. This rule sometimes prevents an officer from taking privilege leave which it may be desirable he should take in the interests of his health.

Under present conditions it is not always possible for an officer to avail himself of all the furlough which he has earned. It would be to the advantage of officers if they were permitted to commute part of their furlough on half pay into half the period on full pay. A limit might be laid down—say, the commutation of 2 years' furlough on half pay into one year on full pay. In order to prevent this concession from acting hardly in the case of an officer who, owing to his having commuted his furlough early in his service, has no furlough available towards the end of his service, when he may require it, it should be provided that an officer may recommute furlough previously taken on full pay into furlough on half pay on making good the extra furlough allowances received by him when the furlough on full pay was taken.

Study leave.—It is understood that a proposal has been made to abolish the Chatham course. If this is done the rules for the grant of study leave to officers of Scientific and Technical Departments should be made applicable to Royal Engineer officers and indeed all officers in the Public Works Department. It is, however, urged that it is most undesirable that this course be abolished. Royal Engineer officers serving in the Public Works Department are

almost entirely out of touch with the Corps, and this course gives them an opportunity to meet many of their brother officers at Chatham, and to bring up to date their knowledge of professional subjects on which they may not have been employed in India.

71,630. **(VI.) Conditions of Pension.**—(1) The maximum pension which can be earned by an officer of the Royal Engineers in the Public Works Department is £700 per annum after 32 years' service from date of first commission. This compares most unfavourably with the pensions admissible to officers of the Indian Medical Service who can earn the following higher pensions:—

	Rs.	
Colonel of the Indian Medical Service after 30 years' service, of which 3 years' active service is in the rank of Colonel	825	Army Regulations, India, Volume I, paras. 726 and 728
Colonel of the Indian Medical Service after 30 years' service, of which 5 years' active service is in the rank of Colonel	950	
Surgeon-General of the Indian Medical Service after 30 years' service, of which 3 years' active service is in the rank of Surgeon-General	1,050	

(2) Civil Engineers who joined the Public Works Department not later than 1898 can qualify for extra pensions as follows:—

Rs. 1,000 (£87–10) per annum for 3 years' service as Superintending Engineer

Rs. 1,000 (£87–10) per annum for 3 years' service as Chief Engineer.

The above extra pensions have been modified in Article 643 for officers entering the Department after 1898, and, in the case of such officers only one extra pension may be drawn. No such extra pensions are permissible for officers of the Royal Engineers.

(3) The pension of an officer of the Royal Engineers who enters the Department after the 31st December, 1904 and who completes not less than 20 years' Indian service for pension is that admissible under the Royal Warrant *plus* such portion of the difference between the retired pay of the Royal Engineers generally and the Indian Army pension belonging to his total length of service as is represented by the proportion his Indian pension service bears to the minimum total service that would have qualified him for the beforementioned Indian Army pension.

(4) An officer who comes to India immediately after leaving the School of Military Engineering, Chatham, can earn his full pension of £700 a year, provided he serves continuously in India at the age of 51 or 52, after completing 32 years' service from the date of first commission. At this time an officer would ordinarily be a Chief Engineer unless he is considered unfit for advancement to that rank, but though he he may serve for a further period of three years and, say, hold the appointment of Secretary to the Government of India or Inspector-General of Irrigation he is entitled to no extra pension on this account. It is considered that an officer of the Royal Engineers, who is promoted to the rank of Chief Engineer, should receive an additional pension of £40 per annum, for each year's service as Chief Engineer up to 3 years, and that a further addition of £40 per annum should be made to the pension of an officer for each year's effective service as Secretary to the Government of India in the Public Works Department or Inspector-General of Irrigation up to three years. An officer who obtains a pension as Secretary to the Government of India or Inspector-General of Irrigation would of course draw the full pension of a Chief Engineer of three years' service in addition to the pension as Secretary or Inspector-General of Irrigation. Under these proposals the ordinary pension of an officer of the Royal Engineers in the Public Works Department will remain at £700 per annum and the maximum wil be £940 per annum, which is less than that of a Colonel of the Indian Medical Service, who has done 30 years' service, of which 5 years has been in the rank of Colonel.

71,631. **(IX.) Other points within the terms of reference to the Royal Commission not covered by the preceding heads.**—There appears to be no good reason why officers of the Royal Engineers should be excluded from the benefits of the General Provident Fund. It is suggested that this should be open to them to subscribe to it.

I.—*Statement showing comparison of different scales of pay of Imperial Civil Engineers and Royal Engineer Officers as revised from time to time.*

Column 4 exceeds Column 3 by 16 per cent.

(a) Officers already in service on the 15th May, 1912, are entitled to Executive rank in their ninth year of service, but future entrants will obtain this rank in the 11th year of service, *vide* paragraph 2 of Government of India Resolution No. 439–458–E., dated the 15th May, 1912.

[*Continued.*

Captain POLLARD-LOWSLEY called and examined.

71,632. (*Chairman.*) The witness said he joined the Department when he was 22 years of age, and had been 14 years in the service. There were 30 officers of the Royal Engineers in the Department, and the views expressed in the written statement were those of his colleagues. Royal Engineer officers in the Public Works Department and the Railway Department considered that instead of being allowed the ordinary civil rates of pay, they should receive the ordinary civil rates of pay *plus* the net military pay of their rank.

71,633. The past history in regard to pay given to Royal Engineers in the Department was somewhat complicated. Before 1906 a Royal Engineer officer could choose between one of two classes of pay: (1) civil rates *plus* net military pay, and (2) regimental pay *plus* staff pay. The effect of the 1907 rules was to abolish (1) for all officers entering the Department after 15th October 1906; to increase the emoluments of Royal Engineer officers already in the Department, and drawing pay under (1) on reaching the administrative ranks, in that such officers were allowed to draw the new civil rates of pay *plus* net military pay; and to give officers already in the department and drawing pay under (2) the option of continuing on that scale in the administrative ranks or drawing the improved civil rates of pay in those ranks *without* net military pay.

71,634. In 1908 the rates of pay of Civil Engineers in the Executive and Assistant grades were increased. The increase was 16 per. cent. and raised the pay of Civil Engineers in these ranks to very nearly the same as that of Royal Engineer officers already in the Department, who continued to draw pay as follows:—

(i) *Consolidated.*—The *previous* Civil rates of pay *plus* net military pay.

(ii) *Staff.*—Staff pay *plus* military pay and allowance of rank.

71,635. In 1910 a new scale was introduced for Royal Engineer officers already in the Department to take effect from 8th March 1908. This scale gave Royal Engineer officers pay in the Executive and Assistant grades in excess of that drawn by Civil officers by about 9 per cent. Under this scale no military pay could be drawn by Royal Engineer officers.

71,636. In 1911 the Government of India decided that in the case of new entrants only civil pay should be allowed, and no military pay.

71,637. Asked how far the 9 per cent. referred to corresponded to the amount of net military pay, the witness explained that net military pay varied with rank. A subaltern's net military pay was Rs. 70, and the average pay of an Assistant Engineer in the Civil Department under the 1910 rules was about Rs. 500, so that the percentage would be about 14; that was to say, civil pay *plus* net military pay would have given an additional 14 per cent. instead of the additional 9 per cent. which subalterns obtained under the 1910 Resolution. A Captain's net military pay was Rs. 140, and an Executive Engineer drew on an average about Rs. 1,000, and here the result was the same as it was in the case of the subaltern. The percentage was difficult to ascertain in the case of a Major. A Major was paid Rs. 180 net military pay, and probably he would be a Superintending Engineer drawing Rs. 1,500 to Rs. 1,750. Taking an average of Rs. 1,600, the percentage would still be the same—about 14.

71,638. The witness based his complaint on the following grounds; it was laid down that the consolidated scale of pay for Royal Engineers should be the civil scale for the time being. Under that ruling, Royal Engineer officers should get the ordinary scale of pay of the Civil Engineers *plus* net military pay. Actually their pay had been reduced below that. That was to say they were not getting what was laid down as their correct scale of pay prior to 1906. The order seemed to have become a dead-letter. His complaint referred both to officers who had entered prior to 1910 and to officers who had entered since, but he agreed that those who had entered in the last two or three years had entered under definite conditions. He could not say whether there had been any falling off of recruits to the Department of late years.

71,639. The witness suggested that Royal Engineer officers should receive higher pay than Civil officers in the Public Works Department, because Royal Engineer officers had certain additional expenses, and were also liable for military service. He thought such reasons would justify Government in paying more than the civil rate. There were a good many Civil Engineers now in the special war reserve, but they were not getting any additional concessions over their colleagues.

71,640. The witness admitted, with regard to his argument for higher pay, that the whole conditions of service would have to be taken into consideration in order to arrive at a fair estimation. The conditions of pension of the Royal Engineers were considerably better than those of Civil Engineers. The Royal Engineer got a pension of £700 a year and provision was also made for his widow and children. There was no such provision for the family of the Civil Engineer. The witness did not admit, however, that that was a factor which should be taken into consideration. Royal Engineers came under the same pension rules as the Indian Army. Although they came out to India under military conditions, they actually served in civil employ. It was only in abnormal circumstances that Royal Engineers would revert to military employ.

71,641. The witness could not at the moment produce figures to shew how the civil rates of the Public Works Department compared with the pay a Royal Engineer officer would receive in his regiment, but he would send them to the Commission.*

71,642. It was true that Royal Engineers were allowed to reckon their first year of service in the Department as commencing 2½ years from the date of first commission, but that did not give them any advantage. Taking the top 15 Majors, and the top 15 Captains in the Sappers, their average age, 2½ years after commission, was 21 years and 10 months; that was to say, if they were joining the Public Works Department, they would count their service from the age of 21 years and 10 months. Taking the 30 Coopers Hill men employed in the United Provinces, it would be found that their average age on joining was 21 years and 11 months. The rule had been interpreted as meaning that an officer of the Royal Engineers who joined the Public Works Department before he had completed 2½ years' service did not count his service from the time he joined. Although he was in the Department, an officer was not allowed to count his service until he had completed his 2½ years' service from date of first commission, the witness did not think the rule was originally intended to mean that.

71,643. He could not say what was the average age at which a Royal Engineer officer joined the Department. A man generally joined before he had finished three to four years' actual service, but there were men who came in later. It was impossible to estimate the age of those men. There were not many cases of Royal Engineer officers entering the service at ages between 25 and 33. The witness desired to point out that any officer who came in late not only superseded Public Works Department officers, but Royal Engineer officers who were in the same Province. He himself had been superseded by three, but he had not considered it a matter for complaint. The men were wanted to bring up the establishment to the cadre, and had to be brought in, and they could not be obtained from anywhere else. He had suggested in his written statement that men who came in when they had had more than seven years' service should lose one year for seniority, at the same time receiving the pay which they would have got if they had joined 2½ years from the date of commission.

71,644. It might be inconvenient to Government to impose an age limit for the recruitment of Royal Engineer officers to the Public Works Department because Government might desire to bring certain

* *Vide* paragraph 71,662.

men in, especially as the Public Works Department was so very shorthanded. If the rule which he had just suggested was adopted, he did not think it would be necessary to fix an age limit, because it might deter officers of the Military Works Service, or other Branches of the Royal Engineers, from entering the Public Works Department late in life.

71,645. The witness could not possibly agree with the suggestion that Royal Engineers coming into the Public Works Department should be placed at the bottom of the list.

71,646. (*Lord Ronaldshay.*) It was the practice for a Royal Engineer to count his first year of service in the Department as commencing 2½ years after his commission, or from the date of his entering the Department, whichever was earliest, but the latest rules had gone entirely against that; he meant that paragraph 143 of Volume I of the Public Works Department still stood, but it was not observed.

71,647. The witness did suggest that in the case of an officer entering the Department after seven years' service, his first year of service should count from 3½ years after his commission, instead of 2½. The witness had no reason for suggesting the figure of 3½ years, except that he wanted to lay down something which might deter officers entering late in their service. He had taken the figure of seven years in order to give an officer a reasonable chance of putting in some service in England, and then coming out to India to join the Department if he so desired to do so.

71,648. The witness could find no rules regulating seniority. Apparently, although an officer counted his first year for pay as commencing 2½ years after commission in the Army, he did not necessarily count his seniority from the same point.

71,649. A Royal Engineer would have to retire from the Army, if he was not a Lieutenant-Colonel, by the age of 50. A Royal Engineer when he retired from the Army also had to retire from the Public Works Department, unless the Government of India re-appointed him, and the particular request which the witness and his colleagues made was that retirement from the Army under Army Regulations should not necessarily compel an officer to retire from the Public Works Department. In other words, so far as service in the Public Works Department was concerned, he should be under the civil rules for retirement.

71,650. He believed that the contributions made by Royal Engineer officers to mess and band funds were obligatory.

71,651. The Chatham course referred to in the written statement was generally known as a refreshing course. Officers went to Chatham for six months, passed through various courses in various subjects and got more or less in touch with the corps. A man had to complete 10 years' Indian Service before he could take such a course. The witness would be very sorry to see it abolished.

71,652. When serving in the Public Works Department, Royal Engineers came under the civil leave rules.

71,653. (*Sir Theodore Morison.*) The witness was not absolutely sure whether a sapper who was in the Civil Engineering branch, could revert to military employment. He could revert to duty in England, so the witness took it that he could revert to military employ in India.

71,654. There was not so much discontent with the 1910 rate of pay as there was with the 1911 rate of pay. He thought future entrants would enter the Survey Department in preference to any other.

71,655. (*Mr. Sly.*) The reason why the witness suggested that Military Works service should count as service in the Public Works Department, was because the Military Works and Public Works Departments were doing the same kind of work. He thought a man who had been serving all his time in Military Works should be entirely fitted for the Public Works, and he did not see any reason why such a man should lose anything as compared to the civil officer.

71,656. It was very difficult to assess at a definite figure the actual expense of a Royal Engineer as compared with those of a Civil Engineer, but he thought £40 a year would cover all the items. A Royal Engineer did not reap any advantages from the special payments he had to make; he did not have a chance of wearing his uniform, and hardly ever saw the Chatham mess. Royal Engineers in civil employ would not welcome a suggestion that such payments should be abolished; they still took much interest in the corps.

71,657. With regard to the suggestion that the witness's scheme for pensions of the Royal Engineers would involve a consideration of the pensions of the whole of the Indian Army, the witness pointed out that the Indian Army had the same scale of pay as the Department. The officers of the Army rose to Rs. 700, and considerably higher if they became Generals or Lieutenant-Generals; whereas the Royal Engineers had no such prospects and had to stop at the Rs. 700 grade, and also retire at 55.

71,658. The witness thought the privilege of being allowed to subscribe to the General Provident Fund could be extended to Royal Engineers in civil employ without it being given to Royal Engineers in other employ.

71,659. (*Mr. Macdonald.*) The reason why Royal Engineers were in the Public Works Department was because a certain reserve of Royal Engineer officers had to be kept up in India, and there was not enough work in the Military Works Department to employ all the sappers required to be kept in India. The witness did not think it would be logical to draw the conclusion from this that when Royal Engineers had come to an end of their military employment, they must also come to an end of their civil employment. The only case in which an officer would come to the end of his military employment before arriving at the termination of his civil employment was where an officer had the bad fortune to be too old to pass his promotion examination.

71,660. With regard to the additional expenses of the Royal Engineer officer in civil employ he quite agreed that, being military charges, it seemed unreasonable to impose them upon the Public Works Department; he thought the Military Department ought to pay them.

71,661. (*Mr. Madge.*) The witness thought that although Royal Engineers were admitted into the Civil Department as a Military Reserve, the Civil Department obtained a considerable advantage by the introduction of Army officers.

(The witness withdrew.)

71,662. Captain Pollard-Lowsley subsequently put in the following Note comparing the pay drawn by officers of the Royal Engineers with Military Works Services in the Public Works Department under the Rules of 1911. (Government of India Resolution No. 63/82/E of 18th January, 1911):—

The attached Statement A compares the pay drawn by officers of the Royal Engineers in the Military Works Services and the Public Works Department from 2½ years to 35½ years after first Commission. An officer ordinarily arrives in India after completing 2 to 2½ years' service at about the age of 22 years, and will usually have reached the age of 55 after 35½ years total service, when he will—if in the Public Works Department—be required to retire. No allowance has been made for periods spent on leave, as it is extremely difficult to make such allowance with any accuracy, but the matter is considered generally below. Also no allowance is made on account of officiating appointments in either service.

(2) Statements B and C show that in the Military Works Services an officer would ordinarily draw Rs. 4,09,008, while in the Public Works Department he would ordinarily draw Rs. 4,69,320. The difference

between these figures (Rs. 60,312) does not, however, represent correctly the difference between the emoluments of the two Services for the following reasons:—

(i) In the Military Works Services an officer receives free medical attendance for himself, his wife, and children. In the Public Works Department free medical attendance is given only to the officer himself. It is permissible for an officer to compound with the Civil Surgeon for attendance on his family for one week's pay a year. If it be assumed that an officer is married by the time he reaches the rank of Captain, the deduction to be made on this account is Rs. $\frac{4,69,320 - 54,182}{52}$ = Rs. 7,983. Usually, Royal Engineer officers in the Public Works Department marry before they reach the rank of Captain, and it may be taken that this figure makes some allowance for periods spent on leave.

(ii) In the Military Works Services it is permissible for an officer to obtain two months' privilege leave a year, while in the Public Works Department only one month is allowed. It is true that in both services the leave is frequently unobtainable but for purposes of this comparison it must be assumed that the leave ordinarily is obtainable, and that the Military Works officer is paid for 10 months' duty and the Public Works Department officer for 11 months. If only one month leave were permissible in the Military Works Services, it would be reasonable to increase the pay of an officer in that service by Rs. $\frac{4,09,008 + 2\frac{3}{4}}{27\frac{1}{2}}$ = Rs. 40,900.

(iii) In the Public Works Department an officer of the Royal Engineers while on furlough receives pay at the rate of £500 a year, or half the last salary, whichever is least. In the Military Works Services an officer does not receive £500 a year on furlough until he has completed 24 years' service. It would be reasonable to allow, as the advantage secured by the officer in the Public Works Department on this account, a sum of £400 or Rs. 6,000.

(3) If the above be taken into account, the emoluments of the two services compare as follows:—

Military Works Services—Rs. 4,09,008 + 40,900 − 6,000 = Rs. 4,43,908.

Public Works Department—Rs. 4,69,320 − 7,983 = Rs. 4,61,337.

The difference between the emoluments of the services is, then, Rs. 17,429 in favour of the Public Works Department.

(4) Against this advantage in the shape of pay, the officer in the Military Works Services has the following advantages which it is not possible to assess:—

(*a*) He can continue in the service after the age of 55 and is eligible for promotion to the rank of General Officer, while an officer in the Public Works Department is obliged to retire at the age of 55. General officers are entitled to the following pensions:—

	£
Major-General	800 (per annum)
Lieutenant-General	900 ,, ,,
General (after three years from date of promotion to Lieutenant-General) ...	1,000 ,, ,,

In the Public Works Department an officer of the Royal Engineers cannot obtain a pension in excess of £700 per annum.

(*b*) As an unmarried officer, he is often able to live in a mess at a cheaper rate than an officer in the Public Works Department can live in his own bungalow.

(*c*) As a junior officer, he draws travelling allowance at Rs. 5 a day, while in the Public Works Department an Assistant Engineer draws Rs. 4 a day when his salary is less than Rs. 500.

(*d*) Stations in the Military Works Services are generally better than in the Public Works Department.

(5) The above notes show that while the pay of a Royal Engineer officer in the Public Works Department is, roughly, only about Rs. 17,429 better than that of an officer in the Military Works Services, the prospects and amenities of the Military Works Services are a good deal better than those of an officer in the Public Works Department.

F. M. PURVES, ESQ., Temporary Engineer (Irrigation), Punjab.

Written Statement relating to the Public Works Department.

71,663. [*Note.*—The first intimation received by Temporary Engineers that their Service would have to submit a Written Statement was received by wire No. 02253 E. addressed to Mr. F. Marshall Purves on the 6th October 1913. The time at disposal for the submission of a Statement, on a subject fraught with issues so momentous to a large body of Professional men, has been quite insufficient to admit of completeness. This Statement can only, therefore, deal with the general conditions of the Temporary Engineer Service, and it is earnestly requested that the various Provincial witnesses, who, it is hoped, will be summoned, be given opportunity to explain the special considerations affecting the conditions of Service, which vary in matters of detail in each Province.

The Non-controversial Written Statement prepared under the orders of the Government of India on the Public Works Department, makes no mention of Temporary Service, presumably because even now after over twenty years of regular employment, the Temporary Engineer has been allotted no recognised niche in the economy of State Service. It, therefore, becomes imperative that this one deals more fully with the Temporary Engineer Service than might, otherwise have been necessary.

The Provincial Service, which includes a somewhat smaller number of men than those in Temporary Service, has been allotted two Co-opted members and suitable representation by witnesses; but the latter Service has only to be represented by one general witness, which is quite inadequate, and it is, therefore, feared that the importance of the Temporary Engineer Service will not receive its just recognition.

This Written Statement does not deal with Temporary Engineers in the Railway Branch.]

71,664. The Public Works Department is composed of several Services, the members of which, though recruited on a differentiating scale, carry out the same duties in the various branches. The Services are distinguished as—

(1) Imperial Engineers, with certain favourable Rules; Imperial Engineers with less favourable Rules; and Royal Engineers.

(2) Provincial Engineers, with extremely unfavourable Rules.

(3) Temporary Engineers, with no fixed Rules, beyond those applicable to purely Temporary Service; a few Engineers, covenanted in England for fixed terms, are included.

The Department suffers greatly in efficiency from such a composition as that described above, and the general opinion of all India-recruited Engineers, which include a large proportion of Imperial Engineers, would seem to be that all Engineers should be on an equality in respect of all matters touching salaries, leave and Pension Rules, and general conditions of Service.

Many and various are the arguments in favour of, and against, the salaries of Provincial Engineers being on a lower scale than those of Engineers recruited in England. Justification for such differentiation would only exist if the Engineers imported were specialists. But there is no evidence to show that they are specialists in any higher degree than men trained in India.

It is not intended to further comment on the Permanent Services in this Memorandum, for, no doubt, full consideration has been given in their Memoranda to all questions of salary, service, etc. But it will be necessary to introduce the conditions of Permanent Service, for purposes of comparison. Without such comparison the disadvantages, which dog the Temporary Engineer in respect to pay, position and prospects cannot be placed in their correct perspective.

71,665. *TEMPORARY ENGINEERS.—Definiton.*—Temporary Service is one carrying a definite rate of pay sanctioned for a limited period (Article 77, Civil Service Regulations) and this kind of service has always been in vogue; but the present day Temporary Engineer is practically permanent and is in reality only temporary in name. 'This will be elucidated in the course of this Statement.

71,666. **Method of Recruitment:** *WITH BRIEF HISTORY.*—Hitherto there has been no special method of recruitment and men considered suitable have been, from time to time, added. So that the Service now includes:—

(1) Men with Diplomas from Indian and English Engineering Colleges,

(2) Men with experience gained elsewhere, and

(3) Men without Diplomas, who have been nominated and trained from the beginning, by the Government.

Over twenty years ago there was a great block in the Public Works Department and many members of the Department were, of necessity, kept in Sub-Divisional charge for periods extending to fourteen and fifteen years as Assistant Engineers. Government then appear to have adopted the principle of recruiting Temporary Engineers, *seemingly* to fill the lower posts for the purpose of facilitating promotion in the permanent ranks, without any consideration of the effect on the position and prospects of the Temporary Engineers, so employed, and without declaring such intention to those most nearly interested. Had this intention been made known few, if any, of the men of the class now in the service would have accepted so invidious a position, except from direst necessity. Synchronously with this form of recruitment special retirement rules were introduced, and recruitment to the permanent ranks was reduced to a very large extent, while the recruitment of Temporary Engineers continued with unabated vigour. The result of these measures was to largely deplete the Department of Permanent Engineers, and it became obvious that the Temporary Engineer must be employed permanently to keep up the strength of the Department, whose activities, in all directions, have increased enormously. In the earlier days attempts were made to recruit suitable men, on purely temporary work; but this proved to have been a failure, and it was seen that it would be most advantageous for Government to recruit young Temporary Engineers, train

them and employ them continuously without incurring any liability in respect of pensions. This latter procedure was specially necessary in the case of Irrigation Officers; for Irrigation is a specialised branch of Engineering, and whatever a man's Engineering knowledge, a sound training in his special work is essential in the case of an Irrigation Officer.

Though it was clearly understood several years ago that the Temporary Engineer had come to stay, and was in all respects, except pensions, practically permanent, no special rules with reference to recruitment, salary, leave, and general conditions of service were promulgated. As it was in the beginning so it is down to this time, that men—trained professional men— have to work on under conditions, which would not be tolerated in private concerns. That Temporary Engineers have borne patiently their burdens, has seemingly been assumed as a sign of contentment; but it does not appear to have been conceived as possible, that a sense of dignity would enable a Temporary Engineer Officer to suffer in silence, and a sense of duty support him to do his best under all conditions. It has generally been accepted that the employment of Temporary Engineers for long periods on general work *without special rules*, has been a serious mistake; but no one in authority has considered it either his duty to his Government, or to his neighbour to remedy, by some worthy scheme, the unhappy state of affairs. But one attempt alone has been made to face the situation, and that was by a former Secretary to Government, in January 1913, who suggested, that subordinates should replace Temporary Engineers, who in turn were to be cast adrift, because "Temporary Engineers become discontented and inefficient"—a comment as unhappy as unfortunate.

It cannot be wondered at that Temporary Engineers are discontented, but it comes as a surprise that, therefore, they are considered inefficient. If discontent spells inefficiency, then there are many others, besides Temporary Engineers, who might be classed as "inefficient." The scheme, however, since it offers no material advantages but the great disadvantages of increased expenditure with decreased efficiency, is not likely to be carried out to the bitter end. Thus the only attempt to do something—*anything*—to remedy a state of affairs which is becoming daily, both to the Government and to men concerned, more and more untenable, still leaves the Irrigation Temporary Engineer at least, where he was — neither wiped off the face of the troubled waters, nor impressed. Further on, proposals will be put forward which will possibly be found to be of equal advantage to Government and to Temporary Engineers generally. Unless the Service is vastly improved, false economy is bound to bring its own retribution, in the introduction of an inferior class of men, who, besides being less efficient, will not possess that high code of honour which has hitherto obtained and without which an important Department cannot be efficiently officered.

71,667. **Conditions of service.**—The appointment of every Temporary Engineer is sanctioned for 12 months at a time, for each calendar year, and every man is liable to discharge with one month's notice.* This is in accordance with what is known as purely Temporary Service. Temporary Engineers are employed ostensibly, as put forth in the Public Works Code to allow of the expansion and contraction of the Permanent Engineer Establishment, according to needs, and have no special rights and privileges. In actual practice, however, Temporary Engineers have really been employed as part of the regular permanent establishment, without one single right or privilege accorded to the Pensionable Permanent Establishment. That they are practically permanent is proved by the facts that:—

(1) They have to pass all Departmental Examinations and Tests under pain of loss of increment.

(2) They are forced to subscribe to a General Provident Fund.

(3) It has lately been decided by Government that increments shall only be given once every two years, *so that the Temporary Engineers may not rise too rapidly*. This latter clause leads to the obvious conclusion that the Temporary Engineer is to be retained for long periods. For, when a young man starts on 200 rupees per mensem, it will take him 24 years to get to the maximum salary of 800 rupees per mensem, with an increment of 50 rupees given every two years. Can it really be expected that any man will rest contented for several subsequent years before retirement, on a salary of 800 rupees per mensem? There are a very large percentage of Temporary Engineers, ranging from 5 to 42 per cent. of the Permanent Establishment in the various Provinces; and these men have been employed for long periods; so that the contention, hitherto put forward, that Temporary Engineers are employed for flexibility must go by the board; and is, under the circumstances explained, untenable. The enormous extensions taking place all over India to irrigation and other works, accentuates the fact that the Temporary Engineers at present employed, whatever the future may bring forth, must be retained in permanent employ; not only to carry out works but to adequately maintain them. What form that permanency might reasonably take will be discussed later.

The disabilities of the Service, as put forth briefly below, though in themselves serious enough, lead to much friction in detail between Permanent and Temporary Engineers, which ought not to be allowed to exist, as it detracts from general efficiency. It will serve no useful purpose to elaborate this statement by examples; but, when the members of one class of Public Servants carrying out the same work as another and more favoured class are treated as Ishmaelites, there is serious cause of apprehension that Government interests will suffer. The main grievances of most Temporary Engineers may be summed up briefly as follow:—

(*a*) Uncertainty of tenure of office in spite of years of loyal service.

(*b*) Insufficient prospects, with uncertainty and inequality in increase to salaries.

(*c*) Inability with reference to (*a*) and (*b*) to make future provision.

(*d*) The absence of any definite rules to suit the present conditions.

(*e*) The insufficiency of provident provision in lieu of pension.

(*f*) The exclusion of Temporary Engineers from any right to Divisional charge, and their consequent liability to serve under their juniors in the permanent service.

Before proceeding to formulate proposed remedies it would appear to be necessary and appropriate to give some details under the above headings, so as to bring out the fact that the grievances are real, and are the consequences of the existing conditions under which so-called Temporary Engineers are forced to serve.

(*a*) *Insecurity of Tenure.*—Though a man work as ten, and though his service be 5, 10, 15, or even 20 years he is annually reminded that he is less than mortal, in that his existence in the Department may only extend to one year, and that he may besides be discharged with one month's notice, and no question answered. This annual reminder must in time have a most baneful effect. It is seemingly intended as a protection; but a great Government should surely so treat its employés as to ensure that the conditions of the service, would in itself be a guarantee of good faith. Besides, Government still possesses the inestimable advantage secured by the faith of its employés in its eventual justice and fair treatment; however long that justice, as in the case of Temporary Engineers, be delayed.

The fact appears to be that no regular policy has ever been formulated by Government, with reference to Temporary Engineers and the line of least resistance was, in the beginning, eagerly followed. The doctrine of economy with efficiency has appeared such an easy solution, that its limitations have not been foreseen. Men have worked faithfully with always the eternal hope of good work being rewarded by better prospects. Young men, eager to work, have not been too particular to look into conditions of service, always trusting that Government would, of its

* *Vide* Appendix III.

own accord, and in its own interests, improve matters. Men have believed that in course of time they would be put on to the Permanent Service, and this hope has had foundation in the fact that several Temporary Engineers have at various times been given pensionable appointments. At various times men have been brought out from England on fixed covenants. At the end of their respective terms the majority of these men were transferred to the Pensionable Service, while others retired, and a few were brought on to the Temporary List. Temporary Engineers had thus a real grievance in that the men put on to the Pensionable List on the completion of their terms, were so transferred over and above the heads of many Temporary Engineers engaged in India, who were senior to them. The last of such men were transferred as late as September, 1911. The grievance lay entirely in the fact that men, senior to them were not likewise transferred to the pensionable staff. But apparently there has been no system whatever in the selections hitherto made; and it cannot be contended that the men placed on the pensionable staff were exceptional; for, in the Revenue work of Canals, a high average of excellence is the rule, and pre-eminence the exception. There have always been as good men, who are still on the Temporary List, as those made permanent. It was hoped that when the cases of Imperial and Provincial Engineers had received due consideration, the position of Temporary Engineers would also be improved. There is ample proof to show that Temporary Engineers now in service have done excellent work, in spite of the insecurity of their state. And the fact that so many men have outlived the conditions is a splendid proof of good work done, and it is not unnatural to speculate on the question as to how many, better paid pensionable men, would have stood the same test for years.

The fact that a Temporary Engineer can be got rid of with one month's notice, whatever his service, is often, or appears to often be, used as a means to lever him out without any regular enquiry, or without any charge made. The chance of replying to any alleged fault has been arbitrarily withheld; and as this is not done even in the case of permanent men in the lowest grades, who are given every opportunity of defence, it appears specially unfair in the case of officers.

(*b*) *Insufficient prospects, uncertainty and inequality in increase to salaries.* — The prospect held out to Temporary Engineers is gloomy in the extreme, and, as pointed out above, men have forced themselves to accept things in the hope of eventual betterment, and have preferred to hold to such possible chances, rather than become rolling stones. Government has practically the monopoly of all Engineering works in India, and specially in the case of Irrigation; so that once a man has specialised in this latter branch of Engineering, he may expect no appointments outside Government service. But other branches have also to specialise. And since Government has the patronage of practically all appointments open to Civil Engineers, the Government's responsibility, it will be admitted, can scarcely be said to end in the case of men who have served loyally and well for years when the last pay bill has been settled, at the end of the month's notice. But Government does nothing to aid a man to get employment elsewhere, though he be discharged for no fault of his own. It appears incumbent, therefore, that some endeavour should be made to secure the man further employment, considering that Government is in a far better position to ascertain where appointments are vacant, than the private individual.

According to the latest order a Temporary Engineer may not rise to more than Rs. 800 per mensem; except in very exceptional cases when the Local Government may employ men up to a salary of Rs. 2,500 per mensem for a total period of two years. According to the Public Works Department Code originally the maximum salary of a Temporary Engineer was fixed at Rs. 950 per mensem, in 1908 that rule was cancelled, but was only replaced lately, by a decree that Temporary Engineers were to get increments of 50 rupees after every two years of approved service, and would not rise to more than a maximum of. Rs. 700 per mensem. This latter has since been increased to 800 rupees. These orders have formed the subject of a Memorial by the Temporary Engineers, Punjab, copy of which is attached*. A perusal of this Memorial will bring to light, lucidly, the distinctly poor outlook of the Temporary Engineer. There are, however, several men who draw more than Rs. 800 per mensem; but it is presumed that this is because the order restricting salaries has only been lately issued.

In giving increments no special rule appears to have ever been followed. Some men getting annual increments of Rs. 50, with an occasional increment of Rs. 100; while others have received no increments for periods extending from two to five years. An increment is supposed to depend on the recommendation of a Temporary Engineer's immediate superior. One such superior may be satisfied with little, another may want a great deal before he gives his recommendation. Again, a special recommendation may be gained by chance on some special urgent work, or it may be held back because circumstances may have rendered it impossible for a man to show all the progress expected. The immediate superior's recommendations are endorsed or modified by the Superintending Engineer, and either acted on or otherwise by the Chief Engineer. One Superintending Engineer may have one criterion and another a different. Again, in the course of his tour, a Superintending or Chief Engineer might be impressed favourably by some work done by some particular Temporary Engineer. Enough weight does not appear to be given to the conscientious carrying out of "the daily round, the trivial task." This personal element is not allowed to influence the increments of Permanent Engineers and, therefore, should not influence those of Temporary Engineers. From what has been said, it will readily be seen that the want of system in granting increments is unjust to the individual, and is one of the many causes of discontent.

(*c*) *and* (*e*). *Inability with reference to* (*a*) *and* (*b*) *to make adequate provision for the future.*—Insufficiency of Provident provision. The market value of a Civil Engineer in India is fixed by the salaries given by the Government itself to its permanent staff, it is reasonable, therefore, to expect that the Temporary Engineer should at least draw the same salary as his permanent brother. But the fact, that he can hope for no pension, nor any provision in lieu of pension, renders it still more reasonable to maintain that the temporary man should get a higher salary. Pension is accepted as "deferred pay" and apparently is calculated at 25 to 33 per cent. of a man's salary. It might not, therefore, be unjustifiable for a temporary man to expect a higher salary, than the permanent men, of 20 per cent., a portion of which might be given in the form of better Provident rules. A Temporary Engineer has, along with his permanent brother to live like an officer and a gentleman, and is expected to maintain his official position in exactly the same degree; and thereby his ability to make provision for the future is considerably crippled, since his salary is uniformly less than that considered necessary for the permanent man of equal service. Upper subordinates, who are on the Temporary List, are usually given higher salaries than permanent men of equal standing, and it, therefore, is unjust that a Temporary Engineer Officer should be treated with less consideration.

It has been lately ruled that all Temporary Engineers must subscribe 9¾ per cent. of their salaries to a Government General Provident Fund, the interest accruing at the rate of 4 per cent. compound. Now it is quite possible, by judicious investment, to obtain a better return in India; so that in the long run the Temporary Engineer may gain very little from this enforced saving. This Provident Fund is, therefore, not entirely satisfactory, but it enables the Government to say at the end of a man's service that he is not quite destitute. Railway Temporary Engineers, however, have special rules, whereby Government adds from 75 to 100 per cent. of what each Engineer deposits. It will thus be clear that the Temporary Engineer has small ability to make adequate provision for the future, owing to increased

* *Vide* Appendix IV.

cost of living, and lower salaries than those considered sufficient for the Permanent Services.

(*d*). *Absence of definite rules.*—There are, as shown before, no satisfactory rules regarding salary and increments, no pension and most inadequate leave rules. Such leave rules as exist compare most unfavourably with those governing the Permanent Establishment, and as the reasons for granting leave to the former ought to be exactly the same as those applicable to the latter, the distinction is neither just nor humane. The leave rules of Temporary Engineers are for those in purely temporary employ, and are governed by the Civil Service Regulations, Articles 242, 336 (rule 1) and 339 (rule 2) and as laid down in Chapter I, para. 3, rule IV, of the Public Works Department Code, Volume I (9th edition). Accordingly, a Temporary Engineer is allowed privilege leave, if no substitute is required (Article 242-A), but as a favour the operation of this Article has not of recent years been put into force. Still the rule exists. But the time of taking such privilege leave is fixed by the consideration that the Temporary Engineer has to work for three months after his return before the termination of his services. That is, he must return from his privilege leave by the 1st October. And, during this period of three months enforced work, he is practically debarred from his right or option of terminating his service by a month's notice.

Furlough has occasionally been allowed as a special favour; but this has been restricted to one year, whatever a man's length of service.

It is hoped that it has been made abundantly clear that such leave rules as exist, having been formulated with reference to purely temporary service, do not, and cannot, satisfy the needs of the service as now existing.

(*f*). Whatever the length of service, no Temporary Engineer has any right to Divisional charge. And since Permanent Engineers, if found fit, have to be put into Divisional charges after ten years' service, and there are several Temporary Engineers with far more experience either under Government or elsewhere, it stands to reason that many such Temporary Engineers are forced to serve under their juniors. It needs no special perspicacity to see that such an arrangement is extremely detrimental to Government interests. The position of a youthful Divisional Engineer, who is supposed to keep in check and issue instructions and orders to a man his senior in service and experience is a very difficult one. He must, if he is wise, allow his Assistant an extremely free hand, or if he try the curb find himself professionally unseated. Again it is an accepted fact that after a certain period of work as an Assistant a man is better fitted for Divisional work and if a Temporary Engineer is kept too long as an Assistant, his work suffers and he is unjustly considered unfit, though he would probably make an excellent Divisional Officer. In any case Government interests must suffer. Further a subordinate raised to the Permanent Service, may in course rise to be the Executive Engineer of the Temporary Engineer, under whom he may have formerly served.

There are at present a few Temporary Engineers holding Divisions; but the tenure of such offices is insecure, for at any moment they may have to revert, to satisfy the demand of the younger permanent men who are attaining the service, after which they will lose salary, if retained as Assistants. In this as in all other matters where the interests of Temporary Engineers clash with those of permanent men, the former must give way, as having no rights or privileges (though many a moral claim) to consideration.

A further and more serious grievance, which affects all Engineers alike, but which has a greater effect on Temporary Engineers, is the method by which the system of Confidential Reports is worked. It is generally felt to amount almost to a scandal. If a man's conduct or work has been unsatisfactory a Confidential Report is the best medium for bringing such to the notice of higher authorities, for it protects the prestige and influence of an officer; but the substance of such reports should be brought to the attention of that officer, with the view of giving him a fair opportunity of explaining himself or of mending his ways; and to check any possible tendency on the part of a reporting officer to personal bias. Unfortunately cases, where men have misused the Confidential Report, are not entirely unknown. It is understood that in former times there was a rule that the purport of an unfavourable report should be communicated to the individual concerned; but this rule has either been cancelled or has fallen into disuse; and it certainly should be re-introduced.

71,668. *FINAL PROPOSALS.*—Memorials* setting forth grievances with prayer for reliefs have been submitted to the Government of India, by the majority of Temporary Engineers in India, who have been referred to the Royal Commissioners. The eventual solution of the questions which weigh so heavily on an important section of the Public Works Department, rests on the recommendations which may be considered necessary by the Royal Commissioners; and it is here earnestly requested and hoped that such recommendations will be made as early as may be consistent with other public interests. Since the improvements made in the Permanent Service in 1908, Temporary Engineers have been hoping for similar improvements in their service, and have thus already waited patiently for five long years, it is therefore hoped that such recommendations as seem fit and proper will not be delayed till the final operations of the Royal Commission are completed. "*Bis dat qui cito dat.*"

It has long been evident that Temporary Engineers form an integral part of the Permanent Establishment, and they perform the same general duties as permanent men, and are not now employed for special works. Nor can it be reasonably asserted that they are employed to give elasticity to the Department, for the majority have served for long periods, and since Engineering works are being extended and enlarged, Temporary Engineers are very likely to be employed for several years to come. In short the men now in service will have to be employed permanently, and even the youngest will, in all likelihood, be employed till he is superannuated at the age of fifty-five. The Civil Service Regulations themselves show that the principle of assuring a permanent tenure of office during good behaviour and efficient service, is generally admitted, and is, indeed, regarded, as of *supreme importance*. Therefore, it seems that all Temporary Engineers having proved themselves to be efficient and of permanent use to the Government should be placed on the Permanent Pensionable Scale. There can be no question, from any point of view, except that of false economy, but that this should be done; but the stumbling blocks hitherto in the way of this desirable solution have been—

(1) That the cadre list, which limits permanent Engineers to 946, is complete.

(2) That the introduction of several Temporary Engineers would interfere with the vested rights of certain Permanent Engineers.

With reference to (1), the increase of the cadre list lies in the hands of the Secretary of State for India, and there is little doubt that sanction to a reasonable increase could be obtained by a clear explanation of the situation, and by showing the necessity. Arguments in favour of such increase can be adduced, not the least being the great importance of having a contented body of men to carry out works of unlimited importance to the welfare of India.

Referring to (2), the Government Resolutions referred to before, have given a time scale of increments to all Permanent Engineers, with the proviso that, unless given Divisional charges after ten years of service, no further increment is possible. Can such a proviso be carried out with any justice? It is believed not, and it must follow that men will continue to get their increments regularly, even if not in Divisional charge. This will dispose of one aspect of the question. Now, the Divisional Officer—called the Executive Engineer—was in former years a true Executive officer; but time has brought many changes, and has increased his work so enormously that his work lies more in the administrative line than in the Executive. The work of Divisional charges has increased so enormously in late years, that it is no exaggeration to say that an Executive Engineer is unable to attend

* *Vide* Appendix IV.

to his work with any satisfaction to himself. It has become gradually most imperative to reduce the sizes of Divisions, so as to enable the Executive Engineer to pay more attention to his proper professional work which often has to be entirely carried out by his Assistant without sufficient checks. Smaller Divisions would enable the Executive Engineer to also give personal attention to schemes which, for want of time at disposal, have to be put off from day to day. Thus, by an increased number of Divisional charges, an absolute necessity as things now stand, the introduction of senior Temporary Engineers would have no malign effect on the existing prospects of the Permanent staff. It is, therefore, proposed that all Temporary Engineers now in service, who have completed four years' service, should be put on to the Permanent Pensionable staff. Temporary men in the Roads and Buildings, being so few in number, could readily be absorbed into the Permanent Service without special arrangements.

There are a certain number of Temporary Engineers with Diplomas from Indian Colleges, which date back to a time anterior to that when Indian College Engineers were relegated to a Provincial Service; there are others with English Diplomas which are accepted by the Secretary of State as sufficient for the Imperial Service; there are still others who were brought out under covenants, with promises of permanency at the end of the covenanted period, who have been placed after completion of their terms on the Temporary List. It is expected, if the proposals set forth are accepted, that these three classes of Temporary Engineers will be placed on the Imperial scale of pay. There are, however, some men, to whom such pensionable service would not appeal, and these would be men who, having served elsewhere, have entered Government service somewhat late in life and would not be eligible for an adequate pension. For these men, and for those under four years' service, a special non-pensionable service should be inaugurated, on the following lines:—

(1) Salaries 10 per cent. above the Permanent scale, with annual increments.

(2) Leave rules in every respect the same as for the Permanent service.

(3) Provident Fund similar to that in force on all the great railways, namely, an equivalent of 10 per cent. of salary contributed six-monthly or annually by the Government.

(4) Men to be eligible for absorption into the pensionable service from time to time, which could be effected by a slight decrease in the recruitment of Permanent Engineers. This latter clause would possibly meet the desires of all the young men. All Provident Fund additions made by Government would, of course, be deducted, as soon as these men were placed on the Pensionable List.

Eventually this Permanent Non-pensionable List would cease to exist, except for the few men who found it more satisfactory not to accept pensionable appointments. The rules governing the regular Permanent Establishment would, of course, be in force for the Permanent Non-pensionable Establishment.

All new entrants needed in the future should be employed for fixed terms, with special leave rules and should, if the requirements of the service demand, be placed at the end of their terms on the Non-pensionable List, or re-engaged on fresh terms. Men could not complain that they did not realize their exact position, till too late.

Mechanical, Electrical, Architectural, and Sanitary Engineers, who are fully qualified and specialized, should be given permanency after a term of approved service; but it lies with the Government to decide whether these men should have a separate list or be brought on to the regular Pensionable Establishment.

If the Non-pensionable List alluded to above cannot be a Permanent List, six months' notice of termination of service on either side should be the minimum; and where work has been satisfactory, a man might be transferred to another Province, without break of service, if there is work to be done. And Government might certainly make some efforts to secure men other employment when services are terminated without fault.

71,669. To sum up briefly, it is proposed—

(1) To increase the Cadre List suitably, so that all Temporary Engineers, now of over four years' service, may be placed on the Pensionable List, with the exception of those to whom it would be of no advantage.

(2) To increase sufficiently the number of Divisions, which urgently need to be reduced in size, in order that Government work might be more efficiently carried out; that Imperial men on high salaries be suitably employed; and that certain permanent men need have no just cause of complaint that their rightful ambitions are curtailed by the introduction of senior Temporary Engineers.

(3) That all Temporary Engineers not so transferred to the Pensionable List be brought on to a Non-pensionable Permanent List, being granted all the rules applicable to the regular Permanent Establishment, with salaries and increments on 10 per cent. higher scale, and with special Provident Fund, and eligibility of transfer to the Pensionable Establishment.

(4) In the event of the Non-pensionable List not being made an additional Permanent List, notice of termination of service should be extended from 1 month to 6 months; men should be transferred from one Province to another, as needed, without break of service; and, if their further services are not needed by Government, some endeavour should be made to secure men employment elsewhere.

(5) That specialised Mechanical, Electrical, Architectural, and Sanitary Engineers should be placed on the regular Permanent Establishment or have proper rules governing salaries, increments, leave, etc.

It is not pretented that the proposals set forth above would be acceptable to all Temporary Engineers, for proposals have not been received from the men of some Provinces who have not had full time. Such proposals will have to be submitted later in the form of Supplementary Memoranda. But it is believed that in a general way the proposals will meet the just expectations of the majority of Temporary Engineers in Upper India, Burma and Central Provinces.

Mr. F. M. Purves called and examined.

71,670. (*Chairman.*) The witness said although it had been impossible for him to consult all his colleagues in India, the written statement comprehensively embraced all the points which Temporary Engineers desired to bring before the Commission. The proposals which he had made might not be acceptable to all Temporary Engineers, but they would be acceptable to the majority. They certainly met with the assent of Temporary Engineers in Upper India.

71,671. There were about 253 Temporary Engineers in the various branches of the Public Works Department. There were 75 employed on railways, about 150 employed in the Irrigation Department, and the remainder were employed on Roads and Buildings.

71,672. With regard to length of service, the witness knew of one Temporary Engineer who had served 23 years. Taking the whole of India he should say that about 15 per cent. of the men had served over 10 years. Very few Temporary Engineers had been discharged. During the last 23 years he could only recollect about five cases in the Punjab Irrigation Works. He did not think the total number could be 10 or 11. On the construction side work was continually going on, and there was no chance of any Temporary Engineers being turned out.

71,673. There were about 20 Temporary Engineers who were at present holding executive charges. Twelve Temporary Engineers were drawing over Rs. 800.

71,674. The witness would recommend increasing the permanent cadre so as to absorb all the Temporary Engineers of four years' service, besides which he would increase the number of divisions, with a view to avoiding injury to junior permanent officers. He would also re-cast the cadre for certain Provinces which had gone far ahead of other Provinces in the way of construction works because the result of not doing that in the past had resulted in men getting charge of divisions far earlier than they ought to have

done, to the detriment both of the Government and of themselves. He advocated increasing the number of divisions, not merely for the sake of absorbing the Temporary Engineers, but because he thought from his practical experience that more divisions were required. He should say that about 10 or 12 extra permanent divisions were wanted in the Punjab.

71,675. With regard to pension, there was a rule in the Civil Service Regulations that any unbroken service of a temporary man put on to the permanent establishment counted towards pension from the date he was first employed as a Temporary Engineer. The witness thought that for certain Temporary Engineers a special non-pensionable form of service might be inaugurated. He also suggested that such officers should have 10 per cent. more than the permanent officers, and at the same time the benefit of a Provident Fund similar to the State Railway Provident Fund.

71,676. The witness thought there was good ground for the complaint that Temporary Engineers did not realise their exact position on entering the Service until it was too late. If the witness had been told at the end of his first year that he could leave, he should have gone and obtained better employment elsewhere; but he was told he would be re-engaged if he cared to stay on, and he did so, seeing there was a chance of permanent employment. After a certain number of years he became a specialist in Irrigation work, and it would have been quite impossible for him then to have left Irrigation, whatever his terms were, to find employment in any other branch of engineering. The Government had him in the hollow of their hands, and it had held him there ever since. He had been stationed on Irrigation works for 23 years, and for all practical purposes he was a permanent Executive Engineer, the only difference being in salary and pension. He stated that during his 23 years' service he had been re-engaged from year to year.

71,677. With regard to his complaint as to the recent decision under which Temporary Engineers had been brought on to the General Provident Fund, he did not think there had been a general demand on the part of Temporary Engineers to be included in that fund, because a very large number of them had not joined on the ground of insufficient salary.

71,678. (*Sir Murray Hammick.*) He had been in the temporary service for 25¼ years, beginning work on the Bengal-Nagpur Railway, after which he went into the Irrigation Department. The witness agreed that the Government had never given him to understand that his service was anything but temporary, but he had had hopes of permanancy, because Temporary men had been from time to time drafted into the pensionable establishment. With regard to the suggestion that Temporary Enginers had no better claim than a person who was in the employ of a company or private firm, and who was, under his terms of employment, liable to be discharged at a moment's notice, the witness urged that Government was really the sole employer in India. If there were a sufficient number of private firms in the country, perhaps engineers would not mind so much. They might get employment with private firms, but Irrigation was an absolute monopoly of Government. The witness stated that few young men, eager to work, looked closely into conditions of service at first, and it might have been his own fault that he did not bother much about the conditions when he first joined; but that he considered that he certainly should have been given a better salary and he doesn't bother now as the Government cannot now dismiss him.

71,679. (*Mr. Abdur Rahim.*) When Temporary Engineers were appointed to the permanent cadre, it was not by any means the general rule that they were appointed to the lower grade. It was one of their complaints that there was no fixed rule of any sort to govern the amount of salary payable to a Temporary Engineer.

71,680. If a man was not very useful to the Department he was at once discharged, and the terms under which Temporary Engineers were employed gave a great deal of discretion to the Government as to which men they should keep on. Temporary Engineers are not kept on through favour or influences, but solely on their merits. In short, they are not what is known to Indians as "*parwastis.*"

71,681. (*Mr. Madge.*) With regard to the three sources of recruitment set out in the written statement, the witness thought there was an objection to recruiting for the same service men whose qualifications could not be co-ordinated, but he did not desire to raise a point of that kind, because Government employed its own class of men, and if it chose to expend money in teaching those men, there was no harm done to the witness, at all events.

71,682. The witness thought there would always have to be a certain number of temporary men, but these men should be employed on special terms. He was formulating a scheme as to how the cadre might be worked with the least possible number of Temporary Engineers, and he would be pleased to send it to the Commission in due course. In the majority of cases all the appointments which the temporary Engineers held were really permanent, but partly for reasons of economy temporary men on lower salaries were employed.

71,683. The witness said he made the suggestion that both the cadre and the number of divisional charges should be increased, not only in the interests of the permanent men, but in the interests of the Service generally.

71,684. (*Mr. Macdonald.*) The witness had calculated that the pay of a young Temporary Engineer should be higher than that of a Permanent Engineer by 20 per cent. of which 10 per cent. would be increased salary and 10 per cent. deferred pay. He thought under such an arrangement men of as good a quality as the Permanent Engineers would be obtained. If an equivalent rate of pay was given, he agreed there was no reason why Government should not say they only wanted a certain number of permanent men, and that all the other men they required should be taken on just as though Government were an outside contractor.

71,685. The witness did not agree in the least with the statement put forward by various witnesses that the work of the Temporary Engineer taken as a whole was markedly inferior to the work of the Permanent Engineer. In his 25 years' service witness had worked alongside of Permanent and Temporary Engineers, and also had had both classes of men under him, and certainly did not see *any* difference in work.

71,686. Every year a certain number of men came out of the colleges who might be used as temporary men, so that if the officers in charge of work were dissatisfied with their existing temporary staff, they could discharge the men who were not giving satisfaction and take on new men. The market was always being supplied every year, and consequently if the average standard of Temporary Engineers' work was markedly lower than the average standard of Permanent Engineers' work, the responsibility rested with the superior officers, and not with the Temporary Engineers. Permanent Engineers could be lazier than Temporary Engineers, and the very conditions of the service could *not* make their work superior to that of temporary men.

71,687. (*Mr. Fisher.*) When the witness stated that Government had a monopoly of all the engineering works in India, he had not overlooked the fact that there were engineering works undertaken in the Native States, but the Local Government always employed men of their own State, the better appointments in Native States being monopolized by retired Chief Engineers, and other high officials.

71,688. It was not exactly the case that Irrigation work was so highly specialised that a man who had been a long time at it was, *ipso facto*, disqualified from undertaking engineering work of another kind, but the witness would not have the same chance of getting the same terms on a railway as a man who had been 23 years on railways.

71,689. (*Mr. Sly.*) It was the fact that every Temporary Engineer on joining signed a declaration that

he clearly understood the conditions of his temporary employment and accepted them in the just hopes of better things, and that he also received every year throughout his service a notice with regard to the retention of his services, which also clearly stated that he was employed on exactly the same terms; but the witness contended that such conditions were not understood by a man when he signed them. The witness put forward no legal claim of any sort, but he thought the fact of a man being employed year after year nullified those conditions, in spite of the fact that they were brought to his notice every year, and that Temporary Engineers had a moral claim on the Government of being made permanent, when they served Government so well, year after year, and under equal conditions of service as permanent men.

71,690. He agreed that, if his services were to be retained on uncertain tenure and small prospects, his real grievance against the Government was that they had not dismissed him at a proper age, when he had chances of bettering himself.

71,691. The engineering duties of a Revenue officer in the Irrigation Department were to look after the maintenance of his channels, and to keep them in proper condition, so that the supply of water was properly distributed. He had also to consider a large number of hydraulic engineering questions which were of the utmost importance, such as the designing of outlet and distributory heads, and he had to see that channels were kept up to certain designs, and to change designs if need be.

71,692. (*Sir Theodore Morison.*) The last occasion on which advertisements were issued for Temporary Engineers for the Punjab Irrigation was in 1890 or 1891. There was still a fair field of men from which Government could select; at the present rate of wages and conditions of employment, Government could obtain as many young men as it required.

(The witness withdrew).

Rai Bahadur Lala Baij Nath, Executive Engineer, Punjab.

Written Statement relating to the Public Works Department.

71,693. *INTRODUCTORY.*—I appear as a Representative of the Association of Indian College Engineers, of which I am the Honorary General Secretary. Nearly 75 per cent. of the Provincial Engineers throughout India and Burma are its active members. The rest have full sympathy with its work and aims but are not actually enrolled.

(2) I passed out of the Thomason Civil Engineering College, Rurki, in 1897, the first batch of the Provincial Service from Rurki having come out in 1895. The Association was started in 1901-02 when the Provincial Service was just in its 7th year; and in accordance with para. 10 of Resolution No. 2523 G. of 1893, it was fully expected that the re-organisation of the Service would be reconsidered and the Provincial Service abolished. Memorials were sent up by all officers then in Service, and ever since then the Association has been strenuously but most respectfully representing, by means of Petitions and Memorials, the claims of Engineers entering the Indian Public Works Department from the Indian Colleges, to the same treatment as accorded to Imperial Engineers, and to a restoration of their position and status in the Department to what it was before the backward step of creating a Provincial Engineer Service was taken by the Government of India in 1892.

(3) The various Memorials and Petitions from the Provincial Engineers, ranging over a period of 6 years (1902 to 1907), instead of having the desired effect, resulted in the least expected Resolution No. 675-694 E., dated 24th April, 1908, which practically aimed at the complete separation of the Imperial and Provincial Engineer Services, and thereby the complete degradation of the latter. Discontent among the Engineers, recruited from the Indian Colleges since 1895, was already keen, but this Resolution made it very much keener. A large majority of the men refused to accept terms of service which departed from the original conditions on which they were induced to enter Service and which aimed at a further degradation of their status. The rest of the constitutional struggle through which the Service has passed is well known, and this Association did its level best to place the case before the authorities in the most respectful and the clearest manner possible. The Government of India Resolution No. 439-458 dated 15th May, 1912, abolished the fresh distinctions and disabilities which were attempted to be created by the 1908 Resolution.

(4) But even by this 1912 Scheme, the case was not finally settled, and on the 15th May, 1912, in reply to certain questions asked in the House of Commons, Mr. Montague, Under-Secretary of State for India, made the following statement in connection with the case of Provincial Engineer Service:—"That it was impossible to state exactly when the decision would be reached in this most difficult and complicated case. The Secretary of State in Council had already sanctioned certain increases in pay, which, he hoped, would satisfy those interested, but had found it necessary to reserve other parts of the Government of India's proposals for further consideration. The matter would be expedited so far as was possible till a final decision was reached on all issues. Lord Crewe was not prepared to consider the laying of papers on the table." The "increases in pay" referred to above are those granted in the 1912 Scheme, which merely gave what had been proposed to be withheld and taken away by the 1908 Scheme.

(5) On the 10th October, 1912, again, in the House of Commons, the following questions were asked to which the Under Secretary of State gave the replies quoted below:—

Questions.

(*1.*) "Whether a final settlement had yet been arrived at in the case of the Provincial Engineers; would he state what were those parts of the Governments of India's proposals which had been reserved by the Secretary of State for further consideration, and when a decision upon them would be taken?"

(*2.*) "Whether it was proposed to restore, either completely or partially, to the Imperial Service, those Provincial Engineers who had received their training at Indian Engineering Colleges?"

(*3.*) "Whether the Secretary of State would arrange that the members to be co-opted on the Public Services Commission, to represent the Provincial Engineer Service, should be taken from those who might be duly elected for the purpose by the Provincial Engineers themselves?"

Replies to above questions.

(*1.*) and (*2.*) "As the Hon'ble Member was informed on May 15th last, orders have been passed sanctioning certain increases of pay to the Provincial Engineers. The subject reserved for future consideration is practically the one mentioned in the Hon'ble Member's second question, *viz.*, whether any change shall be made in the system of recruitment for the Imperial Service, and if so, under what limitations and conditions, so as to allow the appointment or promotion to that Service of Engineers trained in India. This subject is covered by the terms of reference to the recently appointed Royal Commission on the Public Services in India."

(*3.*) "The procedure to be followed in the matter mentioned, has not yet been settled. In any case the selection of co-opted representatives will be for settlement by the Royal Commission itself."

(6) From the above extracts from announcements made in the House of Commons it will thus be seen that the 1912 Resolution was, quite unexpectedly, silent on the question of the restoration of Indian College Engineers to their former status. They now look for redress of this long standing and sore grievance to the Royal Commission on the Public Services in India, and this Association strongly but most respectfully urges that the discontent created by the introduction of the Provincial Engineer Service since 1892, be removed by its abolition, and the former status of the Engineers recruited in India be restored to them. With this representation the Association has submitted already 50 copies of the 2 Memoranda* in which the case is fully set forth.

* *Vide* Annexures I. and II.

(7) Again, the Association knows that every Indian-recruited Engineer who has joined the Department since 1895, most keenly feels and resents the anomalous position in which he is placed, and the case therefore calls for an immediate redress being granted. The whole body of Engineers recruited in India therefore, through their Association, most respectfully beg that an *ad interim* recommendation be made by the Royal Commission in connection with the case of the Provincial Engineer Service, so that no more delay may occur in its final decision.

(8) I will not here repeat the various arguments advanced in those two Memoranda, but will confine myself to give, in brief, the conclusions arrived at by the Association, after full and mature deliberation under the various heads laid down by the Royal Commission.

71,694. **(I.) Method of Recruitment.**—The Association wishes to urge that recruitment both in India and England should be (*i*) by free and open competition, and (*ii*) half in India and half in England for the present, and as time goes on, the proportion of recruitment in India should be gradually increased. The Association also wishes to emphasize that this competition should be real and that at least 3 candidates should compete for each appointment.

71,695. **(II.) Systems of Training and Probation.**—*Training.*—The Association is of opinion that the training in England is not wholly directed to the requirements of this country, while that imparted in the Colleges in India is entirely so directed. The appointments made in England should also be by an open competitive examination in which subjects must be specially chosen and must include one Indian Language so that the training there may be directed to Indian requirements.

Probation.—There must be at least one year's probation *in India* for English recruits also. This is especially necessary as new recruits from England take at least 2 to 3 years to gain sufficient knowledge of Indian conditions and Languages.

71,696. **(III.) Conditions of Service, (IV.) Conditions of Salary, (V.) Conditions of Leave, and (VI.) Conditions of Pension.**—Under these heads the Association emphatically but most respectfully urges that whether an Engineer is recruited in India or in England, his emoluments and other conditions noted above should be precisely the same, and should be determined solely by the work he does and responsibilities he bears, and should have nothing to do with the place of his recruitment. "Same work, same wages" is the only equitable principle in this connection.

71,697. **(VII.a) Limitations in the employment of Non-Europeans.**—In the Public Works Department there should be no limitations based on grounds of color, caste, creed, domicile or place and source of recruitment. There should be an open door for all His Majesty's subjects through unrestricted open competitive examinations both in India and England.

71,698. **(VII.b) Working of the existing System of division of Services in the Public Works Department into Imperial and Provincial.**—The division of services in the Public Works Department into Imperial and Provincial has been a failure and has resulted in nothing but discontent and want of harmonious working and *esprit de corps* in the Department. The creation of the Provincial Engineer Service was a mistake. It is high time that this mistake is rectified and this Provincial Service abolished. The various arguments showing:—

(i) that the recommendations of the Public Services Commission of 1886-87, on which the introduction of the Provincial Engineer Service was based, are not sound;

(ii) that it was not justifiable to give effect to those recommendations.

(iii) that the policy advocated by that Commission has not been consistently followed; and

(iv) that it is now eminently desirable to abolish the Provincial Engineer Service,

are fully set forth in the Blue Statement submitted by this Association.*

I particularly draw attention to the speech of Sir William Muir, Lieutenant-Governor of the United Provinces, delivered at the Convocation address at Roorkee in 1873, from which the following extract can bear repetition, and which is looked upon by Roorkee Engineers as a definite assurance and a pledge from the Government of India:—"But apart from personal associations, there is a reason which renders the present moment one of Public interest; the establishment in England of an Engineering College for India has unsettled the minds of the public here as to the prospect of this Institution and the continuance to it of the patronage of Government. It has been a subject of much anxiety to myself, and of correspondence with the Government of India. It is, therefore, with sincere satisfaction that I am able to announce to you and through you to those without, who are interested in the Thomason College, that the Institution at Coopers Hill *will in no degree affect the relations of the Government of India with this College, nor the employment which has been hitherto guaranteed to its more successful students.* Between the two seminaries there will be no opposition or antagonism. The requirements of this great country are ample for both. I am sure that you will all with me be thankful to the Governor-General in Council for the justice which has thus been rendered to Rurki College."

71,699. **(IX.) Other points.**—(1) There is no analogy whatever between the case of Indian-trained Engineers and the Provincial Services of other Departments. Therefore there is also no sound argument against the abolition of the Provincial Engineer Service on the ground that this would entitle other Provincial Services to similar treatment.

(2) The Association is of opinion that the present Temporary Engineer Service is very unsatisfactory, and it is highly desirable that it should be regularized by regarding it as a permanent non-pensionable service on an incremental scale of pay.

(3) The Association understands that it is being hinted in certain quarters that the expenses of Indian Officers of pure Asiatic descent in the Department, are not so high as to warrant their being paid the same emoluments as are paid to Europeans and Anglo-Indians. This impression is altogether erroneous, and this Association, which consists of both Indian and Anglo-Indian Members, is anxious to remove it. The impression seems to have gained ground on account of want of insight into and lack of full knowledge of Indian life and customs. The channels of expenditure of an Indian may be different from those of a European, but they are as varied and numerous as those of the latter. An Indian has to support a family which, unlike that of a European, includes not only his wife and children but also a number of far and near relatives and dependants; and considering the rapid rise in prices, this causes a very heavy drain on his resources. Then he has to meet heavy expenses on the occasion of marriages and other social functions. It is not necessary to enter into the ethics of this question here but facts must be taken as they are. Besides, it must be recognised that educated Indians and especially Engineers have adopted European mode of living which is just as expensive in their case as in that of Europeans. As a matter of fact Indian Engineers have to keep in many cases, a double establishment of servants, horses, carriages, etc., on account of their social customs, which compel their families to stay generally at Head Quarters, while in matters of house rent, camp equipage, dress, etc., they are precisely in the same condition in which European Engineers are. Another point, in this connection, is that there is a great tendency for educated Indians to give their children the best education in India or abroad and this is a very heavy item of expenditure. When all is said and done, however, the principle of "same work, same pay" must be the guiding maxim in fixing emoluments, which should have nothing to do with any private or individual considerations.

(4) *Provincial Engineer Service—a young service.*—It is not out of place to point out that the Provincial Engineer Service is young and none of its members has put in more than 17 years' service nor entered administrative rank in any Province in India. It is

* *Vide* Annexure II.

hoped that the fact of the service being so young will not stand in the way of full weight being attached to its representations.

LIST OF DISTINGUISHED ENGINEERS.

(This list is as far as information has so far reached the Secretary).

(1) *From Thomason Civil Engineering College, Rurki.*

No.	Name.	Year of passing out.	Rank attained.
1	C. C. Anderson... ...	1851	Chief Engineer U.P.
2	Rai Bahadur Kanahaya Lal.	1852	Executive Engineer, Punjab.
3	E. Swetenham (Col.) ...	1853	Superintending Engineer, U.P.
4	H. Garbett	1854	Superintending Engineer, Punjab.
5	R. E. Forrest	1855	Superintending Engineer, U.P.
6	H. E. Whish (Lt.-Col)	1856	Superintending Engineer, U.P.
7	W. D. Brockman ...	1858	Superintending Engineer, U.P.
8	H. F. White	1859	Superintending Engineer, Rajputana and C.I.
9	Capt. W. K. Elles ..	1860	Lt.-Genl. Bengal Command.
10	W.H.Mackesy(Lt.-Col.)	1861	Superintending Engineer, M.W.S.
11	G. D'a. Jackson (Gen.)	1863	Superintending Engineer, Military Works.
12	F. D. M. Brown, V.C. (Lt.-Col.).	1864	Principal Thomason College, Roorkee.
13	W. C. Wright	1864	Chief Engineer, Rampur State.
14	H. L. Monk	1865	Chief Engineer, Railways.
15	A. C. Wither (Lt.-Col.)	1866	Superintending Engineer, Bengal.
16	J. F. Miller (Lt.-Col.)...	1868	Superintending Engineer Punjab.
17	C. G. Palmer, C.I.E. ...	1868	Chief Engineer, U.P.
18	R. E. Nelson	1869	Superintending Engineer, Burma.
19	J. S. Slater	1870	Principal Civil Engineering College, Sibpur.
20	A. R. Lilley	1870	Superintending Engineer, Railways.
21	J. T. Rollo	1870	Superintending Engineer, Burma.
22	B. Baxter	1871	Superintending Engineer, Railways.
23	E. W. P. Foster ...	1871	Egyptian fame.
24	J. R. Bagley	1871	Chief Engineer, Railways.
25	Sir W. Willcocks, K.C.M.G.	1872	Egyptian fame.
26	G. M. R. Field	1872	Chief Engineer, Punjab.
27	Sir W. R. Garstin ..	1872	Egyptian fame.
28	Rai Bahadur, Lala Ganga Ram, C.I.E.	1873	Superintendent of Works, Delhi Coronation Darbar Works, 1903; and Superintending Engineer, Patiala State.
29	G. Humfress	1873	Superintending Engineer, Railways.
30	A. F. Higgins, K.I.H...	1873	Superintending Engineer, Bengal.
31	A. Grant	1873	Superintending Engineer, Hyderabad.
32	J. L. P. Hogan... ...	1873	Chief Engineer, Railways.
33	H. T. Gwyther... ...	1874	Superintending Engineer, Railways.
34	A. E. Rose	1874	Superintending Engineer, Burma.
35	Rai Bahadur, K. C. Bandopadhyay.	1876	Superintending Engineer, Bengal.
36	H. D. Granville ...	1876	Superintending Engineer, Punjab.
37	W. MacDonald... ...	1876	Chief Engineer, E.B. and Assam.
38	C. E. Housden	1876	Superintending Engineer. E.B. and Assam.
39	W. B. Gwyther... ...	1876	Chief Superintending Engineer, E.B. and Assam.
40	J. T. Farrant	1877	Chief Superintending Engineer, E.B. and Punjab.
41	W. A. Bagley	1877	Superintending Engineer, Punjab.
42	E. G. Foy	1877	Superintending Engineer, Burma.
43	C. S. R. Palmer ...	1878	Australian fame.
44	G. T. Oliver	1878	Superintending Engineer, Burma.
45	W. E. T. Bennet, C.S.I.	1878	Chief Engineer, Punjab.
46	G. M. Harriot, C.S.I., C.I.E.	1878	Chief Engineer, C.P.
47	J. Willcocks	1879	Superintending Engineer, Railways.
48	C. E. V. Goument, C.S.I.	1879	Chief Engineer, U.P.
49	J. G. Davis	1879	Superintending Engineer, Punjab.
50	Rai Bahadur, Kanhiya Lal.	1879	Superintending Engineer, B. and R. Punjab.
51	W. P. Housden ...	1881	Superintending Engineer, U.P.
52	F. E. Gwyther	1881	Chief Engineer, Punjab.
53	R. E. Purves	1881	Chief Engineer, Punjab.
54	H. W. James	1881	Superintending Engineer, Burma.
55	F. W. Vyal	1882	Superintending Engineer, Burma.
56	G. T. Anthony	1882	Superintending Engineer, U.P.
57	S. Athim	1882	Superintending Engineer, U.P.
58	J. M. Taylor	1882	Superintending Engineer, U.P.
59	F. O. Oertal	1883	Offg. Superintending Engineer, U.P.
60	Rai Sahib, R. Mittra ...	1883	Offg. Superintending Engineer, C.P.
61	C. Pratt	1883	Offg. Superintending Engineer, Railways.
62	E. J. Mitchell	1883	Superintending Engineer, E.B. and Assam.
63	F. W. Roberts	1884	Superintending Engineer, Railways.
64	R. J. Powell	1884	Superintending Engineer, U.P.
65	E. A. W. Phillips ...	1885	Superintending Engineer, Burma.
66	A. J. Wadley	1885	Superintending Engineer, Punjab.
67	Anad Prasad Sarkar ...	1885	Chief Engineer Bihar and Orissa (Place of recmt.).
68	Rai Bahadur Ralla Ram, I.S.O.	1886	Engineer-in-Chief, Railways.
69	C. H. Wollaston ...	1886	Engineer-in-Chief, Burma.
70	F. W. Schönemann ...	1887	Superintending Engineer, Punjab.
71	B. C. Lall	1887	Superintending Engineer, U.P.
72	P. N. Sen	1888	Superintending Engineer. Burma (place of recmt.).
73	F. T. Bates	1889	Superintending Engineer. Punjab.
74	H. W. M. Ives	1889	Superintending Engineer. Punjab.
75	F. W. Allum	1890	Superintending Engineer, Railways.
76	H. Hughes	1891	Superintending Engineer, Railways.
77	J. N. Taylor	1891	Superintending Engineer Punjab.
78	C. J. Floyd		Superintending Engineer Punjab.

Note 1.—Men who passed out in 1892 to 1894 have not yet reached that stage when they may get Administrative rank.

2. After 1894 the men have been classed as *Provincial Engineers.*

3. Some of the officers in the above list are those who were out-classed at Roorkee and did not get guaranteed appointments but were made Imperial from Tempy. Engineers.

(2) *From Poona College.*

(Prior to 1869 this College turned out only Subordinates and the first Engineer Officer passed out in that year).

1. Mr. Fardunji Kavasji Tarapurwala, B.A., L.C.E., C.I.E., 1876, retired a few years ago as Superintending Engineer 1st Class, Bombay.

2. Mr. M. Vishvesvarayya—1884—became Superintending Engineer 1st Class before he was 50 years of age—Chief Engineer Hyderabad State, Chief Engineer Mysore—now Diwan of Mysore State, not yet 55 years of age.

3. K. B. Mancharji Kavasji Marzban, C.I.E.—Joined the Department as a subordinate before 1869; retired as an Executive Engineer 1st grade; got Khan Bahadur 1877, and C.I.E. on 30th May, 1891—

on retirement joined the Bombay Municipal Service. Is alive, and is now 72 years old.

4. Mr. N. Belvadi—Joined 1891, became Superintending Engineer 1911, at the age of 43 only, and died in March, 1912, at 44 years.

5. Karpur Srinivasarav, B.Sc.; L.C.E., 1891, Superintending Engineer, Mysore.

6. Bangalore Kirishnarao B.A., L.C.E., 1891, Superintending Engineer, Bombay.

7. Vinàyak Trimbak Agáshe, L.C.E., 1892, Superintending Engineer, Bombay, and Sanitary Engineer.

GENERAL SECRETARY,
Assn. of Indian College Engineers.

ANNEXURE I. TO ABOVE.

Memorandum by the Association of Indian College Engineers relating to the Public Works Department.

71,700. **(I.) Methods of Recruitment.**—(1) The superior posts in the Department are recruited in 5 ways:—

(*a*) by the appointment of Civil Engineers obtained from England,

(*b*) by the appointment of Royal Engineers,

(*c*) by the appointment of successful candidates from the Indian Engineering Colleges,

(*d*) by the appointment to the permanent establishment of Temporary Engineers howsoever secured, and

(*e*) by the promotion of selected officers from the subordinate grades of the Public Works Department.

(2) Recruits from England are appointed by a Selection Committee at the India Office without competition. The annual recruitment from this source has varied. The number during a series of years has averaged 30 (*vide* the reply given to a question asked in the House of Commons on the 19th April, 1911). The annual recruitment in India is approximately 14, *viz.*, 9 from the successful candidates of the Indian Colleges and 5 from selected subordinates.

(3) The proportion of recruits from England and from Indian Engineering Institutions, *i.e.*, excluding promoted subordinates, is thus approximately 30 to 9. That is to say, only 20 per cent. of the total annual recruitment is obtained from the Indian Colleges and 70 per cent. from England. The remaining 10 per cent. is obtained by selection from the subordinate grades. In other words 80 per cent. of the total annual recruitment is made by selection, while only 20 per cent. is made by open competition.

(4) This proportion of recruitment from the Indian Colleges, which, be it remembered, are institutions maintained at great cost to the State, is thus very small as compared with that from England. This proportion of recruitment should be contrasted with the position existing at the time of Public Service Commission of 1886-87 and with the recommendations of that Commission. It will be noticed (*vide* page 362 of Appendix O of the Appendices to the Report of that body) that the annual recruitment from England and from the Indian Colleges was, at that time, in the proportion of 21 to 9, that is to say, the Indian Colleges received 30 per cent. of the total annual appointments. It is, therefore, manifest that, notwithstanding the fact that the said Commission recommended a gradual increase in the annual number of appointments to be given to the Indian Colleges by reducing the English recruitment, the reverse has in fact transpired. English recruitment has gradually increased while the recruitment from Indian Engineering Colleges has remained absolutely unchanged.

(5) It is asserted that the legitimate aspirations of the public in India cannot be satisfied unless a greater proportion of the superior appointments in the Public Works Department are reserved for competition in this country. It is suggested, as a suitable remedy, that at least 50 per cent. of the total annual recruitment be made in India at present, and that this proportion should be gradually increased as conditions change.

(6) Again, as regards the system of recruitment in England, the method of selection at present in vogue is decidedly faulty and should be discarded for a system of open and unrestricted competition in which there should be no racial limit whatsoever. This system already prevails in India.

71,701. **(II.) System of training and probation.**—*Training of men recruited from England.*—There is no guarantee that the preliminary training obtained by these recruits is such as to meet the requirements of the Profession in India. The training should undoubtedly be specifically directed to one end, *viz.*, the efficient performance of the duties required of an Engineer in India. This can only be secured by Competitive Examination, in which the subjects must be specially chosen and should include one Indian language. The competition must be real, that is to say, the number of appointments offered must not in any year exceed a fixed proportion of the number of competing candidates. A suitable arrangement would be that the appointments offered in any year should not exceed one-third of the number of candidates in that year. This suggestion is by no means unfair when considered with the conditions frequently prevailing in the Indian Engineering Colleges. For example, it has happened at Rurki College that 18 to 25 candidates have competed for 5 or 6 appointments. Again, at the Poona College it has frequently happened that no less than 40 or 50 candidates have competed for one single appointment.

Training of men recruited from the Indian Engineering Colleges.—The training imparted in these institutions, it is considered, is sound and fairly exhaustive. This fact has, moreover, been publicly admitted by eminent persons, such as Lord Macdonnell, and Sir J. P. Hewett, &c. Again, the training is directed wholly to the requirements in India. It is, therefore, submitted that, from the point of view of Indian requirements, the training received by Indian College Engineers is, in fact, superior to that received, on the average, by Engineers obtained from England. In addition, the Indian College recruit possesses the great and acknowledged advantage of having received his training in the country in which he has to practise his profession.

Probation.—The training received by the alumni of the Indian Engineering Colleges is further supplemented by a period of training on probation for one year in the Department which is not the case with recruits obtained from England. This probationary period in the Department in India is absolutely necessary and should be insisted upon as an indispensible condition and it should, in addition, be a probationary period in the strictest sense, involving selection and a possibility of rejection at the end of it. Any plea that this is unfair, or will deter candidates from England, by reason of the attached risk, may be met by the provision of free return passages to rejected probationers. This, except for the free passage, is exactly what prevails at the present moment in the case of recruits from the Indian Colleges.

71,702. **(III.) Conditions of service.**—The conditions of service of recruits appointed in England and India differ very considerably, and this is the sole cause of the great discontent which prevails among the latter class of officers throughout India. Notwithstanding the fact that both classes of officers are recruited for and required to do exactly the same work and bear the same responsibilities the position of officers recruited in England is more favourable, in many respects, as compared with that of officers recruited in India. The policy which has, in fact, prevailed since the date when effect was given to the recommendations of the Public Service Commission of 1886-87 has undoubtedly been a melancholy one, of monopoly and exclusion and consistently adverse to the interests of the Indian trained element. The position, thus created, is absolutely illogical and unjust and cannot, in view of the surrounding circumstances and the past history of the department, be supported. The facts and arguments urging the reversal of the policy now in vogue and the restoration of the alumni of the Indian Engineering Colleges to the position they formerly occupied (that is on a full equality with Engineers from England) are fully

set forth in the annexed Memorandum,* which it is requested, may be closely studied.

71,703. **(IV.) Conditions of salary.**—The pay of the Indian recruited element is approximately two-thirds of that granted to officers recruited in England. This is utterly unfair and unsuitable. The resulting anomalies and defects are startling and are as follows:—

(*i*) The minimum pay of Indian trained Executive Engineers is much less than the maximum pay of Imperial Assistant Engineers;

(*ii*) The minimum pay of Indian trained Superintending Engineers is less than the maximum pay of Imperial Executive Engineers.

(*iii*) Anomalies exist in connection with local allowance as stated below.

(*iv*) Generally the pay granted to the Indian trained element is inadequate and is not commensurate with their work and responsibilities.

It is clear that Indian trained Engineers, under conditions now prevailing, will receive less pay than their own subordinates. This position is untenable. It is contented that emoluments should depend solely on services rendered, and that this distinction between two classes of officers who do the same work and bear the same responsibilities should be obliterated.

Local Allowances.—Similarly, Indian trained Engineers receive two-thirds the local allowances granted to officers obtained from England. This difference is unjust, for the said allowances are always given for a specific purpose, that is, as compensation for local disabilities which equally affect both classes of officers.

Probationary Period.—Not only have Indian trained Officers, as already explained, to undergo a probationary period and incur the consequent risk of rejection, but even after completing such probation, the period so spent is not counted for increments and promotion. This causes great inequality between the two classes of officers.

It is contended that there should be absolutely no distinction in the matter of emoluments, of whatever nature, between the two classes of officers.

71,704. **(V.) Conditions of leave.**—Here again there is much disparity between the conditions applying to each of these two classes of officers. Great stress has been laid on the advantage to be derived by an Engineer in visiting works in foreign countries and the element recruited in England has received undue credit on this account. Unless the conditions of leave are the same, it becomes impossible for Indian trained men, even if they desire to do so, to secure the same advantages in this direction as English recruited Engineers. Again, the nature of an officer's duties in the Public Works Department involves continued exposure and discomfort for long periods and the health of an Indian trained officer suffers equally with that of imported men. There is, therefore, no reason whatever to perpetuate the present distinction. Indian College Engineers should, therefore, receive exactly the same leave conditions as their contemporaries recruited from England. It is generally recognised that Indian recruited Engineers break down in health, much earlier than men obtained from England, and this is due to insufficient leave. Again, officers recruited in India in certain other services, *e.g.*, the Traffic, Accounts, Opium, Finance, etc., are under more favourable leave rules, and there is no reason why Indian trained Engineers should not be on an equal footing with these other services.

71,705. **(VI.) Conditions of pension.**—Here again there is a much resented distinction, *vide* art. 636, Civil Service Regulations, which will create invidious and unjust anomalies. For example, an Indian trained Chief Engineer will draw less pension than his own subordinates recruited in England. It is submitted that it is a well and universally established principle, that pensions are granted as retiring provisions for specific services rendered to the State, and it is therefore illogical and unjust to create or maintain any distinction in this direction between persons who have in fact rendered exactly the same services. In other words, pensions ought to be wholly and solely dependent on specific services rendered and not on place of original recruitment, for this does not involve any special merit.

71,706. **(VIIa.) Limitations in the employment of Non-Europeans.**—As urged above the Department should be recruited half from England and half in India for the present. The recruitment in England should be open to all British subjects equally, irrespective of domicile, colour, caste or creed. Latterly, during the existence of Cooper's Hill College, only 2 Indians were iligible for appointment even after competition, and at present the number of Indians eligible for appointment in England is limited to 10 per cent. of the total annual recruitment. Limitations of this nature should be barred.

71,707. **(VIIb.) Working of the existing system of division of services in the Public Works Department into Imperial and Provincial.**—The division of the Public Works Department into Imperial and Provincial sections has been anything but a success, and can never be so in view of the surrounding circumstances and the past history of the Department. The distinction created between the two classes of officers, who do exactly the same work and bear exactly the same responsibilities, is intensely resented and will inevitably result in splitting up the whole Public Works Department into two hostile camps, and this must greatly injure efficiency. The interests of the two classes of officers are now widely divergent, and this is conspicuous in their relations. Concerted action has become impossible and the general feeling of *esprit de corps* which formerly prevailed, has ceased to exist. In its place there will assuredly spring up a deep and widespread feeling of suspicion and distrust between the two classes of officers which must wreck harmonious working. So long as the two classes possess, on the average, equal educational and professional attainments, and this is undoubtedly the case, any differentiation between them is unworkable. It is impossible to force a distinction in pay when none exists in attainments, and any attempts to do so must create complications and raise issues which it would be as well to avoid. Again, it is, in fact, true that many Indian trained Engineers possess superior qualifications to some officers recruited in England. It is therefore urged that, the said differentiation, which is illogical and unjust, should be obliterated and extinguished, and that the alumni of the Indian Engineering Colleges should be restored to the position they formerly occupied, that is to say, there should be only one service in the Public Works Department.

71,708. **(IX.) Other points.**—(1) *No analogy with other Provincial Services.*—It is widely felt that the resistance offered to the oft-repeated prayer of the alumni of the Indian Engineering Colleges to be restored to the position they formerly occupied, that is, on an equality with recruits from England, is due in a great measure to the apprehension that if this is accepted, other Provincial Services will be entitled to similar treatment. It is submitted in reply, that the question of other Provincial Services is foreign to the point at issue. There is no parallel between the case of Engineers recruited in India and other Provincial Services. Engineers recruited in India are not situated in the same relation to Engineers recruited from England, as members of other Provincial Services bear to the Imperial Officers of their Services. But, on the contrary, except as regards pay, leave and pension, there is in all other respects no distinction between the two classes of officers in the Public Works Department. It is, therefore, submitted that any argument, opposing the restoration of the alumni of Indian Engineering Colleges to the position they formerly occupied on the ground that this would entitled other Provincial Services to similar treatment, is unsound and cannot be raised.

(2) *Temporary Engineers.*—The position occupied by these officers in the Department is undoubtedly most unsatisfactory and requires consideration. These officers are at present recruited in an irregular manner, *viz.*:—

(*a*). From Indian trained and duly qualified Engineers who failed to secure guaranteed appointments when competing for them.

* See Annexure II.

(*b*). From Engineers appointed under covenant in England.

(*c*). From unqualified persons appointed in India.

It is submitted that, except in special cases where experts are required, these officers should be recruited from qualified persons who have successfully undergone the prescribed training in any Indian Engineering College and that no other person should be engaged until this source of supply is exhausted. It is contended that this arrangement will be greatly beneficial to the State Colleges in India and will tend to attract suitable candidates. The present conditions under which these officers serve are not such as to secure efficiency. There is practically no security whatever, for these officers are liable to be discharged with very limited notice regardless of the length of their service. It is suggested that such service should be regarded as permanent non-pensionable service, and there should be an incremental scale of pay. The Service may be called the Extra Engineer Service, and may be divided into Extra Assistant and Extra Executive Engineer classes.

Annexure II. to above.

Memorandum by the Indian College Engineers relating to the Provincial Engineer Service.

71,709. (1) The question of the recruitment of the Engineer Establishment of the Public Works Department is one that has given rise to widespread and lasting discontent. It is generally felt throughout the country that the policy of excluding the Alumni of the Indian Engineering Colleges from the Imperial Service (*in which they were formerly included*) is unjust and should be abandoned.

(2) The following points which deal with this question deserve consideration, for they reveal that the situation has not, in fact, been adequately appreciated.

ORIGIN OF THE PROVINCIAL ENGINEER SERVICE.

(3) Prior to the institution of the Provincial Engineer Service by the Government of India Resolution No. 2112-G., dated the 19th July 1892, recruits from the Indian Engineering Colleges (one of which, viz., that at Rurki was established so long ago as 1847), were appointed to the Imperial Service, *i.e.*, on an equal footing with Engineers obtained from England. It has been repeatedly proclaimed [*vide* the Government of India, Resolution No. 2112-G. (mentioned above) and No. 675-694-E., dated the 24th April 1908, &c.] that the Provincial Engineer Service was the outcome of the recommendation of the Public Service Commission of 1886-1887. The issues which naturally present themselves are—

(*i*) Were these recommendations sound in themselves?

(*ii*) Was it justifiable to give effect to them?

(*iii*) Has the policy advocated by the Commission been consistently followed.

The following considerations show that the answer to each of these questions is in the negative and that therefore the institution and retention of the Provincial Engineer Service stands self-condemned.

PUBLIC SERVICE COMMISSION OF 1886-1887.

(4) The report of that body states that its recommendations were based on two grounds, viz.:—

(*i*) that the considerations which led it to recommend the formation of Imperial and Provincial Services, in respect to the various branches of the Civil Service, with distinct conditions of service applied with equal force to the Engineer Establishment of the Public Works Department, and

(*ii*) that Engineers recruited from England received a better professional training than that which the Indian Colleges were capable of affording.

(5) *Ground No.* 1.—Here the Commission were distinctly in error because there was absolutely no analogy (and this fact has been admitted) between the case of the various branches of the Civil Service and that of the Engineer Establishment of the Public Works Department.

The following statement contrasts the facts of the case of the various former branches of Civil Service recruited in India with those of the case of Indian trained Engineers:—

Case of the various branches of the Civil Service.	*Case of Indian trained Engineers.*
(*i*) There had always been a complete distinction between the various branches of the Civil Service recruited in England and India.	This was not the case with the Engineer Establishment of the Public Works Department, Engineers recruited in England and India were on precisely the same footing.
(*ii*) The Branches of the Civil Service recruited in India (now included in the Provincial Service) were formerly subordinate services and were *not* recruited for and required to do the same work and bear the same responsibilities as officers of the Imperial Civil Service obtained from England. The same remarks apply to most other Provincial Services, *e.g.*, the Survey, Forest, etc.	Engineers recruited in India belonged to a superior service. They were and are still recruited for and required to do the same work and bear the same responsibilities as their English contemporaries.
(*iii*) The Commission recognised that the branches of the Civil Service recruited in India were recruited in an irregular manner which was not conducive to efficiency. The Provincial Service was designed to regularise recruitment and did in fact considerably raise the status and improve the prospects of these services.	Indian trained Engineers were recruited from specially established institutions of long standing, one of which had been in existence for 40 years. Many of them had attained high administrative appointments. The Provincial Service was in the case of these Indian Engineering Colleges a retrograde measure, and greatly lowered the status and prospects offered to their successful students.

Furthermore it was virtually admitted by the Government when actually giving effect to the Commission's recommendations that there was no analogy between the case of Indian trained Engineers and those other services recruited in India, for the Provincial Engineer service, as instituted, was quite dissimilar to other Provincial Services. In short, except as regards pay, leave and pension, there was in all other respects no distinction between Engineers recruited in England and India respectively (*vide* Resolution No. 2112-G. dated the 19th July, 1892).

(6) *Ground No. II.*—This conclusion obviously could only have been arrived at from the evidence before the Commission which, be it mentioned, was not tested by cross-examination of the witnesses produced. A close scrutiny of the evidence will reveal—

(*i*) that it did not establish the inferiority of Indian trained Engineers, for many witnesses, including officers with the widest experience were of opinion that there was little to choose between the best Rurki Engineer and his English rival, and

(*ii*) that much of it was prejudiced for, speaking generally, the excellent records established by many Indian trained Engineers in the past were forgotten, the fact that *natives* of India had only recently begun to appreciate and practice engineering as a profession was not considered, and the fact that many Indian College Engineers were at that time holding high administrative appointments secured by competition with their English contemporaries was completely ignored.

(7) Even admitting, for the moment, that the evidence tended to prove that the Indian Engineering Institutions (which had done well enough in the past) had fallen short of the requirements of the day, the proper remedy lay in raising the standard of professional education imparted in them and not, as advocated, in making a differentiation between recruits from them and Engineers obtained from England.

(8) Again it is a very significant fact that the Commission did not advocate the creation of any such distinction in the cases of the remaining superior services (*e.g.*, the Accounts, Traffic, Entrance, etc.) which were also partially recruited in India, but in which recruitment was by nomination and not by competition open to all.

(9) It is contended, therefore, that the Commission failed to appreciate the true position in connection with the Engineer Establishment of the Public Works Department recruited in India and that their recommendations which suggested an awkward and glaringly unjust method of remedying an alleged evil (viz., the inferiority of Indian trained Engineers) were wholly unsound.

(10) To pass on to the second issue, viz., whether it was justifiable to give effect to the Commission's recommendations. The answer is most emphatically in the negative for two reasons.

(11) *Reason* (*i*) *The Government of India Act of* 1833 *and the Queen's Proclamation of* 1858.—By clause 87 of the said Act it is provided that "no person by reason of his *birth, creed* or colour shall be disqualified from holding *any* office in our service." In the despatch of the Board of Directors of the Honourable East India Company which accompanied the Act, it was stated—"It is fitting that this important enactment should be understood in order that its full *spirit* and intention may be transfused through our whole system of administration. You will observe that its object is not to ascertain qualification but to remove disqualification.....Fitness is henceforth to be the criterion of eligibility." Again the Queen's Proclamation, which is widely known and which it is therefore unnecessary to quote, was couched in very similar terms. The above statute and proclamation have been widely regarded as a charter removing all bars to any branch of the Public Service and holding out the promise of increased and higher employment of natives of India (which term includes Statutory natives) and the complaint that this promise has not been fulfilled has been widespread and uninterrupted.

When the case of the Indian Engineering Colleges is examined, however, the position becomes worse, because here, by the creation of the Provincial Engineer Service, the public in India entering these institutions were in fact dispossessed of that which they had had for nearly half a century. Whatever may be the construction put on this said Act of 1833 and the Royal Proclamation as to the grant of facilities for admission to the Public Service not already enjoyed it is contended that these pronouncements at any rate barred the institution of the Provincial Engineer Service and the withdrawal from the alumni of Indian Colleges of that which they had possessed for a long period of time, viz., full equality with their contemporaries from England. The introduction of the Provincial Engineer Service reversed the practice of years, thereby disturbing vested rights which had accrued to the public in India, and suddenly established a system by which place of recruitment alone is the criterion of eligibility for the Imperial Branch of the Public Works Department.

It may be argued that the Indian Engineering Colleges were disqualified from receiving appointments in the Imperial Service by reason of the finding of the Public Service Commission that recruits trained in them were inferior to Engineers obtained from England. In reply it is contended that—

(*a*) the findings of the Commission, as argued in paragraph 6 above, cannot be upheld;

(*b*) the Government of India have virtually acknowledged that Indian trained Engineers are qualified for the Imperial Service (*vide* the arguments connected with the case of Temporary Engineers, paragraph 13 below). If out-classed people from Rurki College, who in addition were only eligible for the Provincial Service, are held to be fitted for the Imperial Service, the pick of the Indian Colleges cannot be defeated;

(*c*) even admitting its existence this disqualification based upon the findings of the Public Service Commission was capable of being removed and should have been immediately removed; and

(*d*) in any case it has since been removed, *vide* the public admissions of eminent persons quoted in paragraph 23 (*b*) below. The Indian Engineering Institutions should therefore be restored to the position they occupied before.

(12) *Reason* (*ii*) *Pledge given to Indian Colleges in* 1873.—Again the institution of the Provincial Service for Indian College Engineers was in direct opposition to a definite pledge given to them in a speech delivered by Sir William Muir, Lieutenant-Governor of North-Western Provinces at Rurki on the 28th November 1873, of which the following is an extract—". . . But apart from personal associations, there is a reason which renders the present moment one of public interest; the establishment in England of an Engineering College for India has unsettled the minds of the public here as to the prospects of this Institution and the continuance to it of the patronage of Government. It has been a subject of much anxiety to myself and of correspondence with the Government of India. It is, therefore, with sincere satisfaction that I am able to announce to you and through you to those without who are interested in the Thomason College, that the Institution at Cooper's Hill *will in no degree affect the relations of the Government of India with this College, nor the employment which has been hitherto guaranteed to its more successful* students. Between the two seminaries there will be no opposition or antagonism. The requirements of this great country are ample for both. I am sure that you will all, with me, be thankful to the Governor-General in Council for the justice which has thus been rendered to Rurki College." The pledge was given shortly after the institution of Cooper's Hill College at a time when the public in India were naturally apprehensive that the position of the Alumni of the Indian Engineering Colleges in the Public Works Department would be injuriously affected, and it will be observed that it was given with the full authority of the Government of India and possibly also of the Secretary of State. It will further be noticed that the Government pledged that the Institution of Cooper's Hill would in *no degree* affect its relations with Rurki College, nor the appointments "*hitherto guaranteed*" to its successful students. The appointments "*hitherto guaranteed*" were in the Imperial Service. Yet notwithstanding this pledge the Provincial Engineer Service making a great distinction between Engineers recruited in England and India was introduced 20 years later and was based to a great extent on a comparison of the respective merits of Cooper's Hill and Indian trained Engineers. Again, it must be noted that this pledge which is recorded in the Rurki College Calendar of 1872-73 formed one of the strongest inducements to candidates to enter Rurki College, for these men naturaly believed (and it was a legitimate belief for them to nourish) that the distinction created was merely a tentative measure, and that when the organization of the Engineer establishment came to be reconsidered, in accordance to para. 10 of the Resolution No. 2523-G. of 1893, the said distinction would be abolished.

(13) *Case of certain Temporary Engineers.*—It now remains to examine whether the recommendations of the Commission have been consistently followed, and whether the subsequent actions of the Government indicate an unqualified approval and acceptance of those recommendations. Here again the answer is emphatically in the negative. The arguments in this connection refer to the case of 12 Temporary Engineers, all Rurki men, who, many years after the Provincial Engineer Service had been established by the Resolution No. 2112-G. of 1892, were made permanent and placed not in the Provincial but in the Imperial Service. The question is why?

The deep significance of this will be more readily and forcibly recognised when the following facts are digested:—

(i) These officers had, with one single exception, passed out of Rurki College after the Commission had

discovered that this Institution did not afford a training equal to that obtained in England.

(ii) They had failed to secure guaranteed appointments when competing for them and had consequently no claim (except good service rendered, which applies equally to other Indian trained Engineers) to this special treatment.

(iii) The majority of them had failed to secure the necessary percentage of marks (*viz.*, 66 per cent.) required in order to qualify for Government appointment appointments and were therefore not eligible under the rules of the Institution which trained them, for permanent appointments at all. *That is to say they could not, with the percentage of marks obtained by them, have obtained guaranteed appointments even if they had in fact headed the examination lists in their respective years.*

(iv) Three of these officers, *viz.*, Messrs. W. C. Cooper, C. H. A. Muller and E. S. Christe *were specially barred from being appointed to the Imperial Service* under para. 11 *of the Resolution No.* 2112-G. *of* 1892, because they were actually undergoing training in Rurki College on the date of the said Resolution and failed to secure guaranteed appointments allotted by Resolution No. 1443-G. of 1884. In their case therefore the Provincial Engineer Service took effect from the 19th July 1892. That is to say even ignoring the disqualification stated in (iii) above they were only eligible for the Provincial Service.

(v) In one case (the name can be stated if required) the officer failed to qualify absolutely in Rurki College and took up an appointment in the service of the State as a Temporary Sub-overseer on the R.M. Railway. He was subsequently engaged in a subordinate capacity as a Temporary Sub-engineer in the Panjab and later appointed as a Temporary Engineer, from whence he was translated to the Imperial Engineer Service. This is therefore a case where an unqualified person has risen from the lowest rung of the ladder to the Imperial Service, long after the Provincial Engineer Service was established, and this should be contrasted with the treatment accorded to the pick of the Indian Colleges against whom the door to similar advancement is absolutely banged and barred.

(14) It is irresistibly clear that—

(i) the placing of these officers in the Imperial Service was a distinct departure from the policy advocated by the Public Service Commission and in fact amounts to a reversal of that policy;

(ii) it stands revealed that the Government have virtually admitted, that Engineers trained in India even subsequent to the Commission's findings, are not necessarily inferior to men recruited in England, and that they are fully qualified to be placed on an equality with the latter, *i.e.*, in the Imperial Service. If this applies to men who were out-classed in Rurki College it must likewise apply with greater force to others who, as stated above, are the pick of the Indian Colleges, but who are placed in the Provincial Service;

(iii) the action taken in respect to the three officers mentioned above whose appointment to the Imperial Service was barred by virtue of Resolution No. 2112-G. of 1892 must be held to have been due to an authorised relaxation of the rules laid down in the said Resolution, and constitutes in fact an amendment of the said rules and renders other Indian trained Engineers also eligible for the Imperial Service, and it is further contended that jpstice and equity demand that these latter should be similarly treated.

(15) *Other Superior Services*, e.g., *the Accounts, Finance, Traffic and Police (until recently).* The facts in connection with these Services are specially worthy of attention for they serve both to emphasise the injustice of the Provincial Engineer Service and to dispel the erroneous belief "*that it is the general rule that members of the Public Service recruited in India are on a different footing as regards pay, leave and pension rules to officers obtained from England.*" This, be it noted, was the reason, given by the Secretary of State, for not re-opening the Imperial Service to Indian trained Engineers in the House of Commons in reply to a question asked by Mr. T. Hart Davies in May 1908, enquiring whether the subject of re-opening the Imperial Service to Indian College Engineers would be considered. The services are, like the Public Works Department, partially recruited in India, but such Indian recruits are on a full equality with their English contemporaries and secure vastly better terms of service than those granted to the alumni of the Indian Engineering Institutions. The questions which immediately present themselves are (*a*) why were not Provincial Branches introduced for these services also?; and (*b*) why was the Indian recruited element of the Public Works Department alone singled out for degradations?

It is a fact that of all the Branches of the Public Service in which the Indian recruited and Imported elements were on an equal footing the Public Works Department only was disturbed and split up into Imperial and Provincial Services. It is contended that the introduction of this invidious and unjust distinction between British subjects born, domiciled, educated and recruited in India is indefensible. Further, in view of the fact that Indian trained Engineers win their appointments by free and open competition and not by nomination (which is frequently secured by influence) and that they can claim to possess superior educational qualifications to those required of men entering these other services, this state of affairs is significant and startling. For example, the educational test requird for admission into the Accounts and Traffic Departments is on a par with that required *merely to enter* the Indian Engineering Colleges, while the Engineer has a further Superior, General and Professional educational course of 3 to 4 years in College itself, and also a further professional training of one year after completing his College course.

It is manifest therefore—

(*a*) that the above facts reveal that it is not the general rule that members of the Public Services recruited in India are on a different footing to officers of their services obtained from England, but

(*b*) that on the contrary where officers recruited in both countries are recruited for and required to do the same work and have the same responsibilities, as in the case of the above-mentioned services, it is the general rule *that they are on the same footing*, and

(*c*) that of all the Branches of the Public Service in which Indian trained and English recruits were formerly on the same footing, the position of the Alumni of the Indian Engineering Colleges has alone been disturbed.

It is therefore contended—

(i) that the *ground, stated in reply to the question asked in the House of Commons*, for not re-opening the Imperial Service to Indian College Engineers disappears; and

(ii) that they should in consequence be restored to their former position.

POSITION OF INDIAN COLLEGE ENGINEERS CONTRASTED WITH THAT OF ENGINEERS FROM ENGLAND.

Position prior to 1908.

(16) The above arguments deal with the policy involved in the creation of the Provincial Engineer Service. It now remains to examine the conditions imposed upon the public seeking admission to the Public Service through the Indian Engineering Colleges and to contrast them with those offered to Engineers obtained from England. Although both these classes were and are still *recruited for and required to do the same work and bear the same responsibilities*, the position occupied by the Alumni of Indian Colleges prior to 1908 was as follows:—

(i) The Indian College Engineer received in 30 years Rs. 116,530 (amounting at 4 per cent. compound interest to Rs. 176,800) less pay than his Imperial contemporary.

(ii) The pay of the Provincial Executive Engineer, 3rd grade, in charge of a Division was actually much less than that granted to an Imperial Assistant Engineer, 1st grade, in charge of a Sub-division involving inferior work and far less responsibility. As a result, instances frequently occurred in which Provincial Engineers received less pay than their own subordinates.

(iii) The position of Provincial Engineers on their attaining the administrative rank of Superintending Engineer was still more glaring. Promotions to these

appointments are, under rule, made by special selection only, so that a Provincial Engineer so promoted would necessarily be selected in preference to other Executive Engineers whether Imperial or Provincial. Undr the scale of pay fixed, a Provincial Engineer on receiving such promotion would not only have received approximately Rs. 67,000 less pay during his former service than other Imperial officers who by the very fact of his selection were confessedly inferior to him but he would even then *qua*-Superintending Engineer receive just half the pay of an Imperial officer holding the same appointment and also less than Imperial officers whom he had superseded and who would be his immediate subordinates.

(iv) In the matter of special allowances, which are given solely on account of extra expense involved in living in some localities, Provincial Engineers were and are still granted only two-thirds of the sum allowed to Imperial officers.

In certain cases moreover (*vide* Appendix 19, P.W. Code) the allowances granted to Provincial officers from Superintending Engineer downwards are less than those granted to Sub-Engineers (subordinates). These glaring and unjust anomalies speak for themselves. They handicapped the Indian College recruit in every possible way.

(17) A general memorial setting forth these grievances and praying for the restoration of the Alumni of Indian Engineering Colleges to the Imperial Service was accordingly submitted to the Viceroy in 1902, that is, when the Provincial Service had been in force 7 years and when the consideration of the organisation of the Engineer Establishment of the Public Works Department was due in accordance with para. 10 of the Resolution No. 2523 G., dated the 25th September, 1893. The reply given was a direct refusal on the ground that the memorialists accepted employment well knowing "*the terms of service.*" This reply may here be suitably contrasted with the attitude displayed towards the imported elements of the Public Works Department who have met with no resistance in their demands to secure accelerated promotion and increased rate of pay which, be it known, is very greatly in excess of that which they contracted to receive and who are at the present moment clamouring for largely improved pensions to which they are distinctly not entitled under "*the terms of their service.*"

(18) The matter was then appealed to the Secretary of State by means of a general memorial submitted in December, 1906.

Changes of 1908.

(19) The next thing that transpired was the memorable reorganization scheme of 1908 (*vide* Resolution No. 675-694 E., dated 24th April, 1908) which made the position of the Alumni of the Indian Colleges worse. Indian College Engineers were also then informed that the orders of the Secretary of State on their memorial of 1906 were embodied in the said reorganization scheme. It would be no exaggeration to say that the feeling raised by this retrograde measure was one of utter consternation and despair which deepened into bitter and intense resentment on the issue, shortly after, of the Government of India's letter No. 997 E., dated the 6th June, 1908, laying down the treatment to be accorded to Indian College Engineers who declined to accept the new conditions of service.

Briefly the changes introduced in 1908 were—

(i) Provincial Engineers were removed from the same list as Imperial officers, thus making a complete differentiation between the two classes.

(ii) The promotion of Imperial officers was accelerated while that of Provincial Engineers was retarded by several years, thus creating the position by which Indian College men would, through no fault of their own and wholly irrespective of the true relative merits be compelled to serve under Imperial men who were their juniors and who may have been previously their own subordinates.

(iii) Promotion to the administrative grades, *i.e.*, to Superintending Engineers and upwards was made almost *physically* impossible for Indian College Engineers.

(iv) The whole reorganisation was transparently designed to subordinate the Indian recruited element of the Public Works Department to the element obtained from England and to place the former in exactly the same relation to the latter as members of other Provincial services bear to the Imperial Officers of their services.

(v) As compensation for these changes which shattered their position and prospects and ensured the complete domination of the imported staff in the Public Works Department a slight increase of pay was offered to Indian College Engineers. This increase when contrasted with the substantial increase granted to Imperial officers is striking. For example, (i) In the first 8 years of service the increase granted to Provincial Engineers averaged Rs. 3 per mensem while that of Imperial officers averaged Rs. 88 per mensem, and (ii) In the first 15 years of service the average increase for Provincial Engineers was Rs. 29 per mensem while that of Imperial Engineers averaged Rs. 142 per mensem. And this notwithstanding the fact (the point requires and will bear repetition) that *both classes of officers are recruited for and required to do the same work and bear the same responsibilities.*

(20) It is small wonder that this reorganisation scheme was rejected by the vast majority of Indian College Engineers, but they were destined to receive an even greater and more staggering blow, for it was ruled (*vide* the Government of India's letter No. 997 E., dated the 6th June, 1908, cited above) that—

(i) These officers would receive no increase of pay;

(ii) They would continue to be promoted according to the rules previously in force for Imperial and Provincial men alike and which had been abolished for the Imperial service; and

(iii) Their names would also be removed from the same list as their Imperial contemporaries.

These orders were not only unjust in that they withheld an increase of pay which had (*vide* preamble to Resolution No. 675-694 E., dated 24th April, 1908) only one month previously, been publicly admitted to be necessary for the Engineer establishment of the Public Works Department, but they were also in direct opposition to and constituted a withdrawal of the *primary conditions* under which these officers were induced to accept employment (*vide* Resolution No. 2112 G., and No. 2523 G., dated the 19th July and the 25th September, 1893, respectively). Under these said Resolutions Provincial Engineers entered the service on the expressed conditions—

(i) that except as regards amount of pay, leave and pension there would in all other respects be no distinction between them and Imperial officers, and

(ii) that they were to be borne on the same list and promoted side by side with Imperial Engineers.

It is submitted that this disregard of the paramount and indefeasible rights of these officers and this arbitrary imposition of changed conditions which would not have been accepted in the first instance (*i.e.*, when they entered the service) is unparallelled and constitutes a significant departure from the practice hitherto observed by which the inducements offered to men entering the public service have been regarded as permanent and enduring.

Changes of 1912.

(21) The general and sustained agitation produced by the above treatment is well known. After prolonged reconsideration the Government of India were led to the conclusion that the position taken up in 1908 was untenable and the reorganisation scheme of that year has in consequence been recently reversed, *vide* Resolution No. 439-458 E., dated 15th May, 1912. The position now is exactly as it was previous to 1908, with similar anomalies and defects, *viz.*;—

(i) the minimum pay of Provincial Executive Engineers is much less than the maximum pay of Imperial Assistant Engineers;

(ii) the minimum pay of Provincial Superintending Engineers is less than the maximum pay of Imperial Executive Engineers;

(ii) the same anomalies in connection with local allowances still exist, and

(iv) generally the pay granted to the Provincial element is inadequate and is not commensurate with their work and responsibilities.

The redress granted, however, is accepted as partial and tentative as it has been admitted in replies to questions asked in the House of Commons that the case has not been finally settled and that the question of the restoration of the Alumni of the Indian Engineering Colleges to the Imperial Service has been deferred for consideration by the Royal Commission.

RECAPITULATION.

(22) Various reasons have been advanced above which it is contended establish—

(1) that the policy advocated by the Public Service Commission of creating a Provincial Engineer Service for Indian recruits was unsound;

(2) that its adoption was barred by the Government of India Act of 1833, and the Royal Proclamation of 1858 for it, in fact, dispossessed the public in India of facilities for admission to the higher ranks of the public service on a complete equality with officers obtained from England which they had enjoyed for nearly half a century. It must also be remembered that these Engineering Colleges formed the only source in India of recruitmnt to the public service, on an equality with officers from England, by free competition open to all;

(3) that the inclusion of the Alumni of the Indian Engineering Colleges in the Provincial Engineer Service constituted the breach of a definite pledge and has moreover resulted in the creation of an invidious and unjustifiable distinction between British subjects domiciled, educated and recruited in India as explained in para. 15 above;

(4) that the Government themselves have repeatedly broken away from the policy advocated by the Commission as in the cases of the various Temporary Engineers (*vide* paras. 13 and 14 above);

(5) that the line of action taken in the cases of these Temporary Engineers gives other Indian College Engineers a just and an irresistible claim to like treatment;

(6) that the whole history of the Provincial Engineer Service from its very institution reveals a course of long continued injustice and shows how very little consideration has in fact been bestowed upon it; and

(7) that the only solution of the matter lies in the discontinuance of the present policy and the restoration of the Alumni of the Indian Engineering Colleges to the position they formally occupied, that is to *the Imperial Service.*

CONCLUSION.

(23) Finally it is urged that the policy now in vogue should be abandoned and that Indian trained Engineers should be restored to the Imperial Service on the following additional grounds:—

(*a*) Indian College Engineers have established brilliant records in the past and have in numerous instances held, and are still holding, the highest administrative appointments in the Indian Public Works Department with distinction. These facts have been duly admitted by no less a distinguished Indian authority than Lord Macdonnell who, in an address delivered at Rurki College on the 6th November, 1900, alluded in the highest terms to the instances in which the Alumni of this Institution has established not merely Indian but European reputations. Lord Macdonnell specially instanced the names of Sir W. Wilcocks and Sir W. Garstin of Egyptian fame who received their training at Rurki College;

(*b*) Whatever may have been the condition of the Indian Engineering Colleges at the time the Public Service Commission sat (and this as argued above did not justify the withdrawal from the Public in India of that which they possessed for so long a period of time) the standard of education imparted in these Institutions has since been considerably raised. Rurki College is now admitted to be equal to any similar Institution in Europe. The following is the testimony of persons whose opinions must prevail:—

(i) Lord Macdonnell in his address referred to above spoke of Rurki College in the following terms:—"This College is, I am assured by those competent to speak on the point, now in a position to impart instruction, both theoretical and practical, up to the standard of any similar Institution in Europe."

(ii) Sir J. P. Hewett, Lieutenant-Governor of the United Provinces, in a speech delivered at Rurki College on the 27th October 1909, spoke of this Institution and its Alumni in the following terms:—"Your assurance, Major Atkinson that it is the aim of yourself and your colleagues to keep the education given in the Thomason College *abreast of the best technical education available in the Western World is amply vindicated* by the extremely high standard of education to which the students who are trained here attain. I have had the privilege of working in close conjunction with two of the most distinguished Alumni of the College. I refer to Mr. Goument, now Chief Engineer in the Buildings and Roads Branch of these Provinces, but destined to reach a still more distinguished position in the Public Works Department. I have no hesitation in saying that these officers are excelled by none of their brethren in the department for professional skill, for initiative, or for a correct appreciation of the needs of the country. I have had opportunities of observing the same good qualities developing themselves in some of the younger men educated at this College, and I have no doubt that you and your staff will continue, in the future as in the past to turn out a constant stream of trustworthy Engineers. Your college has recently been described by the Secretary of State as an Institution with a large and illustrious history behind it' and you rightly observe that if it is to maintain its *past pre-eminence*, it must keep abreast of the time and that there must be a continuous advance and constant and expensive improvement." The deep significance of this second utterance, by a Lieutenant-Governor in India, will be forcibly realised when it is remembered that it was uttered when the agitation against the changes of 1908, was at its highest and after Indian College Engineers had utilised the previous utterance of Lord Macdonnell and had held it out to the Secretary of State as conclusive proof that Indian-trained recruits were not inferior to their English contemporaries. It is irresistably clear that Sir John Hewett would not have spoken in these unambiguous terms, thereby presenting the Alumni of the Indian Colleges with another lever upon which to work, had he not been inwardly conscious that Rurki College did in fact turn out men of marked ability.

(iii) There is yet another public admission establishing the fact that Rurki College has nothing to fear from a comparison with any similar Institution in Great Britain. The Honourable Mr. Goument, Secretary to the Government of the United Provinces in a speech at Rurki College on the 14th July 1910, stated:—"I think it may safely be said that this College is now in a position to impart an education, both theoretical and practical, up to a standard which compares very favourably with that of similar Institutions in Europe. The following extract from a note recently recorded *by an expert* in your Visitors' Book bears out this statement. 'I have visited nearly every College of importance in India, but among all of them Rurki College alone appears to me to attain to the standard of a first grade Engineering College, the organisation and equipment are admirable and the arrangements for imparting practical training in Mechanical and Civil Engineering are hardly equalled in any Institution in Great Britain'":

(*c*) it is claimed, therefore, and it is impossible to resist this claim that there is no difference between the professional education imparted in this Institution and that received by the average Engineer recruited in England. On the contrary, it is a fact in some cases that qualifications of Indian College Engineers are superior to those possessed by the latter, *e.g.*, where men who have only passed out of the Upper Subordinate Class at Rurki have proceeded to England and after undergoing a very meagre training for a short period in the elements of Engineering (at the Crystal Palace, for instance) have been appointed by the Secretary of State to the Imperial Service. These cases are well known both to the Government of India and to the Secretary of State;

(*d*) the Indian College Engineer also posseses the great and recognised advantage (on which great stress was laid when the institution of a Military Staff

College in India was advocated) of having received his training in the country in which he has to practice his profession;

(e) that the Public Works Department is purely a professional and scientific service and has no share in the political administration of the country and that therefore the restoration of the alumni of the Indian Colleges to their former position, while gratifying the legitimate claims and aspirations of the domiciled European and Indian communities, without impairing efficiency (for the already high standard of the Indian Colleges could, if necessary, be raised still further) and giving a much needed impetus to higher technical education to which so much attention is being rightly devoted, would in no degree imperil British supremacy; and

(*f*) lastly the present policy is one which needlessly and unjustly enforces a distinction between two classes which is strongly and increasingly resented, and is in fact opposed to the highest principles of liberal statesmanship which to use the words of the present Prime Minister in his memorable speech at Birmingham in September 1909, aims at "removing the domination of unjust monopoly and opening everywhere the gate to intelligence, to merit, and to energy."

RAI BAHADUR LALA BAIJ NATH called and examined.

71,710. (*The Chairman.*) The witness said there were 125 active members in his Association, all Provincial Engineers. They were all officers trained in Indian Colleges, and recruited to the Permanent Engineer Establishment of the Public Works and Railway Departments. The written statement contained a series of arguments in favour of the abolition of the present division into Imperial and Provincial Branches, and the creation of a superior service which would be recruited by open competition in England and India. It was suggested that in that Service officers should be employed under uniform conditions, as regards pay, leave and pensions, the argument being that officers at present in the two Services were employed on the same work.

71,711. The witness had had 16 years' experience in the Service, and had occupied the position of Executive Engineer in charge of important divisions since 1905. He had also served two years in Assam, the rest of his service being in the Punjab Irrigation, except for six months spent on the contruction works of the Delhi Durbar of 1903. The witness's recommendation that 50 per cent. of the superior Service should be recruited in India and 50 per cent. in England for the present was put forward with the view of making the change a gradual one. At present the recruitment in India was even less than 30 per cent. and this percentage included a certain number of promoted subordinates. His colleagues believed there was sufficient material available in India to raise the percentage to 50. The witness would not retain the present system under which 10 per cent. of the vacancies filled in England were reserved to Indians, but would have free and open competition for half the posts in both countries. When he said that 50 per cent. of the superior appointments should be recruited in India, he did not mean that 50 per cent. of the recruits should be Indians, but that 50 per cent. of the appointments should go to men trained in India, Europeans being allowed to come to India and compete.

71,712. The witness's Association condemned the present system of appointing two probationers for one guaranteed appointment, and suggested that the posts should be given to the top men on the list as used to be the practice. The witness would like to see the system, under which he was apprenticed, revived, namely, that a man, if he proved himself unsatisfactory by the end of his third year of work, could be discharged. Such a proposal would give Government a free hand to deal with a very bad bargain, and it would do away with the anomaly which at present existed, that a man first on the list should be rejected in favour of the tenth man.

71,713. He did not agree with the view put forward by some witnesses that for recruitment to the Imperial Service from India it was necessary to have one very highly equipped College, and that the recruits to the Imperial Service should be drawn exclusively from Thomason College at Rurki, whilst the other Colleges should provide training for the subordinate Service only. He preferred to keep up all four Colleges, and would apportion appointments to those four Colleges in the ratio of the strength of the cadre in each Province.

71,714. In reply to a question whether economy would result from the inauguration of one Central College in India, the witness said that in order to provide a satisfactory and sufficient training at one Central College, a large sum of money would have to be expended on further equipment, and that that amount could be spent more advantageously in improving the other Colleges, if any improvement was required.

71,715. With regard to the witness's proposal for an open competition he would prefer to have an open competition in which graduates from all four Colleges could be tested. He would allocate a certain number of vacancies to each College in proportion to the particular requirements of the Province. He agreed that that would be a modified form of competition.

71,716. With reference to the upper subordinate Service the witness said he would place no bar in the way of the best men being promoted to the superior service. He thought there were a number of men in the upper subordinate Service who were qualified to occupy superior posts. He agreed with the view expressed by other witnesses that the personnel of the upper subordinate Service stood in need of great improvement. One thing which would bring about that improvement, he thought, would be the raising of the status and pay.

71,717. The witness said he had no objection to Royal Engineer officers entering the Irrigation Branch of the Department, but he thought they should come in at their proper place, and in the early years of their service, so as not to cause any supersessions.

71,718. The witness suggested the creation, alongside the permanent pensionable service, of a permanent non-pensionable service, to deal with the Temporary Engineer problem. He could not evolve any scheme by which the 200 odd Temporary Engineers could be done away with all at once. For all practical purposes Temporary Engineers were permanent officers. He agreed that if Temporary Engineers were employed on permanent work and given different conditions from those of officers alongside of them who were holding similar charges, it might lead to grievances after 10 or 20 years, but the present condition of the Temporary Engineers was very bad, and their position very insecure.

71,719. He did not admit that the expenses of the Indian officer were less than those of the European officer, but even if it be assumed for the sake of argument that it was so, the witness would still contend that there should be no difference in the emoluments. He refuted the argument, which was so often advanced, that because an Indian spent less he should receive less. That was not the sole ground on which the Provincial Engineers said they should receive the same salary; they sought it on the principle of the same work the same pay.

71,720. With regard to the objection in the written statement to the designation of "Provincial," the witness objected to the term because it carried with it the present rate of Provincial pay. The sole cause of the discontent among Provincial officers on that point was that they were paid less than the Imperial officers. If Government hereafter laid down a rule that there should be a foreign allowance for Europeans serving in India as distinguished from the salary of the indigenous community, and applied it to all the Services, the witness considered the discontent might be less. He thought there would still

remain a certain amount of discontent if two men doing the same work received different emoluments.

71,721. With regard to the question, whether it would be recognised that imported labour had a different market value from indigenous labour, the witness said he thought that when imported labour was given higher wages than local labour, local labour resented it, and did not do the same willing work which it did previously. Another important point was that imported labour should have its wages compared to the labour of the particular place from which it was imported, and not to the wages of the place whereto it was imported.

71,722. (*Lord Ronaldshay.*) The witness said he had had experience of three or four England-trained men who had served under him as sub-divisional officers, and he could say from personal experience that they generally lacked in knowledge of Indian conditions. That was why he had advocated that in the open competition some Indian subjects should be introduced. He preferred a system of open competition to one of nomination or selection, as the latter might lead to favouritism and other evils.

71,723. With reference to his written statement as to the Government not being justified in creating a Provincial Service because of the Act of 1833, the witness said he meant that a Provincial Service officer was disqualified from holding the offices in the Public Works Department which he held before. A man who passed out of Rurki College went into the Imperial Engineering Service up to the year 1895. He admitted that no Provincial Service officer was theoretically disqualified from holding any office in the Public Works Department, but he considered it practically would come to that when the stage of Chief Engineer or Superintending Engineer would be reached on account of the very large difference in the pay.

71,724. (*Mr. Sly.*) The witness said that Civil Engineers recruited both from Coopers Hill and by the Secretary of State had served under him but he could not choose between the two.

71,725. (*Mr. Chaubal.*) The witness said that he preferred the 50 per cent. to be recruited from England by competitive examination, as selection or nomination sometimes led to a man of inferior attainments getting into the Service and to a man of very superior attainments being rejected. He was not prepared to give any instances but he could mention the case of two Indian boys who had studied in England, one of whom had superior attainments but had been rejected, while a man of comparatively low attainments had been selected.

71,726. With reference to the scale of pay, the witness said the standard of pay for certain work was fixed and no man should be paid on a lower scale. Even if all the scientific and technical departments under Government were manned by none but Indians he would still consider the present pay to be insufficient. He did not feel justified in making any comparison between the pay of the Public Works Department and other Departments, as anything he could say on the subject would be mere surmise.

71,727. (*Mr. Fisher.*) The witness said he was aware that the Secretary of State was unable to nominate a candidate in England for the Public Works Department unless that candidate had satisfied certain preliminary intellectual tests, and those tests were comparatively high, but he did not think that was altogether sufficient to prevent a certain amount of patronage, though he did not say there was any abuse at present.

71,728. (*Mr. Macdonald.*) The witness said the real grievances of the Provincial Service were two, first pay, and secondly the proportion of recruitment in India. When the last Public Service Commission sat the ratio of recruitment in India to that of recruitment in England was 30 to 70, and the Commission recommended that statutory Natives should be encouraged to enter the Department by a reduction of recruitment in England. The reverse, however, had taken place. The rate of recruitment for the last ten years to the Imperial Service, which was of course barred to the Indian-trained Engineer, was 40 a year, whereas only nine Engineers a year were appointed from Indian Colleges. Of late years the Department had expanded greatly and all the additional recruits had come from England. A larger recruitment in India would yield men who were quite as efficient, and he believed the Colleges in India were able to supply the men.

71,729. With reference to pay, the witness said he still maintained that a scale of pay which began at about £200 a year and might rise to £960 a year within a very reasonable period of time was not sufficient for an Engineer in the Public Works Department, because the Engineer officer had to maintain a certain official status. The witness said he had not compared the salaries with the salaries paid in England to men doing similar work and occupying the same status, but he was of opinion that the conditions were quite different in the two countries. If the wages in England for the same work were less, and it was possible to get the very best Engineers, he would still say that the need for high salaries in India was greater than the need for high salaries in England, having regard to the surrounding conditions, because the Indian Services are the best paid in the world.

71,730. (*Mr. Madge.*) With regard to the statement that many Indian trained Engineers possessed better qualifications than some officers recruited in England, the witness said he had had personal experience, but did not wish to quote instances. He had had European, Anglo-Indian, and Indian officers under him and there were not many instances he could quote, though there were some.

71,731. The witness was in favour of increasing the divisional charges not only to provide for men in the Service but also to provide for the expansion of the work. He himself had held a division for six years which he considered should have been divided into two, and he thought there was a number of similar divisions.

71,732. If any of the temporary Engineers were made permanent they could be only made so by adopting the same measures as had been previously adopted. Six or seven years ago a number of them were made permanent and placed on the list according to their relative length of service. That caused a great deal of discontent; but there seemed to be no other way. Some really deserving men had not been made permanent because of the supersessions which resulted and perhaps because the Government of India had ruled that no more men should be taken on the permanent list.

71,733. (*Mr. Abdur Rahim.*) The witness said he thought dissatisfaction began as soon as the men who first came in began to understand the conditions. At first it was more or less a case of hoping against hope. The Provincial Service began to be recruited in 1895 and the first Memorial to the Viceroy was sent up to 1902. There was a proviso in the Resolution creating the Service that after seven years the conditions would be reconsidered and the Service would be reorganised. From 1902 to 1906 no Memorial was sent up, because a reply to the 1902 Memorial was awaited, and to a Memorial of 1906 to the Secretary of State no reply was received till after the reorganisation of 1908 and then came the resultant discontent. The 1892 Resolution creating the Service said, in distinct terms, that there would be no distinction except in leave, pension, or pay. There were only 165 Provincial Engineers in the whole of India, including Railways, and he knew the opinion of practically every one of them, and could assert that they were all dissatisfied with the distinction of pay where there was no distinction in work. He himself had taken over the charge of a Division and held it for six years, former incumbents of which had nearly all risen to be Chief Engineers and one of whom was now Secretary to the Government of India.

71,734. (*Sir Valentine Chirol.*) The witness said he was not of opinion that the remuneration of work could be conditioned solely by the nature of the work

done without considering all the circumstances and conditions under which the work was done. The principle he would apply is that the inducement offered to the recruit should be compared with the emoluments in the place from which he was recruited, and not with the emoluments obtaining in the place for which he was recruited. Paying the Indian recruited Engineer the same rate of pay in no way affected recruitment in England. The dissatisfaction was not due to the fact that Indians recruited in England were paid on the same scale as Europeans. An Indian entering the Finance Department in India received the same pay as an officer who came from Great Britain. It was impossible to expect good work from a man who was discontented with his pay and who was looked down upon by his subordinates. He had had under him an assistant getting 50 per cent. more pay than himself. He did not compare the India-recruited men with the Indian recruited in England but with the Service as a whole.

71,735. (*Sir Murray Hammick.*) If the conditions in the Public Works Department were applied to other Services, the witness thought the other Services would be similarly discontented. The Services that had no distinction in pay were the Traffic Department of the Railways, which was recruited in India as well as in England, the Finance Department, the Posts and Telegraphs, and the Opium. It was true there was a distinction in pay between the Indian Civil Service, and the Provincial Civil Service, but there was also a distinction in work. A man who gained a listed post had been doing inferior work during his whole service and therefore when he reached the listed post he was quite glad. He thought it was an impracticable thing to pay the Indian recruited man at a different rate from the English recruited man and the difficulty would continue, unless a method could be devised whereby all men in the Department obtained what Imperial men already had, and a new Department was created at a lower scale of pay and given less important work; but he did not think that a scheme of this kind came within the limits of practical politics. Any attempt to lower the pay of the Department in future, even though guarding the rights of the men already in the Department, would tend to lower the standard of work and of efficiency. He believed the Government saved about Rs. 50,000 a month on the pay of Provincial Engineers, who if contented would probably save the Government that amount many times over by doing more willing and therefore better work. The case of the officers recruited in India was so strong that nothing except the raising of pay would remove the grievance. Any differential rate in the higher services, even if made generally applicable to all the Departments in India, would cause great dissatisfaction in the Services all over India, and such dissatisfaction would result in uneconomical work, especially in his own Department, which had the spending of large sums of money in its hand and was a large earning Department. In his own division the Revenue earned was about 15 lakhs of rupees a year.

(The witness withdrew.)

LALA RADHIKA NARAYAN, Executive Engineer (Irrigation), Punjab.

*Written Statement relating to the Public Works Department.**

71,736. **(I.) Methods of recruitment.**—Under this head the following points deserve special consideration.

(1) The percentage of recruitment from the Indian Engineering Colleges as compared with that made in England is altogether inadequate, as appears from the following facts and considerations:—

(*a*) At the time of the last Public Service Commission of 1886-87, the Government of India in their Resolution No. $\frac{34}{1573-83}$ dated 4-10-86 declared the object of the appointment of that Commission to be "to devise a scheme which may reasonably be hoped .....to do full justice to the claims of Natives of India to higher and more extensive employment in the Public Service." But the actual result in case of the Public Works Department has been that the percentage of recruitment from the Indian Colleges has decreased from 30† as it was in 1886 to less than 24† as it at present. This retrogade progress made during the last 27 years clearly shows that so far at least as this particular Department is concerned, the above quoted object of the Government of India was not only not fulfilled but it was actually reversed in practice.

(*b*) The Public Service Commission of 1886-87 in formulating their recommendations expressed an opinion that the strength of the Imperial Branch should not be greater than was necessary for purposes of control and direction, and for the execution and repair of works calling for high engineering skill; and that the recruitment from the Coopers Hill Royal Engineering College which appeared excessive at that time, should be regulated accordingly. Now the recruitment from this particular College at that time was 50 per cent. of the whole, the remaining 50 per cent. being composed as follows:—20 per cent. Royal Engineers, and 30 per cent. Indian College Engineers.

If this recommendation of the commission had been acted upon, the recruitment of Civil Engineers in England should have been to-day considerably less than 50 per cent., and that of the Indian College Engineers a good deal more than 30 per cent. Moreover the substantial reduction made in the number of the Royal Engineers transferred to the Public Works Department now-a-days, should have all gone to increase the number of the Indian College Engineers the number of Cooper's Hill men being already excessive. But what has actually happened is exactly the reverse of this. The recruitment of Civil Engineers in England has increased from 50 per cent. to more than 75 per cent., and that of the Indian College Engineers has decreased from 30 per cent. to less than 24 per cent. This means a complete subversion of the recommendation of the last Commission in this connection.

(*c*) The Indian Colleges of Engineering, notably the Rurki College, have during the last quarter of a century or more, made a remarkable and all round progress in improving and bringing up to date their courses of study and their method of training young students in the theory and practice of Civil Engineering. This progress has been so very marked on all sides that the Indian Colleges are now in a position to claim, in the words used in the syllabus of the Rurki College for 1913 that they were able to turn out "Civil Engineers of as high a grade as a College training can produce." In addition to this in these Colleges special attention is naturally paid to "the local conditions of India." The text books give examples with descriptions and other details of the great Engineering works in India, and the whole course of teaching and instruction is designed to make the student familiar with the characteristic features of Indian Engineering. Moreover the Engineers trained in India know and understand the people of the country with whom they have to deal and among whom they have to work much better than the foreigners. Thus it follows that the Indian College Engineers ought to be better fitted for employment in the Public Works Department of this country than those recruited in England, and therefore the percentage of their recruitment should have increased with the increase in the number of qualified Engineers out-

* Mr. Radhika Narayan represented the Engineers' Association, Lahore.

† In arriving at these percentages the number of Upper Subordinates (4 and 5 in alternate years) promoted to the Engineer's grade has not been taken into account. First because this is not recruitment but special promotion in recognition of conspicuously meritorious services rendered by selected subordinates of long standing. Secondly because as a general rule a promoted upper subordinate will rarely, if at all, aspire after rising to a grade higher than that of the Assistant Engineer. Hence this case is altogether different from that of those who are in the very first instance recruited for the Engineer grade. Thirdly because the system of promoting upper subordinates to the grade of Assistant Engineers being of recent origin had not been in vogue in 1886, and for several years after that. Therefore for a correct comparison between the existing state of things with that of 1886 it is necessary to leave them (the promoted upper subordinates) out.

turned from the Indian Engineering Colleges. But actually this has not been the case at all. The percentage of recruitment in India has practically stood where it was in 1886, during the last 27 years, although the number of qualified Engineers outturned by the Rurki College alone has increased by 150 per cent. during the same period.

(*d*) The Cooper's Hill College was abolished in 1907-08, and since then recruitment in England has been made by a Selection Committee from amongst the qualified Civil Engineers outturned by the various Engineering Colleges there. This selection is not based on any competitive examination, and it has been found that several Engineering students who failed to pass the examinations of the Rurki, and in one case of the Poona Engineering College, went to England and after going through a short course of study there, came out successful as Imperial Engineers duly selected by the Secretary of State's Committee of Selection. This clearly shows that the Engineers recruited in England are by no means superior to those recruited in India. Moreover the Government has not been since the abolition of the Cooper's Hill College under any obligation to necessarily recruit any particular percentage of Engineers in England. It was, therefore, naturally expected that the recruitment in India would be substantially increased after the abolition of the Cooper's Hill College. But instead of any such increase a resolution (No. 675-694 E) was issued by the Government of India on the 24th April, 1908, which rendered the prospects of the Indian College Engineers very discouraging and humiliating.

In the light of the above facts and considerations it is, I believe, not too much to say that a very retrograde policy has been followed, up to this time, in the matter of recruiting Indian College Engineers for employment in the Public Works Department of this country, and therefore it can not be too strongly urged that at the present stage the recruitment in India should be increased to 66 per cent. of the total recruitment.

(2) As regards recruitment in England, the present system of appointment by selection is by no means satisfactory. The well recognized method of selection by competition is the best yet devised by man, and there seems to be no reason why it should be abandoned in case of recruitment in England. Another reason why a competitive examination is needed in this case is that the Engineering Colleges of Great Britain can not be expected to train their students specially for Indian Engineering. Therefore the selected passed students of these Colleges are likely to prove deficient in those things which are peculiar to India, and these deficiences can best be removed by selecting the candidates on the basis of a judicious competitive examination in the special features of Indian Engineering and one Indian language. This latter point might be considered by some to be unimportant as the deficiency pointed out above might be considered capable of removal after a short residence in India. But really this view is incorrect, being based on ignorance due to the holders of this view not being in real touch with the Indian people. In fact the deficiency pointed out above is a serious one and is likely to considerably reduce the usefulness of a young Engineer for the first few years of his service.

(3) The next point to be noted in connection with the recruitment of Engineers in England is that no more than 10 per cent. of them can according to the rule in force be Indians. This distinction, based as it is on the race, creed or colour of the candidate, is, I believe, altogether unnecessary and inadvisable. I think it is a wrong policy to accentuate race prejudices by making invidious distinctions of this or any other kind. Both in England and India the door of competition should be equally open to the Indians as well as to the Britishers. No such distinction is made for Indians in case of the Civil Service competition, what is its necessity then in case of Engineers recruited in England? If this necessity lies in the fact that none but the Statutory native of India can compete in the Indian Engineering Colleges, let this restriction also be removed at the same time. There was a time when educated Indians needed special concessions and facilities for taking up the profession of Engineering. Happily that time has long passed away, and the educated Indians are now quite competent to hold their own in a fair competition with all comers. It is indeed in the best interests of the country that the most capable men available should be employed in its public service. If again this necessity is felt on account of an apprehension that Indians, if allowed free access through all doors would swamp the Public Works Department, the following facts and figures taken from a calendar of the Rurki College ought to remove this unfounded apprehension. In the year 1886, five students out of 9 who passed the final examination of the Civil Engineer class were Indians and three of them occupied the first three places. This shows that Indians had by this time begun to take up the Engineering profession in earnest. The Sub-Committee of the last Public Service Commission which was appointed for the Public Works Department had also arrived at this conclusion. Now during the period of nine years that elapsed between 1886 and 1895, the latter being the year in which the provincial service scheme was brought into operation in this Department, both Indians and Europeans joined the Rurki College freely. This was, therefore, a time of fair competition between the two communities, and had Indians been able to greatly outnumber Europeans, this was the period in which they ought to have done so. But in point of fact out of a total number of 101 students who passed out of the Civil Engineer class of the Rurki College during this period, only 40 were Indians and 61 Europeans. When such was the case here in India where the Indian students possessed every facility for fairly competing with their fellow European students, what reasonable apprehension could there possibly be of their swamping the Department if they were allowed to compete on equal terms with the Europeans in far off England.

(4.) As regards recruitment from Indian Colleges the points which deserve consideration are as below:—

(*a*) The new system of sending out two apprentices for every vacancy and selecting only one of the two after a trial of one year for filling that vacancy has been found by experience to be objectionable and unsatisfactory. This system was introduced and enforced in case of the Rurki College only a few years ago. In no other Indian Engineering College this system is in force, and the Rurki College itself had done very well without it for more than 50 years. Therefore the sooner this new system is abolished and the old one restored the better.

(*b*) Prior to 1896 the age limit fixed for entering the Rurki College was 22 years, and no special educational qualifications were required. But in 1896 when the period of training in the Civil Engineer class was extended from two to three years, the age limit was reduced to 21 years; and soon after this came the rule that no *Indian* candidates could be admitted who had not passed the B.A. examination. Now the minimum age limit for passing the Matriculation Examination of the Punjab University is fixed at 15 years, and at least four years are required after this, to pass the B.A. or B.Sc examination. So that even if a student passed the Matriculation examination at the right time, viz., when his age was between 15 and 16, and the B.A. or B.Sc. examination four years later his age by that time would be between 19 and 20. Then he must wait another year before he could go up for the Rurki examination, because the B.A. results are not declared till after this examination is over. In this way he gets only one chance for appearing in and passing the Rurki examination. On the other hand in case of European students desirous of joining the Rurki College the only educational qualification required is the School final or the Matriculation examination of some English school. So that these students can get several chances for appearing in the Rurki entrance examination before they attain the age of 21. In this respect, therefore, the Indian students labour under a great disability; and it is very necessary that this disability which becomes a real hardship in many cases be removed. The easist way to do so would be to lower the educational qualification from B.A. or B.Sc. to F.A. or F.Sc. examination. This was the test prior to 1898 and the undergraduate students who passed out of the

Rurki College before this year have proved to be quite as successful and competent as the graduates who passed before or after 1898.

(c) At present the recruitment of Engineers from the four Indian Engineering Colleges is very unequal. The Rurki College which is the oldest Engineering College in India is the most favoured of all. Engineers trained in this College enjoy the lion's share in recruitment, as 5 or 6 guarantees out of a total of 9 or 10 are reserved for this College in alternate years. The remaining four being distributed among the other three Colleges. If this unequal distribution of the guaranteed appointments among the several Indian Engineering Colleges is due to the fact that the Rurki College is the most advanced and up-to-date of them all, justice requires that these other Colleges should also be brought up to the same standard of efficiency as the Rurki College. Anyhow, this circumstance which is beyond the control of the students entering these Colleges, should not be considered sufficient to deprive them of their proper share of the appointments in the public service of their country. It is therefore recommended that while increasing the percentage of recruitment from the Indian Colleges, the guaranteed posts be divided among them proportionately to their respective shares.

(5.) In addition to the two permanent services whose recruitment has been criticized and commented upon above, there is the Temporary Service which came into existence about the year 1890, and went on increasing in magnitude from year to year, so that at present its strength in India is not less than 165 men which is almost equal to the total number of Provincial Engineers. Of these 165 Temporary Engineers the largest number, 63, belongs to the Punjab, and of these no less than 57 belong to the Irrigation Branch of the Public Works Department, and of these latter no less than 34 have rendered services ranging from five to twenty years. All this clearly shows that these temporary engineers are not and have never been temporary in the proper sense of the word. In fact in actual practice they have been doing the same or similar work side by side with the permanent Engineers. They have held charges of subdivisions and divisions continuously for years, exactly in the same way as the permanent Engineers have done, and the same kind of work and responsibility has been expected from them as from the permanent Engineers. And yet we find that the modes of recruitment of the two services have been entirely different. The power of recruiting the Temporary Engineers has hitherto rested entirely with the Local Government which practically means with the Chief Engineer; and since no definite and clear rules were ever framed for the regulation of this peculiar kind of recruitment, all sorts of anomalies are to be found in it. Persons possessing engineering qualifications of various degrees and kinds, and even persons possessing no engineering qualifications at all at the time of recruitment, have found their way in the Department as Temporary Engineers. This state of things is evidently unsatisfactory. It is, therefore, recommended that either the recruitment of Temporary Engineers be stopped altogether; or if it be found impracticable to do so, it should be placed on some regular and systematic basis. The following suggestions are made in this connection:—

(a) Temporary Engineers should always be recruited from amongst the trained and qualified Engineers or students of some recognized Engineering College. As the number of qualified students coming out of an Engineering College must always be considerably in excess of the students who secure guaranteed appointments, such certificated students or qualified engineers can always be had for employment as temporary engineers. Hence there seems to be no justification at all for employing unqualified persons in this capacity. No one would ever think of employing an uncertificated man as a permanent Engineer. Why then should there be any relaxation of this essential principle in the case of Temporary Engineers, who are always required to perform the same kind of work and to bear the same responsibilities as the permanent Engineers.

(b) The Temporary Engineers should always be employed for some specific work and for some specified period of time not exceeding three years. There seems to be no justification for doing otherwise. A temporary Engineer should not only be temporary in the matter of his pay, prospects and conditions of service, but in actual practice also. We ought to adhere much more to the spirit than to the wording of the regulations on this subject. The spirit of the articles 77, 79 and 80 of the Civil Service Regulations is distinctly against the continuous employment of temporary Engineers for indefinite periods of time, as temporary Engineers.

(c) If the Government finds it in the best interest of the Public Service not to dispense with the services of any temporary engineer after the particular period of time for which he was employed is over, he should be made permanent; and his name placed at the bottom of the list of permanent Engineers already in service, along with the new permanent Engineers recruited during the year from other sources. In fact these temporary Engineers should be recognized as one of the legitimate sources of recruitment for permanent Engineers, and a certain suitable percentage of the total recruitment should be assigned to this source. It often happens that an otherwise capable student fails to distinguish himself in his College career on account of some chance circumstance or of some minor defect or short-coming which could be easily removed or counterbalanced by experience and knowledge of the world. It is clearly very hard for such men to be barred for ever from a permanent place in the public service for such trifling and unimportant disqualifications as the above. In fact a number of temporary Engineers have been made permanent in the past, and the experiment succeeded on the whole. In addition to this, it is not just and fair that the Government should go on retaining the services of the temporary Engineers from year to year for deriving the full benefit of their experience and ability so long as it stands in need of it, and that it should turn them out at a month's notice when their services are no longer required. Such a one-sided system of dealing with this important body of public servants is not only bad for the temporary engineers but is also indirectly harmful to the best interests of the Government. Hence the necessity of making the temporary Engineers permanent, under the circumstances mentioned above.

71,737. **(II.) System of training and probation.**—The following points deserve special consideration under this head:—

(1) Sufficient attention is not, in my opinion, being paid at present to the training of the young engineers whether recruited in England or in India. Those recruited in England do not pass through any probationary period at all for training, after their arrival in India, although they stand in much greater need of practical training than the Indian College Engineers; while those who are recruited in India do not get such training as they ought to get during their one year's period of probation. Sometimes it happens that the young engineers are placed for training under Executive Engineers who have no inclination or time for attending to this difficult piece of work properly. At other times, the conditions under which the young engineers are placed are not the most suited for giving them a good and adequate training. Moreover no definite arrangements exist at present for enabling the probationers to get a thorough grounding in the various kinds of practical work which they would soon be required to do and look after in the proper discharge of their duties as engineers. The result of all this is that the first few years of service of an engineer are not spent as usefully as they ought to be spent, and experience which could be acquired very easily under proper guidance is afterwards gained slowly and after making many unnecessary mistakes. Moreover many erroneous ideas and conceptions about men and things are formed and perpetuated merely through ignorance and want of experience. This is naturally much more the case with the engineers recruited in England than with Indian College Engineers, because the former labour under the great disadvantage of not knowing the language and the people of this country. For remedying this unsatisfactory state of things it is suggested that the

training of all the young Engineers (recruited from whatever source) should be placed on a regular and systematic basis, and that the period of training should be sufficiently long.

(2.) It is further suggested that so far as possible European Engineers should be placed for training under some specially selected experienced and capable Indian Executive Engineer, whilst the Indian Engineers should be placed under some similarly selected European Executive Engineer. This suggestion is quite natural. It provides for the best means of removing and rectifying the characteristic shortcomings and defects of both the Indian and European recruits and is calculated to produce the best results through a combination of the virtues and excellencies of both the races. Moreover this arrangement would be very suitable for enabling the young European engineer to learn the language and to become familiar with the people much more easily than otherwise.

(3.) Lastly too much stress can not be laid on the necessity of making the young engineer learn to sympathise with and know the people among whom he has to live and work, and to be in real touch with them. This is an essential qualification for all Government servants, and it is especially so for the engineer, who is required in the proper performance of his duties, not only to deal efficiently with the forces and materials of nature, but also to negotiate successfully with the various kinds and classes of people with whom he comes in contact. In no other civilized country of this world a public servant can be expected to administer the people under him efficiently and successfully without knowing all about their habits, manners, customs, wants and grievances &c. But here in India there is a tendency to consider this important qualification of a public servant of a minor or secondary importance. This is obviously a mistake. It is, therefore, recommended that the Executive Engineers selected for training the probationers placed under them should be such as are able to inspire the young engineers with a spirit of true and abiding sympathy with the people, and to remove from their minds such prejudices, false notions and antipathies as are generally formed by young and inexperienced engineers (especially Europeans) on the basis of mere hearsay or the garbled versions of interested parties.

(4.) It is a matter of daily experience that unless an officer takes very great care, and tries to find out the truth for himself, he is very much liable to form altogether erroneous ideas and come to very wrong conclusions in judging his subordinates and other people, and in arriving at decisions for and against them. Raw young men in particular, are especially apt to jump to hasty conclusions and to act on the impulse of the moment, and if they are allowed to go on unchecked in this wrong course, the tendency for doing such ill-considered things increases, and the habits and temper of the young Engineer are altogether spoilt. Hence it is of the very first importance that the young recruits should get from the Executive Engineer selected for their training a very sound lesson about this important matter in the very beginning of their career. The account given by Mr. Fielding Hall in his article on "Competition-wallah" in the Fortnightly Review for February, 1913, of a young Civilian and his perverted notions about the Burmans is a case in point, as it very correctly represents the state of things prevailing in the Public Works Department, Punjab. The existence of this evil is fully recognized by the Indian Engineers who are in touch with the people; but most of the European Engineers seem to be unconscious about it probably on account of their necessarily circumscribed vision and more or less one-sided view of things. In any case there can be no doubt that it is of very great importance to provide against the formation and perpetuation of wrong notions of any kind about the people in the minds of the young Engineers, and the best way of ensuring this is to give them a very correct and sound training in this important matter also during their period of probation.

(5.) Another matter in connection with which necessity for sound training in the very beginning of an Engineer's career is essential, is the method of dealing with his subordinates and office establishment both clerical and menial. Owing to various causes and chiefly due to the general-ignorance of the European Engineer of the language of the people and of many other things connected with them a certain class of subordinates has arisen who, being led by the strong attraction of greed of money and power, have taken to the ignoble vocation of systematically imposing upon and deceiving their more or less ignorant and in many case young and inexperienced officers about a good many official matters. This class consists of a body of unscrupulous, designing and clever men who have by long practice become quite expert in their illegal trade, and it is a matter of common knowledge among the Indian people that unless the Engineer in charge of a Subdivision or Division is particularly wide awake and both capable of and willing to look into matters and to find out the truth for himself, any one who wants a grievance redressed or a request granted must needs go to members of this disreputable community and propitiate them as best he can, before he can hope to gain his object. The men of this class are thus not only a great hindrance in the way of dispensing equitable justice to all both high and low, rich and poor, strong and weak; but are also responsible for having contributed very largely towards lowering the reputation of educated Indians in the eyes of their European superiors who are in many cases unable to distinguish the grain from the chaff, and judge all educated Indians indiscriminately from their experience of a few. It is, therefore, of the utmost importance that the young Engineer should be warned against the machinations of this mischievous body of men and be practically trained to distinguish such men from others and to deal with them properly.

71,738. **(III.) Conditions of service.**—(1.) On the basis of the one-sided evidence of many European witnesses the last Public Service Commission of 1886–87 came to the following conclusions bearing upon the conditions of service of the Engineer establishment of the Public Works Department:—"Some of the operations of that (the Public Works) Department require the highest Engineering skill and training obtainable in England, and for the control and direction of a great Department, the annual expenditure of which is reckoned by millions, qualifications are wanted which are not at present readily attainable in this country. On the other hand much of the work falls to the Engineering establishment is such as may be and is performed efficiently by officers who have received their professional education in India . . . Men recruited in India, once in the Department, are paid at the rates considered necessary for men who have received a superior general and professional education in England, and these last find themselves for many years condemned to labour on works within the capacity of men of an inferior standard of education. . . . The evidence before the commission leaves no ground for doubting that the officers recruited in England receive at Woolwich, Chatham, and Cooper's Hill a professional education of a higher kind than that which the best Indian Engineering Colleges are capable of affording, and that their general training and education are superior to any attainable in India, but it is abundantly evident that at least one of the Indian Engineering Colleges can, and does impart such a professional education as is fully adequate for the ordinary work of the Department, and that these Colleges can be made still more efficient for this purpose."

(2.) The views expressed by the Commission in the above quotations clearly show that the reason why the conditions of service and salary &c. were recommended to be different for the Indian College Engineers on the one hand, and the Engineers recruited in England on the other, was that the latter were regarded by the Commission to be decidedly superior to the former in merit and Engineering qualifications. There is no other reason given for this differentiation anywhere in the report of the Commission except of course the general one of analogy with the Provincial service of the Civil Department. This is an important point to note. Now on the basis of the recommendations made by the last Public Ser-

vice Commission the Provincial Engineer service of 1892 was instituted and in Resolution No. 2112 C., dated 19/7/1892, of the Government of India introducing this new service for the first time it is clearly laid down that excepting conditions of pay, leave, and pension, " in all other respects there shall be no distinction between the members of this service, and those of the Imperial Service." This means that although the Government of India adopted the recommendation of the Commission regarding reduction in pay of the Provincial Engineers, who were all to be recruited in India, it took no action on the suggestion of differentiating between the work and responsibilities of the two classes of Engineers, the Imperial and the Provincial, in spite of the fact that the only reason explicitly given by the Commission for reduction in pay was this said differentiation. This was a clear anomaly and it was duly pointed out by the Provincial Engineers in the memorials which they submitted after the trial period of seven years of this new experiment was over. Since reduction made in pay was on the face of it unwarranted, the protests of the Provincial Engineers against it were naturally persistent and emphatic. To begin with little or no attention was paid to the memorials of protest for several years. Then in 1908 a clever scheme was devised seemingly at least with a view to hoodwink the Provincial Engineers. The rate of pay was increased fairly substantially but at the same time the status of the Provincial Engineers was considerably lowered, and in doing this an attempt was apparently made to introduce that differentiaion in the work and responsibilities of the two classes of Engineers which was left out altogether in the reorganisation scheme of 1892. According to this new organisation scheme of 1908 which was enunciated in Resolution No. 675-694 F., dated 24/4/1908, of the Government of India the lists of the Imperial and Provincial Engineers were separated, and the conditions of service of the two services were arranged in such a way as to keep the Provincial Engineers almost always subordinate to the Imperial Engineers. However this new clever scheme did not succeed at all. By far the greater majority of the Provincial Engineers did not accept these new conditions of service in preference to the old ones in spite of the substantial increase in pay, and their protest against the Provincial service itself became much stronger than before. The agitation raised by the Provincial Engineers against the reorganisation scheme of 1908 in particular and the whole Provincial Engineer scheme in general grew stronger and stronger every day, till at last the Government of India recognized the justness of their complaints to a certain extent at least and issued a resolution No. 439-458 E., on the 15th May, 1912, according to which the increase in pay provided in the resolution of 1908 was allowed to stand and at the same time the invidious distinctions introduced in that year in the conditions of service of the Provincial Engineers were all removed, so that at present the conditions of service of both the Imperial and the Provincial Engineers are the same, but differentiation is made in the rates of pay and allowances and in the leave and pension rules. Although this partial concession to the just claims of the Provincial Engineers has been entirely in the right direction, yet since by making the conditions of service the same for both the classes of Engineers it is virtually admitted that both the Imperial and Provincial Engineers are of equal merit and qualifications, the only definite ground on the basis of which a reduction in the pay of the Provincial Engineers was recommended by the last Public Service Commission is entirely taken away, and the present differentiation in pay between the two classes of Engineers remains without any justification at all. This is an anomaly which should, in my opinion, be removed as soon as possible.

(3.) As regards the conditions of service of the Temporary Engineers, they are, in my opinion, very unsatisfactory. As explained in paragraph 71,736 (5) above most of the Temporary Engineers at present in service are, in so far as their work and responsibilities are concerned, virtually in the same position as the Permanent Engineers, but their conditions of service are altogether different. Although many of them have been in service continuously for the last five, ten, fifteen, or even more than fifteen years, yet their appointment is sanctioned only for one year at a time. Thus their services are liable to terminate at any time when the usual yearly sanction is either not applied for or not given. Moreover their services might be dispensed with at any time at a month's notice. During the last three years the services of no less than six Indian Temporary Engineers have been dispensed with whose services extended from 8 years to 16 years, of these at least three Temporary Engineers had rendered continuous approved service and had had generally obtained good recommendations from their Engineers. These are cases of real hardship, and there seems to be no moral justification at all for treating this important body of public servants in such an arbitary and unfair way. It is in my opinion not at all right for the Government to apply the rules which are intended solely for purely temporary service to the present body of Temporary Engineers, who are temporary only in name. Great moral injustice has already been done to a good many temporary engineers whose services have been dispensed with in the past merely on the ground that at the time of appointment they were clearly made to understand that their services were liable to be dispensed with at any time it was considered necessary or advisable to do so, without paying any regard to the length of their service or to the quality and quantity of the work done by them. It is time now that something should be done for preventing the recurrence of similar injustice in future. Since the temporary Engineers are required to do the same work and to bear the same responsibilities as the permanent Engineers, and many of them have rendered not only approved but distinctly meritorious services, there seems to be no good reason why all those who have proved themselves to be as good Engineers as the permanent men be not brought on to the permanent service. I would therefore recommend that a yearly selection be made from amongst the temporary engineers now in service for being made permanent as if this service were one of the regular sources of recruitment for the Engineers, and their position on the list should be fixed just in the same way as was done on the last two occasions when a number of temporary engineers were brought on to the permanent list. It is no doubt true that the permanent Engineers regard it as a grievance that a temporary engineer when made permanent should be placed above their heads and there can be no manner of doubt that this grievance is quite a reasonable one. But this is a case in which the Government must chose between two evils, and in my opinion the injustice done to the temporary Engineers of fairly long standing and approved service by keeping them under the existing unsatisfactory conditions of service is much greater than that done to the permanent Engineers by putting above them in the list capable and experienced temporary Engineers, who are senior to them both in service and years, when they are made permanent.

71,739. **(IV.) Condition of salary.**—The scale of salaries as revised in the reorganization scheme of 1908 is quite adequate and satisfactory for the Imperial Engineers, but the one provided for the Provincial service is unsatisfactory, first because it has been actually felt by the Provincial Engineers now in service that their present salaries are not commensurate with the arduousness of their duties and the magnitude of their responsibilities. Secondly because the Provincial Engineers can not but feel dissatisfied and discontented when they find that the Imperial Engineers who do exactly the same kind of work as they do were drawing one and a half times as much pay as they were doing. Same work same pay is a principle which holds good everywhere. Hence any infringement of this principle is felt keenly by the party concerned.

71,740. **(V.) Conditions of leave.**—Hitherto two sets of rules have been in force in the Public Works Department, the Indian service leave rules and the European service leave rules. The latter are much more favourable and liberal than the former. This differentiation has apparently been made on the understanding that Europeans stand in need of leave much more frequently and for a longer period of time

than the Indians. But it does not appear to be a good principle to make distinctions of this kind on the basis of race or creed. Moreover the conditions have all changed now and the requirements of Indians have increased a good deal. Hence it is recommended that the leave rules should now be made the same for all the Engineers in the Public Works Department whether recruited in England or in India. It might be taken for granted that no one would care to take more leave than he actually wants either for his health or for urgent private affairs. Even at present there are people who do not avail of all the leave that is due to them. Hence a liberal provision of leave in the leave rules, for all Engineers is not likely to be in any way disadvantageous to the Government.

71,741. **(VI.) Conditions of pension.**—The present scale of pensions is certainly inadequate both for the Imperial and the Provincial Engineer services. It should therefore be made more liberal and should be kept the same for all Engineers whether recruited in England or in India. Similarly the other conditions of pension should be the same for all Engineers irrespective of race, creed or colour. Europeans in the Imperial service have been hitherto able to retire after rendering service for 15 years. The same rule should be made applicable to all Engineers.

71,742. **(VIIa) Limitations in the employment of Non-Europeans.**—(1) There ought to be no limitations at all in the employment of non-Europeans (viz., Indians both pure and Statutary) in the Public Works Department. Even the last Public Service Commission of 1886-7 had recognized the principle that "all His Majesty's subjects should receive equal treatment and that 'all invidious distinctions of class or race' should be removed." Hence the real reason why this commission recommended the introduction of a Provincial Engineers Service appears to be the fact that the report of the Sub-Committee appointed to deal with the Public Works Department was distinctly unfavourable about the capacity and aptitude for higher Engineering of the Indians in particular and the Indian College Engineers in general. In this connection the following passages occur in the report of the Sub-Committee:—"...The professional education received there (at Cooper's Hill) is superior to any obtainable in India, the professors being more able and more numerous, the range of study wider and the opportunity for seeing the execution of large Engineering works much greater. . . . The general education of Cooper's Hill men is superior to that of Indian students, and this, as well as their English training gives them greater aptitude for applying their professional theoretical knowledge. Against this it is allowed that for the first three or four years of service Europeans or Eurasian students from Indian Colleges possess a decided advantage over Cooper's Hill men by reason of their knowledge of Indian languages and greater familiarity with the habits of the people, and acquaintance with the resources of the country. It is also stated that they are more amenable to discipline than the younger men who come out from Cooper's Hill." As to Native Engineers, while it is allowed that there are some brilliant execeptions, it is asserted by many witnesses that they are inferior to Europeans in force of character and capacity for dealing with men, that they shrink from responsibility, and are not to be depended on in emergencies calling for presence of mind and resource, and that they are less active, physically and mentally, defects which increase as they advance in years. Their dislike to service far from their home . . . renders them less useful. The aptitude of educated natives for Mechanical Engineering and what may be called higher Engineering is said to be small, and while often very good executive officers on works requiring only the imitative faculty they fail in originality and invention."

(2) This is indeed a heavy indictment and is divided under two heads (1) Against the Indian College Engineers taken as a whole, and (2) Against the Indian Engineers. It is based on the evidence of 52 witnesses of which 21 were Indians and 41 Europeans. It appears, however, that no notice whatever was taken of what the Indian witnesses said in their evidence. They were no doubt in the minority, but this was not their fault. There are always two sides of every question, and if we ignore one side altogether on the ground that it is represented only by a minority we can never come to a correct solution of the question. The evidence given by the Indians (mostly Engineers) before the last Public Service Commission might be summarised as below:—

(*a*) Although the profession of Engineering was a very good training field for the Indians and the object of their ambition, yet they could not afford to study for it, because the guaranteed appointments were so very limited, especially in the Sibpur, Poona, and Madras Colleges, and there was no demand yet for Civil Engineers outside Government Service.

(*b*) The establishment of the Cooper's Hill College was an altogether unnecessary burden on the finances of India and was wholly unjustifiable in veiw of the fact that so many Engineers turned out every year from the Indian Engineering Colleges were left unprovided for and had either to accept inferior posts or turn to other walks of life after wasting a good deal of their valuable time in the pursuit of Engineering.

(*c*) The Indian Engineering Colleges turned out men competent to undertake any work in this country. The courses of instruction in these colleges were sufficient for the requirements of the Department, and the training given both theoretical and practical was not inferior to that given at Cooper's Hill. So far as technical knowledge went, there was no difference between Engineers educated in India and England.

(*d*) Civil Engineers trained in India procured the execution of work by the influence they exercised over the labouring class, whereas those recruited in England, get the work done (equally well no doubt so far as technical knowledge went) but more by compulsion than influence. The reason why Indian Engineers sometimes do not do so well as the Europeans on larger works is that sufficient scope is not given to them.

(*e*) Energy in carrying out works depended on the individual. Indians could undergo greater fatigue and could knock about a good deal more than Europeans, while they showed the same energy in pushing on work. Eurasians and domiciled Europeans could not endure so much hardship as Indians.

(*f*) The Indians had only lately begun to appreciate the Engineering profession.

(*g*) The Indian Engineers were better than Europeans for checking scamping of work and fraud on the part of contractors, while in the efficiency of the work done by the two there was not much difference.

(*h*) The Indian Engineers can work more economically than the Europeans on account of their superior knowledge of the country, people, language, and the resources and labour capacity of the district in which they were employed.

(*i*) The Cooper's Hill Engineers after being in the country for 4 or 5 years looked rather inexperienced, and were put in charge of Sub-divisions too early. They were seldom found to be well-versed in vernaculars, while a good command of the vernacular language was essential for efficiency in work. They generally kept the Indians at a distance.

It is a remarkable fact that the statements of these Indian witnesses as summarised above with but slight modifications hold true even to-day, viz., after the lapse of more than a quarter of a century. On the other hand the statements made by the European witnesses before the last Commission can be easily shown to be for the most part imaginary and inaccurate at the present time at any rate. Thus it was all the more necessary that the almost unanimous evidence of the Indian witnesses about the points noted in the above summary should have been duly taken into account and recommendations by the commission modified and enlarged accordingly. Had this been done the Cooper's Hill College should have been abolished about 13 or 14 years earlier than it was, and the number of guaranteed posts for the Sibpur, Poona and Madras Colleges at least should have been substantially increased. It becomes amply clear that the feeling about these two points was very strong and

the grounds advanced in support of the recommendations made were very sound and reasonable.

(3.) The evidence of one particular witness, Mr. J. R. Upshon, establishment clerk, Public Works Department Secretariate, Madras, which has not been summarised in the report of the Sub-Committee for the Public Works Department is of special value as appears from the following extracts:—"With exception of the one guaranteed appointment the Engineering Establishment in this presidency is entirely closed to Natives of India. So far back as 1871 the evil results of such a monopoly were noticed and a Committee formed to propose some remedial measures. . . . In their report the Committee remarked . . . 'we are satisfied that it is expedient to hold out to the Natives of the country better prospects in the Department than have as yet been open to them. We would remark that Natives . . . have within recent years successfully filled many offices of trust . . . have many advantages in ascertaining correctly the wants of the villagers, and in being able to explain to them to what extent those can be provided for by the Government under the rules in force. We think that a serious mistake has been made in the administration of the Department in not fostering the Native talent and enterprise in a profession for which old hydraulic works of the country show that the Natives of this presidency possess a remarkable degree of Native aptitude.'"

"Before the year 1872 . . . only five European passed students (out of 30 A. C. E.'s who turned out of the Madras College between 1863 and 1872) were appointed to the Department as Assistant Engineers while the Natives and Eurasians who passed earlier and better received only Overseers' posts—the lowest in the Department."

"During the same period (1863-1872) 78 Europeans were appointed to the Department as Engineers. The discouragement shown to Natives led many of them to seek employment under other Governments or to enter other walks of life."

"From the year 1863 to 1886, 78 Natives of India have qualified for the Assistant Engineer grade, and of these only six have been given appointments as Assistant Engineers. In the same period 144 Europeans . . . have been appointed to the Engineers' Establishment of the Madras Public Works Department to the nearly entire exclusion of the children of the soil."

The facts and figures given by the witness clearly showed the necessity of abolishing the Coopers Hill College and of encouraging the Indian Engineering Colleges by giving them a larger number of guaranteed posts; but no such recommendation was made by the Commission. It shows that sufficient attention was not paid, or sufficient attention was not given to evidence of the Indian and Eurasian witnesses, although their number was more than one third of the total number of witnesses examined in this connection.

(4.) If the conclusion drawn above is correct and the report of the Sub-Committee for the Public Works Department was based mainly on the evidence of the European witnesses, without giving due weight to the evidence of the other witnesses the force of the indictment made must be considerably reduced. However, even apart from this consideration it can be shown that this indictment does not at all hold true at the present time. To begin with the first part of this indictment which is directed against the Indian College Engineers as a whole, it appears that up to 1886-1887 when the Commission sat no Indian College Engineer had yet risen to the administrative grade, hence none of the witnesses could have had any experience of their capacity for such work. But since then a large number of Indian College Engineers have attained to the administrative grade, several of them have acquired a world-wide fame, and it has been generally admitted by competent authorities that Indian College Engineers were in no way inferior to those recruited in England. Even if we turn to facts and figures we find that in case of the Punjab the total number of Rurki Permanent Engineers who joined the Public Works Department up to 1895 is 79, while the corresponding number of Engineers recruited in England including the Royal Engineers is 261. Out of the 79 Rurki Engineers 24 have risen to administrative grades and of these 24 men no less than 12 have risen to the grade of Chief Engineers. This gives a percentage of 31 for promotions to the administrative grade and of over 15 for those to the post of Chief Engineer. In case of the Engineers recruited in England, out of a total number of 261, eighty-six were promoted to the administrative grade and 39 to that of Chief Engineer, giving the corresponding percentage of less than 33 and less than 15 respectively. This comparison clearly shows that the Rurki Engineers are in no way inferior to foreigners, and the result of the comparison would have been ever better than this, if the Indian Engineers had not been kept studiously out of the administrative grade in this Province. This is I believe a complete and effective reply to the indictment against the Indian College Engineers.

(5.) As regards the indictment against the Indian Engineers the first point to be noted is that the members of a service do not naturally like the *intrusion* of an alien new-comer among themselves, and the greater the degree of alienation between the new-comer and the existing members of the service, the greater is the intensity of dislike. In the beginning the Public Works Department was entirely manned by Royal and other Engineers recruited in England. Then came the Cooper's Hill men. The Royal Engineers duly resented their regular entry into the Department in large number and for some time the controversy about the inferior merits and capacity of the Cooper's Hill men as compared with the Royal Engineers went on, but ultimately it had to be admitted that the Cooper's Hill men were in no way inferior. Then began the controversy about the inferiority of the Indian College Engineers (even Europeans). This controversy also was settled in favour of the latter when authorities like Lord Macdonnell and Sir John Hewett testified to the high merits and capacity of the Rurki European Engineers. Now then comes the last stage of this controversy and it is now the turn of the purely Indian Engineers to be branded with inferiority as compared with European Engineers, and this time the controversy has taken a more acute form because the distinction of race and nationality is also involved in it.

(6.) Experience of the past controversies ought to have shown to those who have taken up a hostile attitude towards the Indian Engineers that human nature is everywhere the same and that education is a great leveller. Every race and nationality does no doubt possess its own characteristics both good and bod. But this does not mean that any of those characteristics is unchangeable. The power of adaptation to *environments* is very strong in man, and with the help of education he is capable of making astonishing transformation. All the defects and shortcomings of the Indian Engineers, which are contained in the indictment, appear to be based on hasty conclusions derived from insufficient data. Because it appears from the report of the Sub-Committee for Public Works Department that there were no more than 86 Indian Engineers in the whole of India in 1886-87, and the European witnesses who found all sorts of faults with them were as many as 41 coming from all parts of India out of a total number of 929 European Engineers. Hence these witnesses must have had (as some of them frankly admitted) a very meagre personal experience of the Indian Engineers. In spite of this most of them did not refrain from making sweeping assertions about the decided inferiority of Indians to Europeans in almost every respect. This shows the general tendency of Europeans to misjudge Indians, which is as much in evidence now at the present time as it was 27 years ago. The European Engineers do not as a general rule come in real touch with the people of this country and therefore cannot possibly have that intimate and all-sided knowledge of their juniors in service (whether European or Indian) which is essential for forming a correct opinion about the real capacity and character of a man. Hence all their ideas and impressions about them are necessarily incomplete and one-sided. Their European juniors mix with them freely and have every opportunity of putting their good points in the

best light before them. The Indian Engineers on the other hand do not mix much with their European superiors. Their relations with the latter are for the most part formal and official. Hence the knowledge of the European Engineers about their Indian juniors is in most cases superficial and necessarily one-sided. Add to this the fact that it is an inherent tendency of human nature to feel a sort of inward liking and partiality for those who are akin to it, and that there are a number of shibboleths and preconceived notions which many European Engineers entertain about the Indians, and it will become amply clear why a European Engineer generally considers an Indian Engineer essentially inferior to himself.

(7.) Now if we turn to actual facts and figures; it is quite easy to show that the Indian Engineers are in reality quite capable of exercising the highest Engineering skill, and of doing all these things and meeting all those situations successfully which they are considered incapable of doing. The only difficulty in their case has been that sufficient opportunities are not given to them on the *a priori* plea of incapacity.

(*a*) The Delhi Durbar of 1903 was entirely managed by Indian Engineers.

(*b*) The Eastern Bengal Railway is being very ably and successfully managed by an Indian Engineer-in-Chief.

(*c*) From statistics collected specially for this purpose any number of examples are available in which the Indian Engineers have displayed promptness of action and soundness of judgment in cases of emergency, have taken the fullest responsibility in difficult situations and met them successfully, have exhibited great resourcefulness, and presence of mind, have shown a good deal of activity both mental and physical, and have displayed marked aptitude even for Mechanical Engineering.

(*d*) Some of the Indian Engineers have displayed a marked and special aptitude for Engineering, some for administrative work and some have given evidence of other high qualities on the possession of which the Britishers "have prided themselves for centuries." From what has been said above it is, I believe, very clear that the second part of the indictment given above is as unfounded as the first one. Hence there is no reason whatever why any limitation should be imposed on the employment of non-Europeans.

(8.) These limitations are, however, very much in evidence at present. In addition to the non-employment of the Provincial Engineers in the Imperial service, there is the restriction against promoting Indian Engineers to the administrative grade, in as much as the latter do not get these promotions simply through a good and unblemished record of service as Europeans do. Again it is a fact that none of the Indian Temporary Engineers has yet been made permanent, although a number of European Temporary Engineers have been so promoted on more occasions than one. Such limitations and restrictions against the Indian Engineers are all the more keenly felt because these are often made quite arbitrarily and without any known reasonable cause.

71,743. **(VIIb) Working of the existing system of division of service into Imperial and Provincial.**—The whole scheme of the introduction of the Provincial Service was based on the assumption that the Indian College Engineers, especially the Indians, could be employed as, what are called, the clerks of works, in England, "for all work of a lower description and the ordinary construction and repairs in the Buildings and Roads branch," and that the European Engineers could be reserved for Engineering proper. This assumption has in actual practice been proved wrong, and it has not been found practicable to make any such distinction beween the Provincial and Imperial Engineers. On the other hand the Provincial men have shown that they were not only doing the same work and bearing the same responsibilities as the Imperials, but have *on account of their greater and more intimate knowledge of the country and its people, also been able to do their work more satisfactorily and efficiently than the European Imperial Engineers.* It has surely been on the basis of facts like these that the Government of India in their Resolution No. 430-450 E of 1912, have virtually recognized the quality of Provincial and Imperial Engineers by bringing them both on the same list and making the conditions of service the same for both. This being the case there seems to be no good reason why the distinctions in pay and allowances, and leave and pension rules of the two services should not also be removed. This would entail no large or heavy expenditure as the following figures would show. The number of Provincial Engineers in the whole of India at the present time is estimated to be about 165. By rising their pay by one half an expenditure of $165 \times 280/- = $ Rs. 46,200 or say 50,000/- per month will be incurred, against the total expenditure of about Rs. 750,000 on account of the salaries of more than 900 Engineers in the whole Public Works Department of India. This means an increase of about $6\frac{1}{2}$ per cent. only, which is nothing when compared with the annual income and expenditure of the Public Works Department which is as below for the 1910-11:—

Total Income (gross)	Rs. 51,89,68,201
Total Expenditure	Rs. 34,85,90,505
Total Expenditure on Establishment	Rs. 5,82,45,379

71,744. **(VIII.) Relations of the service with other services.**—It is the Irrigation Branch of the Public Works Department which generally comes in contact with the Civil Department through those who irrigate their lands from canals. In some cases in the past misunderstanding and friction have arisen between the two Departments in connection with Irrigation matters. This has generally been the case on those canals only where the Civil Department had a direct or indirect hand in irrigation; and the cause of this misunderstanding has as a rule been the inability of the civil officers to grasp the more or less technical principles of Engineering. The best way of getting rid of this occasional friction between the two Departments is to give to the Engineering Department the entire control of irrigation and to hold them responsible for both the results and the methods of working. The other alternative of taking away the Revenue work of the canals from the Public Works Department and entrusting it to the civil people, which is sometimes proposed by some civil officers, is most inadvisable and harmful, and is calculated to lead not only to complications of various kind, but to want of efficiency and good management also.

71,745. **(IX.) Other points.**—The chief problem of the day is—how to improve the relations between the educated Indians and the Europeans. The urgency and importance of this problem is as keenly felt in the Public Works Department as in any other. That the existing state of things is unsatisfactory is admitted on all hands. But the question of reform is difficult. The fight is between old established convictions and preconceived notions on the one hand, and an evergrowing spirit of freedom and self reliance on the other. There was a time when all or almost all Engineers were Europeans and this time lasted for a long while. At that time the subordinates who were of course almost all Indians looked up to the European Engineers as superior persons who were capable of doing wonderful things and taught them how to do them. They admired them and praised them and thereby acquired a good deal of power and influence over their countrymen. The European Engineers, on the other hand, felt duly proud and conceited at the importance attached to their person, and always looked upon their subordinates with a patronizing eye. They used to be particularly pleased with the old fashioned vernacular speaking sweet-tongued and long robed Indian gentlemen who, in the capacity of their Head Munshi or Zilladar, had nothing but praises for their superior master. It was this kind of Indian etiquette which they appreciated most. At the same time they carefully noted all the faults and shortcomings exhibited by their subordinates, and attributed them to their belonging to an inferior race of men, who had acquired certain unchangeable characteristics on account of having passed through centuries of corruption and misrule. It was evidently during this period that the European Engineers must have formed a good many of their preconceived notions and prejudices against the Indians. These

were in course of time matured in traditions which were handed down by one batch of Engineers to another, till they have come down to the present time.

Now, however, the conditions have changed entirely. The long robed sweet tongued gentleman of old is fast disappearing. Well-educated Indian Engineers possessing the same qualifications and the same capacity for work as the European Engineer are daily increasing in number, and taking the places which were occupied by Europeans, and so far as opportunities are afforded they have proved themselves to be fully equal to all situations however difficult they might be. These new conditions are evidently not to the taste of the European Engineer whose deep-rooted idea of the essential superiority of Europeans over Indians is difficult to change. Hence he must find reasons in support of his idea, and must discredit the Indian Engineer wholesale, whenever he shows any failing or shortcoming. It is I believe, partly on account of this feeling and partly due to want of sufficient knowledge of the country and its people that Indian Engineers are often misjudged by their European superiors especially when the comparison lies between an Indian and European.

LALA RADHIKA NARAYAN called and examined.

71,746. (*Chairman.*) The witness said he represented the Engineers' Association of Lahore, an organisation consisting for the most part of Indian Engineers belonging to the Punjab Public Works Department and the North-Western Railway. It consisted of 55 members, and the opinions expressed in the written statement were generally agreed to by the Association. The main points of the recommendations were the abolition of the division into Provincial and Imperial and the creation of an Imperial Service to be recruited by open competition and under uniform conditions. That proposal was made because Imperial and Provincial Officers were now employed on the same work and had the same responsibility, and also because the Indian College recruits were as good as the recruits obtained from England. That opinion was based on statistics he had collected from other Engineers more than 30 in number and on his own experience. He had had both European and Indian officers under him and the Indian officer had been as efficient as the European officer.

71,747. With regard to the proposal that Rurki should be the main college for training the superior staff, the witness thought in such a large country as India one college would not be enough, and his opinion was that the four existing colleges should be raised to the same standard as Rurki.

71,748. With regard to recruitment, the witness considered that for the present at any rate it would be necessary to recruit about one-third of the superior Service in England, the other two-thirds being recruited in India. It was quite true that as good men could be obtained in India as in England, but he thought the change from English recruiting to Indian recruiting should be brought about gradually.

71,749. The witness considered that specially selected officers in the subordinate Service were sufficiently well qualified on the average to be allowed opportunities of promotion to the superior Service. The subordinate Service might be improved if its members were given better opportunities of promotion and if care was taken to ensure that the men promoted were of high character. They should receive promotion on the results of their work but great stress should be laid on character.

71,750. With regard to the employment of Royal Engineers, the witness said they should not be employed as a rule because they superseded men who were already in the Service. If arrangements could be made to obviate that, he would have no objection to their employment.

71,751. On the subject of recruitment in India the witness did not recommend an all-India examination, because he thought it was unnecessary and would entail hardship on students coming from remote parts of the country. He was *therefore in favour of having* different centres.

71,752. The witness saw no difficulty in the way of bringing the present temporary Engineers into the permanent cadre. The temporary Engineers should be considered as a source of recruitment and a certain percentage of temporary Engineers should be recruited every year. Administrative difficulties could be easily prevented by promoting upper subordinates and giving them the charge of sub-divisions. In the Punjab Irrigation there were at present 37 sub-divisions in charge of upper subordinates and the number could be easily increased. It was not necessary for the prevention of blocks in promotion to increase the number of divisions. There would be no increase in the junior posts, as the surplus sub-divisions would be given to upper subordinates. In the Punjab Irrigation there were 129 sub-divisions and 43 divisions, and if the sub-divisions were kept 10 per cent. in excess of the number of divisions in charge of the permanent Engineers there would be no block. Now the number of sub-divisions was so great that if manned entirely by permanent Engineers there would be a block, but if the number of sub-divisions in charge of Engineers was reduced there would be no difficulty. The sub-divisions allocated to Assistant Engineers might be reduced to 59 or 54 or some other suitable number, and the others given to upper subordinates. At present 37 of the sub-divisions were in charge of upper subordinates, 45 in charge of temporary Engineers, and the rest in charge of permanent men. He did not suggest that the temporary Engineers should be made permanent at once; a certain percentage of them should be taken every year. For example, forty men being required every year, five would be taken from temporary Engineers and the recruitment from other sources decreased accordingly. The senior men would be taken first. Everything would remain as before except that recruitment from other sources would be reduced.

71,753. With reference to training, the witness said he would favour sending an officer to England for a European training after he had been some years in the Department.

71,754. In the matter of pay, the witness wished to see the establishment of uniform conditions. Assuming it was decided that the market values of Europeans and Indians were different and that one required a higher salary than the other, and assuming also that a uniform scheme on those lines were instituted, the witness did not think that discontent would be less than it is at present. Race distinctions were always resented by the race which was considered inferior, and he objected to any distinctions in pay which were based on race. An Indian drawing less pay was certain to be looked down upon by a European receiving higher pay. Also, the witness said, he would not accept a scheme for one superior service with a foreign service allowance to Europeans. He thought both schemes were equally bad, and if his scheme of equal pay was not accepted he would not prefer the foreign allowance scheme to the existing state of things.

71,755. With regard to the age of retirement, as optional retirement was allowed to Europeans after twenty years' service he wanted the same privilege for the Indian officers also. He did not think twenty years was too early for optional retirement because he believed only those men would retire who needed to retire at that early age. He could not say that a man of 42 or 43 was too old to do any useful work.

71,756. (*Sir Murray Hammick.*) The witness said he *was born in Delhi and entered the service before the Provincial Service was introduced, and he was drawing the same pay as officers in the Imperial Branch* and had no personal interest in the recommendations made in his written statement. He had been in the service twenty-three years, had nver been to England, and was now an Executive Engineer, first class, drawing Rs. 1,250. He did not think pay on the present Imperial scale would be excessive for the whole of the Provincial Engineers' service. No really good Indian Engineers would willingly join the Public Works Department on rates of pay lower than were given to the Imperial Service.

71,757. The witness said he looked forward to the time when English recruitment would be quite unnecessary for the Public Works Department. He did not think the men now entering the Provincial Service were of a different class from those that entered

the Imperial Service. It was only owing to their straitened circumstances that they were compelled to enter the Provincial. The reason why men now went to Rurki and passed a stiff examination to get into the Provincial Service was not that the attractions of the Service were sufficient but because there was no other open door to Government employment for men who had not sufficient money to go to England for training. There was very little private employment for Engineers in India, and the only service which could compare with the Public Works Department was the Civil Service which they could not enter without going to England. The Provincial Civil Service he did not think was better than the Provincial Service of the Public Works Department. He did not believe the Provincial Service of the Public Works Department was more attractive than other branches of Government service, such as the Police or Postal Departments. He could not agree that it would be extravagant to pay the whole of the Provincial Engineers' Service recruited in India at Imperial rates of pay, even though they are at present doing the same work at two-thirds that pay. They were in a way obliged to enter the Provincial Engineers' Service because their circumstances did not allow them to train themselves for any other service. Hence it could not surely be called a proper service.

71,758. (*Sir Valentine Chirol.*) The witness admitted that the market price of work all the world over was determined by the force of circumstances; but pointed out that whilst in other civilized countries only the natural circumstances operated, in India artificial circumstances which could be easily removed compelled many capable Indians to join inferior services.

71,759. (*Mr. Madge.*) The difference between the Association of Indian College Engineers and the Indian Engineers' Association was that the latter contained Temporary Engineers as well as Imperial and Provincial Engineers, while the former consisted only of Provincial men. There was no bar to Europeans and Anglo-Indians joining the Engineers' Association, but at present the members were all Indians.

71,760. With reference to the statement that Engineering work in India differed from that in England, the witness said there were very large differences. For instance, India had specialised in Irrigation work which was not to be found in England, and the Railways in India were different owing to the number of wide rivers that had to be bridged, and also there was a different style of architecture in India from that obtaining in England. The fundamental principles of Engineering were always the same, but the specialities in India required special study.

71,761. The witness said that in his opinion the experiment of the Provincial Service had failed. On the basis of his own personal experience and of the evidence he had collected he thought it was true to say that as a rule the European Imperial Engineers were not in real touch with the people of the country.

71,762. (*Mr. Macdonald.*) The witness said he was acquainted with the criticisms on the cost of Government in India made by the Indian people, and he admitted that the argument had been commonly used that England had staffed the Public Service of India with men who were greatly overpaid. He did not dissociate himself from that argument, though in case of the Public Works Department he looked at it from quite a different standpoint. He was of opinion that the administration of an Indian was much cheaper than that of a European, as he could manage things much more economically than a European. Considering that the Engineer's post was of very great responsibility and trust he did not think that the salaries paid to Europeans were much too high in the case of the Public Works Department. For the same reason he was of opinion that the European officer in that Department had never been overpaid. If the Service was composed entirely of Indians he could not favour a reduction of pay, though the next revision in an upward direction could in this case be delayed much longer than otherwise.

71,763. (*Mr. Fisher.*) The witness said that in taking up that position with regard to pay he was considering the question also from the point of view of the taxpayer. If the circumstances of the country changed so much that men employed in the Service were not content with their pay it was necessary that the pay should be revised; otherwise the taxpayer would lose much more on account of the evergrowing discontent of the officer than he would gain by the curtailment of his pay. The witness would not accept his suggestion that his philosophy of progress was that the Public Service of India should show an increasing measure of discontent with their pay every year; his view was that when men found they could not subsist on their pay, and that higher pay was to be obtained elsewhere, they would naturally endeavour to get an increase.

71,764. (*Mr. Sly.*) With reference to the statistics in the written statement, comparing the proportion of Rurki-trained Engineers with Engineers recruited in England, the witness said that out of 79 Rurki Engineers 18 were Indians and 61 Europeans. The figures were taken up to the year 1895. The Coopers Hill men came out in 1873, so that up to 1895 very few Coopers Hill men could have been promoted to administrative rank. Therefore so far as Coopers Hill was concerned the comparison had very little value. Of the total number of 261 Europeans recruited in England up to 1895, 61 were Royal Engineers.*

71,765. (*Mr. Aikman.*) The witness said he did not think it was correct to say that at present the Civil Engineers appointed in England, including 10 per cent. of Indians, amounted to 20; that number applied only to one year and did not represent the average, which was not less than that given in his written statement. The witness admitted that the proportions now given by the Government of India, 48·6 of English Engineers, 43·3 of Indian Engineers and Indian College Engineers, and 8·1 of Royal Engineers, were very different from the proportions given in his own written statement, but he thought it was an unfair comparison, first because the upper subordinates should not be included, as they generally did not rise above a Sub-Divisional Officer's post; secondly because the number 20 mentioned above was altogether incorrect.

71,766. With regard to the question of supplying Engineers to smaller District Boards, the witness suggested that upper subordinates might well be employed as they were quite qualified for such positions.

71,767. With regard to training, the witness said he had known of Engineers from England being appointed direct to sub-divisions, but as a rule they were put under an Executive Engineer for training.

71,768. With reference to the question of higher rates of pay for imported labour, the witness said higher wages were paid to imported coolies such as Pathans, not because they were imported, but because they were capable of doing more work than the local labourer.

71,769. The witness did not admit that the fact that Indians were sending their children to England for education was an admission that Indian education in Civil Engineering left a good deal to be desired, but he admitted that in case of Electrical and Mechanical Engineering, education in India was backward.

71,770. With reference to the statement that not a single Indian in the Punjab was allowed to enter the administrative grades, the witness said he did not think that was because the men were not fit for such grades, as he knew of at least one case of an Indian Engineer who was quite competent to fill an administrative post.

* The witness afterwards pointed out in a written note that the admission about comparison with Coopers Hill being of little value was due to an oversight. The figures were taken up to 1895 so far only as recruitment was concerned. The figures for promotion to administrative grade were, however, up to date. Hence all the Coopers Hill men who joined the Punjab and had risen up to the administrative grade were included in the comparison, which was in consequence fully applicable to the Coopers Hill Engineers as well.

(The witness withdrew.)

At Calcutta, Saturday, 20th December, 1913.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman.*)

THE EARL OF RONALDSHAY, M.P.

SIR MURRAY HAMMICK, K.C.S.I., C.I.E.

SIR THEODORE MORISON, K.C.I.E.

ABDUR RAHIM, ESQ.

WALTER CULLEY MADGE, ESQ., C.I.E.

FRANK GEORGE SLY, ESQ., C.S.I.

HERBERT ALBERT LAURENS FISHER, ESQ.

JAMES RAMSAY MACDONALD, ESQ., M.P.

And the following Assistant Commissioners:—

H. H. GREEN, ESQ., Superintending Engineer, Bengal.

SHASHI BHUSHAN MAZUMDAR, Executive Engineer, Bengal.

R. R. SCOTT, ESQ. (*Joint Secretary*).

B. K. FINNIMORE, ESQ., Chief Engineer, Bengal.

Written Statement relating to the Public Works Department.

71,771. **(I.) Method of Recruitment.**—*Imperial Service.*—All Imperial Engineers are now recruited in England. They are selected from candidates who answer advertisements of the requirements of the Department. The selection is made by a Selection Committee appointed by the Secretary of State. Formerly recruitment was made by competition among students of the Royal Engineering College, Cooper's Hill.

So far I found the Engineers appointed to Bengal under the present system are in no way inferior socially, or so far as their engineering knowledge goes, to those recruited formerly from Cooper's Hill. I do, however, consider that there is not the same *esprit de corps*, or discipline that there was formerly among the Cooper's Hill students. These qualities I consider of as much importance as superior engineering attainments. There are many appointments in the Public Works Department for which administrative ability, honesty of purpose and independence of character are even more essential than engineering training. I consider that the Cooper's Hill training was specially good for the production of such qualities, and I rather fear that the Department may suffer in future from the want of them. If it is not possible to re-establish such a College as Cooper's Hill was in England, I would suggest that the Selection Committee should consider these points in selecting candidates. I think it very desirable that one or even two members of this Committee should be either Engineers of the Department on leave or who have recently retired. Such men would know the better stamp of men required for work in the Department than men who were not serving, or have not recently served themselves, in it.

I consider that if Indian candidates of requisite qualifications can be found among those applying for these appointments there is no reason why the present limit of 10 per cent. should not be increased. Whether the candidates are Europeans or Indians, the best men should be appointed. What we want are men of independent character, active habits and good health, who are likely to form independent judgment, act on it, and not mind being sent anywhere, where the exigencies of the service might require them. It is very probable that for some time to come the proportion of Indians with such qualifications will not come up to the 10 per cent. limit now allowed.

Provincial Service.—The recruitment for the Provincial Service in Bengal is entirely from the Sibpur Engineering College and the large majority of Bengalis. During the last 20 years the nationality of the successful students has been Bengalis 17, Eurasians 4. Bengalis do not, as a rule, care for Engineering as a profession, their special qualifications fitting them much better for the Legal and Medical professions, and therefore we do not get the best of them for Engineers. Bengal cannot be considered on the same lines as the Punjab or the United Provinces, who obtain their recruits for the Provincial Service from the Rurki College. A more efficient Provincial Service would probably result if a Central College for the higher training of Engineers for all India were established, where the Bengalis would come in contact with the more robust races of Northern India.

At present at the Sibpur Engineering College there are many more students than there are Engineer appointments, and all Engineering students who fail to get appointments as Engineers, *i.e.*, in the Superior Service of the Public Works Department, readily accept appointments as Overseers on Rs. 80 to 100 a month in the Upper Subordinate service, which, under present regulations, is mainly recruited in this way. Such men are, as a rule, the men who go to Sibpur in order to obtain some employment, which will give them a living, not because they desire to be Engineers. They are, as a rule, not practical men, and at the same time they feel dissatisfaction that a man who perhaps has simply gained a few more marks than they have in an examination should obtain an appointment in the Superior Service of the Public Works Department commencing on a salary of Rs. 250 a month with a prospect perhaps of becoming a Superintending or a Chief Engineer, while they themselves are relegated to the Subordinate Service for the whole of their lives.

I advocate that the Provincial Engineering Colleges should confine their attention to the training of subordinates, and that a Central College for the whole of

India on the lines of the Royal Engineering College, Cooper's Hill, should be established, and that from this College the Provincial Engineer services should be recruited.

I do not consider that so far the average Indian-trained Engineer is equal to the average English-trained Engineer. By an Indian-trained Engineer I mean the Indian-trained Engineer that we deal with in Bengal—that is, the Sibpur-trained Engineer. We have recently reported to the Government of India that to fill the Engineer appointments in Bengal we require 60 per cent. English-trained Engineers. This is in regard to the fact that we consider we require men superior to the average men we have hitherto obtained from Sibpur for 60 per cent. of the appointments. This indicates the necessity under present conditions for recruitment of a large proportion of our superior establishment in England. To provide for the proper use of the better men among the Indian-trained Engineers, I propose that if properly qualified men could be found they should, after five or six years' service in the Provincial branch, be transferred to the Imperial branch. For the present I would limit such recruitment of the Imperial branch to 10 per cent. If satisfactory men up to this number are found, and it is in the future felt that there are more men qualified for such promotion than this limit would satisfy, the limit may be raised.

71,772. **(II.) Systems of Training and Probation.**—Regarding "Training," as indicated in paragraph 71,771, I consider the best training for the Department would be an Engineering College on the lines of the Royal Engineering College, Cooper's Hill, for Imperial officers in England, and a similar College for the training of Provincial officers in India, with a year's practical training in each case.

Regarding "Probation," I do not consider it necessary that the Imperial Service Engineer should be on probation. It is very desirable, when he first comes to the country, that he should be given a specific independent charge and placed in charge of a section or subdivision to learn his work under a good Subdivisional Officer or Executive Engineer. I consider it desirable that the Provincial Service Engineer should as at present be on probation for one year. He should as a general rule be placed where he can get continuous help and instruction. He should be placed in charge of some definite work after six months' satisfactory probationary service. I differentiate between the Imperial Service Engineer and the Provincial Service Engineer, because as a rule the Imperial Service Engineer has selected engineering as his profession because he wishes to be an Engineer, whereas the Provincial Service Engineer, with whom I have come in contact, often selects engineering as a means of livelihood, and not because he wishes to be an Engineer.

A sugestion has been made that before appointment to the Department Indian-trained Engineers should be given a year's practical training in England. I do not think that at that stage of their career it could be of practical use. It would, I think, be far better if selected officers were allowed to go to England for such training after five or six years' service.

71,773. **(VIIb) The working of the existing system of division into Imperial and Provincial.**—The division of the Department into "Imperial" and "Provincial" is, I consider, essential so long as it is necessary to import Engineers from Europe to fill a proportion of the appointments. Europeans imported must have many expenses, which Indians living in their native country do not have to face. It is not only fair, but necessary that they should be paid more highly.

71,774. **(IV.) Conditions of Salary.**—I consider the present rate of salaries sufficient, but considering that the cost of living in India has increased so much of late years, I would advocate improvement in the Provident Fund, *i.e.*, that Government should add at least 50 per cent. on to the amount subscribed by each officer. At present all that the officers get is 4 per cent. on deductions from their pay. It is very hard for married men to save on their present pay, and it is, in my opinion, far better that Government should improve the Provident Fund rather than increase salaries: it might only induce habits of extravagance among younger men and while they are bachelors. I advocate very strongly that special allowances should be given to European officers stationed in Calcutta. The Bengal Government have repeatedly urged this on the Government of India, but so far with no result. Officers stationed in Calcutta have very responsible work, and are specially selected. The cost of living in Calcutta is far heavier than in the mufassal. It is very unfair that because an officer is good at his work he should be practically fined by being brought to Calcutta. I know for a fact that all European officers stationed in Calcutta, unless they have private means, have a struggle for existence. From the moment they come here they desire to get away. This makes it increasingly difficult to fill the Calcutta appointments satisfactorily. For the efficient working of the Department it is essential that a portion of the Calcutta appointments should be filled by Europeans. The Bengal Government have recommended special allowances of Rs. 250 a month for Superintending and Executive Engineers, and Rs. 150 a month to Assistant Engineers. This is not necessary in the case of Indian officers, as they readily come to Calcutta; in fact they are continually applying for transfer there.

71,775. **(V.) Conditions of Leave.** — *Imperial Engineers.*—I consider the present leave rules suitable, except that there should be no limit in the accumulation of privilege leave. Leave should be granted when officers can be spared and the present restrictions as to period of service between leave be removed, also after eight years' service a minimum leave allowance, while on furlough or special leave, of £500 should be allowed; if a man be invalided before eight years' service, £350. There should be no maximum limit as at present of £800.

Provincial Service.—I consider that the proportion of furlough should be one-fifth of the service to enable the full amount of 5 years' leave being enjoyed in the service of 30 years.

Study leave to Europe, Egypt and America might be allowed to Indians on favourable terms to encourage them to visit engineering works in those countries. Such leave to be on three-fourth pay subject to a maximum of £40 a month and a minimum of £25 a month. It might extend to four months at a time of intervals of not less than six years. Two such periods of leave might be allowed to an officer in his total service. A report of works visited to be made to Government.

71,776. **(VI.) Conditions of Pension.**—*Imperial Service.*—I think that the pension of the Imperial Engineers recruited in Europe should be improved, that is to say, it should be £500 after 25 years' service and £700 after 30 years' service, with extra pensions for approved service in the administrative grades. Considering the increased cost of living in India, it is extremely hard for officers to save any considerable amount during their service, and as a rule all they have to live on on their retirement is little more than their pension, which at Rs. 5,000 a year as fixed at present is quite inadequate to meet their needs specially if they have children to educate, which must often be the case owing to the fact that their present pay does not enable them to marry until somewhat late in their service.

Provincial Service.—The present pension conditions are, I consider, satisfactory.

71,777. **(VIIa) Limitations in the Employment of Non-Europeans.**—I see no reason why the permissible limit of 10 per cent. in the appointment of Indians should not be raised, provided suitable men can be obtained.

The rule should not be that "10 per cent. must be employed," but that "10 per cent. may be employed." This limit to be raised when it is found that the supply of suitable men exceeds this.

71,778. **(VIII.) Relations of the Service with Indian Civil Service and other Services.**—These are quite satisfactory.

Mr. B. K. Finnimore called and examined.

71,779. (*Chairman.*) The witness stated that he was appointed to the Public Works Department in 1881, after being trained at Cooper's Hill, and became Chief Engineer and Secretary to the Government of Bengal in January 1911. Some four months ago he was appointed to the Chairmanship of the Calcutta Improvement Trust.

71,780. On the question of recruitment the witness gave it as his opinion that the men who were formerly recruited from Cooper's Hill came as a rule from a better class than the recruits appointed by the Secretary of State. There was no friction at present between officers belonging to the two classes of the Imperial Service.

71,781. The witness was in favour of the maintenance of the Provincial Service on grounds of economy. It was only fair that European officers should be paid higher rates of salary than locally recruited officers. He would, however, make an exception in favour of specially well qualified Provincial officers by promoting them to the Imperial branch on Imperial rates of pay. The general principle should be laid down that the Provincial Engineer should get lower rates of pay than the non-domiciled European Engineer, but he would waive the principle in the case of exceptionally well qualified officers. He laid more emphasis, however, on the maintenance of the general principle than on the exception he proposed to make to it. If he could not get both the principle and the exception, he would prefer to have the principle alone. In any case the removal of the term "Provincial" would probably go some way towards removing the present feeling of grievance.

71,782. Under his scheme he would recruit 60 per cent. of the superior staff from among English-trained Engineers, and in that proportion there would be an indeterminate number of Indians. If a central college could be established in India, he hoped it might in time be possible to recruit in Indian more than the 40 per cent., which he considered was possible under present conditions.

71,783. He explained that the candidates for the Provincial and Subordinate services were trained in the same classes at the Sibpur College, but his idea was to have a central Engineering College for the whole of India, with a higher standard of teaching. He did not anticipate any difficulty in getting recruits for this college from the different provinces. Even if the course at Sibpur was modified to the extent of having distinct Provincial Service classes, there would still be the difficulty of not having the same standard of teachers. Also a good many more men would be produced than would be required for some little time to come, and consequently there would be a number of discontented men who could not find employment.

71,784. With regard to pay, a subordinate entering the service began at either Rs. 80 or Rs. 100 and became eligible for a subdivisional charge, according to the exigencies of the service, in from two to five years. Occasionally temporary subdivisions had to be formed to which junior men were appointed.

71,785. There was no difficulty with regard to the few temporary Engineers in Bengal, who had been only kept on for a year or two. No temporary man was now doing ordinary divisional work, but there was one in Sikkim, and another was supervising Government estates. They were liable to be dismissed at a month's notice.

71,786. One Royal Engineer had been appointed to the Bengal establishment, but had not yet joined. The employment of Royal Engineers was being extended, and he believed they would be useful in the service. No instance had arisen in Bengal of Royal Engineers coming into the service over the heads of civilians.

71,787. He considered a year's practical training in England necessary for Imperial recruits. The Selection Committee should satisfy themselves either that a man had already been trained on works or that he got such training before he came to India. Provincial Service Engineers might go to England for training after they had been in the service for five or six years.

71,788. There were no facilities for study leave at present, and any officer visiting works at home had to pay his own expenses. He thought officers in the service would be satisfied if they had the same allowances as the Indian Medical Service, but he suggested three-fourths pay.

71,789. Salaries were adequate, but he suggested an improved provident fund with a 50 per cent. contribution on the part of the Government. He did not approve of two time-scales, one for Assistant Engineers and the other for Executive Engineers, with promotion from one class to the other by selection, as it would spoil the prospects of the service. At present promotion was by seniority. If a man was not fit for a division he would not get it, though that was an exceptional case. If a man was not in a divisional charge from no fault of his own, but owing to a block in the service, his incremental pay should continue.

71,790. On the subject of a family pension fund, the witness said there was a general desire in the service for the establishment of a fund on much the same basis as the provident fund which he had mentioned.

71,791. With regard to retirement, a qualifying service of 20 years might be rather short from the Government point of view, but very few men took advantage to retire after only 20 years' service. If any improvement was made in the scale of pensions, it would no doubt be reasonable that the time of service should be lengthened.

71,792. (*Lord Ronaldshay.*) At present in Bengal very junior men were holding charge of divisions. Promotion was good in Bengal at present, and he hoped it would be so for some years to come. All the officers had a division before they reached the Rs. 800 grade. If they had not done so, they would not be entitled to advance beyond Rs. 800.

71,793. With reference to the suggestion that before appointment to the department Indian-trained Engineers should be given a year's practical training in England, his view was that at that stage of their career it would not be of practical use. After men had done a certain amount of work in the department their powers of observation would be better trained and they would have a greater appreciation of the class of work which was being carried out in England. If they went to England at first they would not appreciate the work so much or be so interested in their profession as to observe the differences between work in England and work in India.

71,794. He was not prepared to say that the pay of the Indian-trained Engineer was insufficient to attract a good class of candidate, but it was a fact that the Indian-trained Engineer was not equal to the English-trained Engineer. By recruiting a certain proportion of the Imperial men by promotion from the Provincial Service a better class of man might be induced to come in, but he very much doubted whether that would be so. By promotion he meant simply altering the pay, as officers in the Imperial and Provincial Service were already on one list. There was a feeling at present among some Provincial Engineers that they were as good as men in the Imperial Services and that they should receive the same pay. He was afraid that the scheme he proposed involved the admission that the higher pay given to the European was not given merely because he was serving in a foreign country, but because he was a man of superior qualifications to the Indian, and he agreed that this in a way undermined the whole theory of a foreign-service allowance.

71,795. (*Sir Theodore Morison.*) According to the rules an Engineer could not rise by the time-scale above Rs. 800 unless he was actually in charge of a division, but everybody got promotion to executive rank unless he was particularly bad. A man in the ordinary course went on from Assistant Engineer to Executive Engineer; there was no choice of the best assistants for executive charges. As long as their reports were good the promotion to Executive Engineer was purely by seniority.

71,796. The witness did not propose to give a foreign-service allowance to Indians recruited in England, but if an Indian was selected who had spent many years of his life in England, and had received an expensive education there, it might be necessary to do so. He had had very little experience of Indians trained in British institutions, but from what he had seen of them he should say the result was not superior to the training they received in Indian institutions.

71,797. On the subject of limitations in the employment of non-Europeans, the witness said if more than 10 per cent. of Indians were found suitable they might be appointed; good men should be appointed whether they were English or Indians. Practically, he would revise the two rules with regard to nationality.

71,798. (*Mr. Sly.*) With regard to the bar at Rs. 800, it was true that the unfit were rejected, but that could hardly be called selection, as a man had to be particularly bad not to be put in charge of a division. The rule had been interpreted in Bengal in such a way as to give nearly every man a chance. He did not propose that the bar should be removed. If a man was passed over through his own fault, his pay should be limited to Rs. 800; but if promotion became so bad that it was not possible to give him a division, he should go on to the higher pay. It would be hard luck for a man to have his promotion stopped as a result of irregularities in recruitment. Men should be given to understand that they would rise to the top rank if their work proved satisfactory, since without that understanding the class of man who would come forward would be distinctly inferior. The Government made certain promises and, if those promises attracted good men, the Government must adhere to them.

71,799. As a rule when a man reached 55, he had served about long enough. He thought it would cause a great deal of dissatisfaction to alter the 55-year rule now, and it was not desirable in the interests of the department that men should stop on longer. He would give Government no discretion in that matter; it would be better as a matter of fact for the rule to be extended to all the departments of Government service.

71,800. On the subject of the proposal to establish a provident fund with a 50 per cent. contribution from Government, the witness said he understood the State Railways received a Government contribution amounting to as much as 75 per cent. On the other hand, the State Railway officers had no pensions. He did not propose that the pension scheme for the Public Works Department should be given up. The 50 per cent. contribution from Government would mean about Rs. 33,000 per man. He favoured a provident fund rather than a family pension fund.

71,801. With regard to house allowances, the witness stated that a married man only received a house allowance in Calcutta when he had his wife with him; when the wife was not there the allowance ceased. Even a man with Rs. 1,000 a month found it extremely hard to live in Calcutta, where the cost of living was 50 per cent. more than formerly, and it was essential that a substantial allowance should be given. He recommended a special allowance in addition to the house allowance. There was no necessity to give it to Indian officers, because they were anxious to live in Calcutta.

71,802. On the subject of officers being allowed to take private work during active service, the witness thought that should be strictly limited. He agreed with the present system under which men were occasionally asked for a professional opinion outside their ordinary working hours, but he would not encourage them to go in for private practice *per se*. The fees for such work had to be sanctioned by Government. He saw no objection to men taking up private work when on furlough in England, but he would not encourage them to take furlough in India for the purpose of doing private work. It was rather desirable that they should gain experience by doing such work in England. The great point about furlough was not that it was a holiday, but that it gave a man a change of climate.

71,803. With reference to the recruitment of 60 per cent. of the superior cadre in England, the witness said in Bengal that was the exact proportion at present, because 8 of the Imperial men were trained at Sibpur under the old conditions. At present 70 per cent. was recruited in England and 30 per cent. in India, and his suggestion was that the 70 per cent. should be reduced to 60 per cent. As far as Bengal was concerned, he thought that 60 per cent. was the minimum proportion. The promoted subordinates amounted to 10 per cent., and he thought the promotion of subordinates was satisfactory, as several good practical men had been obtained in that way. He was in favour of such men being allowed to rise above the Assistant Engineer's grade.

71,804. (*Mr. Fisher.*) It would be a good thing for engineering knowledge in India that a certain number of engineering colleges should be definitely marked as inferior. In training subordinates it was a mistake to give them too much theoretical training, because when they came into the department or joined a firm where subordinate work had to be done they felt they were doing work below their attainments. He would have a superior college for Engineers only, and he would not recruit subordinates from that college. The entrance test should be a high one. At present men who went to Sibpur had not sufficient general education to understand what they were taught. They went through a course which on paper should make them very well-trained Engineers, but as a matter of fact a large number of them simply committed a great deal of it to memory. Very few of the examination papers showed that the students understood what they were talking about. He thought in some ways Rurki men had been superior to Sibpur men and had been more ready to rough it, but he could not speak very definitely on the subject. He agreed that the three arguments which had previously been put before the Commission in favour of the establishment of a central college were equally good: that it would enable the Bengali to mix with the natives of the north; that it was inexpedient to mix up the subordinate with the superior classes; and that by concentrating resources on a central college a more efficient college would be produced.

71,805. On the subject of recruitment in England the witness favoured a return to the Cooper's Hill system, because he was slightly disappointed with recent recruits. He was thinking, however, of the early days of Cooper's Hill when there was competition for entrance and an assured appointment and a man had to work hard to qualify.

71,806. There were one or two men in the service from the Cambridge Engineering School, and there were men from Dublin University and the Central Technical College, and King's College.

71,807. On the Board of Selection there should be at least one, if not two, Engineers who were either now in, or had recently retired from, the service. He had generally found the impression he formed of boys was fairly correct, and therefore believed that if he had been on the Selection Board he might have been able to select more suitable boys than had been selected

71,808. He favoured the plan of sending Indians to England after they had had some expereince of engineering work in India. Any arrangement made with firms to take them would have to be carefully considered. It would be desirable to place the officers with firms of contractors.

71,809. (*Mr. Madge*). The witness thought a central college would turn out first-class Engineers who would be of value to India. There was a proposal

now to transfer the Civil Engineering College of Sibpur altogether to Dacca, and that would rather be against the strengthening of Rurki. He was in favour of strengthening Rurki rather than establishing another college at Dacca.

71,810. He desired to qualify his suggestion that officers might be promoted to the Imperial Service by saying that they should be *transferred* from the Provincial to the Imperial branch, not promoted. He would place no limit to the promotion of Indians or Anglo-Indians already in the Imperial Service. When it came to a question of promoting a man from Executive Engineer to Superintending Engineer, he would promote the best man available whether he was an Englishman or an Indian, and he thought that was the general feeling of the service in Bengal. The tendency rather was to promote an Indian if he was fit. He did not agree that promotion should fall short of administrative rank.

71,811. (*Mr. Abdur Rahim.*) On the subject of the proportion of Indian-trained Engineers who had attained administrative rank, the witness thought the figures for the last 20 years would show a very surprising change. Up to 1895 the Cooper's Hill Engineer had not been long enough in the country to rise to administrative rank, the men at that time being the old staff college men trained at Rurki and the Stanley men. A very fair proportion of Indian-trained Engineers had attained to very high rank in the service, but they were recruited from rather a different class of men from the present recruits. In saying that the average India-trained Engineer was not equal to the England-trained Engineer he had referred chiefly to the men he had had experience of—natives of Bengal-trained at Sibpur. Three or four Indian-trained Engineers had reached the position of Superintending Engineers in Bengal. If a man was at all likely to be a success he was promoted, but it did not follow that he was as good as the officer trained in England.

71,812. The proportion of Indian-trained Engineers to English-trained Engineers in Bengal was 40 to 60; for the whole of India he believed it to be 30 to 70.

71,813. The training at the Sibpur College was not so good as it was at Rurki, and there was some idea of improving the training when the college went to Dacca. The reason for removing from Sibpur to Dacca was that Sibpur was unhealthy.

71,814. He desired to see boys entering the college with the same standard of general education as those who went to Cooper's Hill. That would do more than anything that could be done inside the college itself. The training was not defective, but the students were unable to assimilate it.

71,815. On the question of allowances, the witness thought Indians had compensating advantages; it was rather a saving to them to come to Calcutta, whereas it was an expense to Europeans. The only object of the allowance was to keep Europeans contented in Calcutta. Nearly every Indian was anxious to be transferred to Calcutta, and they never referred to the necessity of an extra allowance.

71,816. He would like to have the 10 per cent. rule governing the appointment of Indians to the Imperial Service made permissive and not mandatory, because under the present mandatory rule inferior men might be appointed. It was true there were more qualified men than were needed to fill 10 per cent. of the vacancies, but really good men were required, not simply qualified men. A mere examination was not a sufficient test of qualification He would have no limitation either way, English or Indian, provided the best men were obtained. He preferred selection as at present, but thought the best system would be the Cooper's Hill system, though that was beyond the dreams of probability now. He did not think English boys would be favoured by the Selection Board. He did not object to a competitive examination of selected candidates, but believed it would involve the necessity of raising the pay in order to attract candidates.

71,817. (*Sir Murray Hammick.*) The witness said that if a central college for India were established, he would still make appointments to the service on a Provincial basis, keeping a certain number for Bengal to be competed for by Bengalis, and so on.

71,818. He wished to correct the statement that men should be brought into the Imperial Service after an experience of five or six years, and he would make it ten years, by which time a man would be qualified to become an Executive Engineer and would have reached a stage at which it could be fairly decided whether he was likely to be a good Executive Engineer or not. In Bengal a certain number of Imperial Officers were wanted, because there were charges which were more important than others and which could be only properly looked after by men with an English training. Men promoted from the Provincial Service to the Imperial Service would be given a trial in one or other of those charges. There were also a certain number of heavy divisions and a certain number of light divisions, for which he would generally choose an Imperial officer or the very best of the Provincial Engineers. He had employed an Indian as Under-Secretary for some time and this officer would now be put in charge of an important division. He thought the system proposed would make for the contentment of the service.

71,819. His proposal for a provident fund was put forward as an alternative to his proposal for increased pay. If a provident fund was established, the pay of the Public Works Department was sufficient. Considering the increase in the cost of living, it would be necessary in order to make the pay the same as it was 20 years ago to raise it by 20 per cent.

71,820. (*Mr. Green.*) The witness said he was not aware that retirement at 55 was the rule in the Pilot Service owing to the work being so arduous. The work in the Public Works Department was arduous also.

71,821. There would be very great difficulty in appointing European officers to Calcutta unless special allowances were paid.

71,822. (*Shashi Bhushan Mazumdar.*) It was quite possible for the Selection Committee to judge a recruit by seeing him and considering his record. No recruit from England was trained in Indian engineering and Indian languages, and he did not think it was necessary they should be tested by an examination in such subjects. For the first year or two an officer from England was probably not as useful as a man recruited in India, but he did not agree that on that account an English recruit should be kept on probation for a year or two. That would probably keep good men from joining. He could not recall any instance in Bengal when the officer appointed from England had not been likely to prove efficient.

71,823. It was quite probable that the prospects offered to students of the Sibpur College were not such as would attract the best intellect of India. He did not think the Provincial Service had a bad name. He provided for the promotion of really good men to the Imperial Service, and as better men came forward the proportion would be increased; and he thought that was a fair response to the aspiration of the Indians. Many of the graduates from Sibpur who accepted posts in the service afterwards became District Engineers.

71,824. He proposed that the central college should give a really good engineering training. He was not aware that the Rurki Engineering College had been pronounced by experts to be as good as any in the world.

71,825. With regard to his proposal to promote selected Provincial Engineers after ten years' service, he merely proposed that the very best of the men should be transferred to the Imperial Service. As a rule the English-trained Engineer took up engineering owing to a liking for the work, but the average Indian who went to Sibpur did so not because he wished to be an Engineer, but because he desired employment.

71,826. With reference to the payment of house allowances to Europeans in Calcutta, the witness said he was not aware that the Indian had heavier expenses in connection with his family. He would not differentiate between married and single men or between men with small and large families.

71,827. He recommended that Imperial officers should be allowed more furlough than Provincial officers, because he did not think the Indian-trained Engineer in his own country required as much change as a man recruited from Europe. For the purpose of visiting engineering works the Provincial Service should be given study leave. He did not agree that the same work and service should entitle everyone to the same leave and pension irrespective of the conditions of recruitment.

(The witness withdrew.)

F. A. A. COWLEY, ESQ., Superintending Engineer, Bengal.

Written Statement relating to the Public Works Department.

71,828. **(I.) Method of Recruitment.**—*Imperial Service.*—Having regard to the many institutions in the British Isles which give a training in Engineering Science adequate to the needs of the Public Works Department, the establishment of a college on the lines of the late Royal Indian Engineering College, Cooper's Hill, may now be considered impracticable and selection from the open market must be accepted as an established fact.

(2) The present system of recruitment is generally considered satisfactory, but in my opinion should be limited to candidates who have resided at least five years in Europe. There is a disadvantage in recruiting Indians in England, as it is not always the most suitable candidates who are willing and can afford to go to England.

(3) Only degrees which are recognised by the Institute of Civil Engineers as qualifying for their associate membership should be accepted, or preferably each candidate for admission to the Public Works Department must be an Associate Member of the Institute of Civil Engineers (England).

(4) Assuming that recruitment by selection is maintained, 40 per cent. of the Selection Committee should at least be senior officers of the Public Works and Railway Departments either on the active or retired lists.

(5) The most suitable age for recruits to come out to India is between the ages of 21 and 24 years.

(6) There is strong resentment in the department at the appointment of Royal Engineer officers or Temporary Engineers to the permanent scale above the heads of men already in the department. They should enter the department early in their career and enter with their contemporaries. This rule should permit of no relaxation.

(7) Candidates appointed to the Imperial Service should not be appointed on probation—(*vide* also section 11)—but a year's practical training on works in Europe should be insisted upon and they should be required to pass within three years of their arrival in India the examination known as the departmental examination. Failure to pass this examination should entail loss of increment in salary and seniority.

(8) *Provincial Service.*—For recruitment in India, the Colleges for Engineers should be separate from those for subordinates. It is not desirable that members of the superior service should live on intimate and familiar terms with subordinates as now happens, and is encouraged by the two classes being educated together at the same college. There should be one central college for recruitment in India to the Provincial Service.

(9) Entrance to the college should be—

(*a*) by selection, to be followed by

(*b*) a competitive examination.

(10) Candidates should be between the ages of 22 and 26 on recruitment.

(11) Candidates admitted to the department should be appointed as Assistant Engineers on probation and required to qualify by training for confirmation; they should also be required to pass the same examination as Imperial Engineers.

71,829. **(II.) Training and Probation.**—It should be made a condition of appointment to the Imperial Service that every candidate shall have had one year's practical experience on Engineering works in the British Isles preferably.

(2) Candidates should not be appointed on probation to the Imperial Service, but failure to pass the departmental examination in Accounts and Engineering after appointment should entail loss of increment and seniority.

(3) Candidates appointed to the Provincial Service should be required to qualify for confirmation—the period for qualifying should be one year—and this limit should in no case be exceeded by more than two years in all. After appointment officers should be required to pass the same departmental examination as Imperial Service officers.

(4) Any officer before being given charge of an Irrigation or Embankment Division should also be required to pass the examination in Law as now required under present rules.

(5) Care should be exercised in placing newly joined recruits under sound and sympathetic officers, and they should be placed on suitable works.

(6) Owing to the very extensive use of English throughout Bengal Engineers appointed in England are not required to attain a high degree of efficiency in the Indian languages: the present system of departmental examination is sufficient.

71,830. **(III.) Conditions of Service.**—It is desirable that the Engineers of the department should be constituted into a service under some name such as Indian Engineering Service (I. E. S.). The term Public Works Department is used by subordinates as well as clerks and cannot consequently be held to distinguish an Engineer officer.

(2) The cadre of the permanent Engineers should be more frequently revised. The magnitude and extent of the work in charge of the department is continually increasing and the maintenance of these extended works is part of the duty of the officers of the department.

(3) Officers of the Royal Engineers who are now brought into the service are usually credited with extra departmental service to such an extent as to give them departmental seniority over Civil Engineers who are seniors to them in age and standing in the department. It is necessary in the interests of Government that employment should be found for Royal Engineers in the department, but in justice the appointments should be made in such a manner as not to impair the prospects of Civil Engineers of the same age and standing already in the department.

(4) Similarly, if Temporary Engineers are transferred to the permanent list, the same principle should be observed.

(5) Future appointments of Temporary Engineers should only be made on the specific understanding that the holders will not under any circumstances be brought on the permanent scale. It would remain with Government to improve the temporary service if it is considered expedient. Thus the provident fund for temporary employés on State Railways might be extended to all Temporary Engineers in the Public Works Department.

(6) Article 649 of the Civil Service Regulations, which provides for the compulsory retirement of Civil Engineers, who, on attaining the age of fifty years, have not been promoted to the rank of Superintending Engineers, should be more rigidly enforced in the case of officers who, on reaching that age, are reported as not qualified for promotion to the rank of Superintending Engineers. The principle laid down in paragraph 80, Vol. I, Public Works Department Code, that promotion to the administrative ranks should be by selection as opposed to that of seniority, is the principle on which the above compulsory retirements should be enforced.

(7) Recruitment should be regulated so as to ensure a regular flow of promotion.

(8) There should be some ruling under which Government may compulsorily retire officers of the department who are reported on as unsuitable or inefficient. An officer who has been twice unfavourably reported upon in consecutive years should be warned that if he does not prove himself efficient his

services will be dispensed with. If, after another two years, he is still found unsuitable, he should be compulsorily retired under the ordinary pension rules allowed for men who are compulsorily retired as invalids. Of these four unfavourable annual reports, at least three should be by different Superintending Engineers.

71,831. **(IV.) Conditions of Salary.**—In 1908 the scale of pay of the Public Works Department was reorganized and placed on an incremental basis, but at the same time the exchange compensation allowance formerly given to officers was withdrawn. The net increase in emoluments was not commensurate with the increased cost of living in India, which has been so marked a feature of the last decade.

Before proposals are advanced for the improvement of furlough and pension allowances, which will serve to alleviate those hardships which are most severely felt; and believing that these proposals cannot fail to receive favourable consideration, specific suggestions for an improvement in the scale of pay are not advanced. However, if the Royal Commission, on the careful consideration of the question in regard to other services or departments, consider that the increased cost of living deserves an increase in the salary as at present drawn, it is urged that the Public Works Department should participate in any such general improvements as the Commission desire to recommend.

(2) Under the reorganization scheme of 1908 it is ruled that an officer may not draw more pay than Rs. 800 per mensem unless he is in charge of a division, or in a charge which in the opinion of Local Government is of equal importance. This is unjust to an officer who, though fully qualified, does not obtain a divisional charge simply because there is no vacancy for him. It is urged that the rule should be amended to the effect that an officer of the Imperial Service reported as fit to hold a divisional charge should continue to receive the ordinary increments laid down in the scale, irrespective of his being in actual divisional charge. Similarly, a Provincial Engineer, who is reported on as fully qualified for a divisional charge, should be allowed to draw increased salaries beyond Rs. 535 per mensem according to the ordinary increments laid down in the scale.

(3) Similarly, Executive Engineers attain their maximum pay of Rs. 1,250 per mensem after completing 19 years' service. If, on account of there being no vacancy, an Executive Engineer though otherwise qualified is not promoted to Superintending Engineer's rank after completing 22 years' service, he should be given a personal allowance of Rs. 150 per mensem. Similarly, a Provincial Engineer, who is certified as fit for administrative rank, should be given a personal allowance of Rs. 100 per mensem after completion of 22 years' service.

(4) The present division of the rank of Superintending Engineer into three classes gives rise to blocks in promotion, so that it happens that an officer for no fault of his own never attains the first class rank, or the period of time during which he remains in the second and third class ranks is unduly prolonged: there should be two classes of Superintending Engineer only with salaries as follows:—

	Imperial service. Rs.	Provincial service. Rs.
Superintending Engineer, second class	1,700	1,300
Superintending Engineer, first class	2,000	1,600

The number of Superintending Engineers in each class should be the same, and it would be a mistake to extend the system of annual increments to the administrative rank.

(5) The present division of the rank of Chief Engineer into two classes and the variation of local allowances as Secretary to a Local Government give rise to the anomaly that a Chief Engineer may be drawing less emoluments than a Chief Engineer junior to him in service in another Province, although the work and responsibilities attached to such posts are similar. Promotion to Chief Engineer, first class, becomes so badly blocked at present that many deserving officers never obtain a chance of promotion to the higher rate of pay, or if they do so, only for a comparatively short time previous to retirement.

Considering that the numbers of Chief Engineerships throughout India is small and that with the exception of the posts of Secretary to the Government of India in the Public Works Department and of Inspector-General of Irrigation these are the only highly paid posts to which an officer of the Public Works Department can hope to attain, there should be only one class of Chief Engineer, and the salary attached to that appointment should be Rs. 3,000 per mensem.

For similar reasons and because the appointment as Secretary to the Government of India in the Public Works Department is invariably held by an officer specially selected from among Chief Engineers, the pay of that appointment should be Rs. 4,000 per mensem.

(6) A hardship which is peculiarly felt in Calcutta by officers who may be appointed to hold posts with headquarters at Calcutta is that no local allowances are attached to these posts. The Calcutta house allowance scheme only benefits the married man and then only when his wife or child is actually with him. Should his wife be obliged to go to England for reasons of health, the officer loses his allowance at a time when the allowance is actually worth more than if his wife were with him in Calcutta. The cost of living in Calcutta is well known to be very heavy, and an allowance of Rs. 200 per mensem to Executive and Superintending Engineers and of Rs. 150 per mensem to Assistant Engineers who have their headquarters at Calcutta should be granted and the house allowance under existing rules abolished.

71,832. **(V.) Conditions of Leave.**—*Furlough.*—The amount of leave which Imperial officers of the Public Works Department appointed in England can earn is sufficient. The rules governing the grant of furlough are practically identical with those which apply to the Indian Civil Service and Military officers subject to Civil leave rules, except in the most important particular of leave allowances. In the case of officers of the Indian Civil Service and Military officers subject to civil leave rules, furlough allowances are subject, if paid at the Home Treasury, to a minimum limit of £500 per annum, or the salary last drawn, whichever is less, and to a maximum limit of £1,000 per annum; whereas for Civil Engineer officers of the Public Works Department there is no minimum limit, and the maximum has been fixed at £800 per annum.

As long ago as 1870, in Despatch No. 43 P.W., dated the 28th March, the Government of India said:—"*Section* 16.—With reference to paragraph 4 of Your Grace's Despatch under reply we may remark . . . . . On this point we only add that we shall be glad to see some plan adopted by which the furlough allowances of Civil Engineers shall be equalised with those of Military officers in the Public Works Department and, so far as practicable, the advantage of pension also."

It is however a fact that at the present day a Royal Engineer officer of the Public Works Department, with eight years' service to his credit, is entitled to nearly double the furlough allowances of a Civil Engineer officer doing exactly the same class of work and have the same service in the department.

A Civil Engineer is obliged to complete 18 years' service before he can claim an allowance approaching that which a Royal Engineer is entitled to after 8 years' service.

The present furlough allowances are so inadequate that a large majority of officers cannot avail themselves of the furlough due to them, even though the state of their health urgently demands that they should do so.

The question of leave allowances is raised in the last paragraph of the memorials recently submitted by officers of the Public Works Department. The reply given by Government of India was that "Pensions and leave are subjects of reference to the Public Services Commission; and as no doubt the Commission will enquire into these matters and submit recommendations, the Government of India consider that no useful purpose will be served by considering the prayers of the memorialists at this stage." In

these circumstances it is confidently hoped that the Royal Commission will be able to recommend that the leave allowances sanctioned for officers of the Indian Civil Service and for Military officers subject to the Civil leave rules will be made applicable to Civil Engineer officers of the Public Works Department.

(2) *Grant of furlough.*—The proposals for simplifying the rules in the Civil Service Regulations regarding the combination of various kinds of leave, as well as the leave rules for the European services which the Government of India have had under their consideration and which were sent to the Government of Bengal with Government of India, Finance Department letter No. 538 C.S.R., dated the 18th September 1912, for an expression of opinion, may be given effect to.

(3) *Privilege Leave.*—Under the present rules an officer can earn privilege leave to the extent of one calendar month for every eleven complete calendar months of duty, and such leave is cumulative up to a period of three months. In the case of officers who have accumulated the full period, it frequently happens that the exigencies of the public service prevent them being granted privilege leave when they desire it, and this leads to the leave lapsing through no fault of their own. It would in a measure mitigate against this loss of leave on full pay which an officer has fairly earned, if the cumulative period were extended from three to six months.

An officer should be allowed to avail himself of all privilege leave due to him immediately prior to retirement, and be permitted to retire from the service at the end of his leave, without having to return to duty, as he is now obliged to do. This concession has already been made where privilege leave is combined with other leave.

(4) *Study Leave.*—Modern Civil Engineering is a highly specialized profession and progress in the methods of construction is very rapid. Engineers can only keep themselves abreast of modern engineering practice by visiting and studying works of special interest in progress in different parts of the world. The majority of Civil Engineers serving in the Public Works Department who wish to visit works have to do so as private individuals and entirely at their own expense unless they are placed on deputation, or are specially permitted to visit certain works when on leave. In the latter case certain travelling and other expenses are allowed, but the time spent in the visits counts against the officer's period of leave. It is to the interest of the Government of India to encourage officers to visit such works, and rules should be introduced to admit of facilities being granted or that there should be a much more liberal interpretation of the present rules regarding placing an officer on deputation. In the Indian Medical Service study leave is granted in England up to one year out of total service in addition to furlough, and during this period he receives furlough pay and lodging allowance.

71,833. **(VI.) Conditions of Pension.**—The greatest grievance of Civil Engineer officers of the department and one which is severely felt is the inadequate retiring pension to which they become entitled under existing rules. Many efforts have been made, spread over a period of 40 years or more, to obtain amelioration in this respect, but the net result has been that the present pensions are actually less than they were 40 years ago, when the qualifications demanded from men joining the service were not as high as they are now and when the cost of living was considerably less. Numerous memorials on this subject have been submitted since 1907, and the reply of the Government of India to these memorials is contained in their letter No. 942E, dated 30th August 1912: "That no decision could be arrived at pending the receipt of the report of the Royal Commission on the Public Services in India." It is therefore to the Royal Commission that the Civil Engineer officers now look for redress of this long standing grievance, and it is strongly and respectfully urged that the scale of pensions prayed for in the memorials of 1912-13 be recommended.

(2) This grievance concerning pensions was brought prominently to the notice of the Government of India in the memorials of 1907-08, to which no reply was vouchsafed until August 1912; and as in the meantime a number of officers affected have been placed on the retired list, and many more will probably be required to retire before a decision is arrived at, any improvements made in the scale of pensions should have retrospective effect, at least from 1908.

(3) *Invalid pensions.*—Prior to 1884 invalid pensions granted to Civil Engineer officers on the Imperial list were governed by article 474 of the Civil Service Regulations, which also governs the pensions of all officers of the uncovenanted services as then termed.

In Lord Kimberley's Despatch of 1883 a new scale was introduced for Imperial Engineers and Telegraph officers with a view to ameliorating their conditions of service; this scale is covered by article 641 of the Civil Service Regulations. Under this article the scale has been increased from $\frac{12}{60}$ths of average salary for ten years' completed service, $\frac{13}{60}$ths for eleven years and so on to $\frac{30}{60}$ths for ten years, $\frac{31}{60}$ths for eleven years and so on, but at the same time the maximum limits have been reduced from those allowed by article 474. It is urged that article 641 should be revised so that the maxima limits may agree with those allowed by article 474.

(4) Unlike the Indian Civil Service and the Military Services in India, there is no official Family Pension Fund for the Public Works Department. The emoluments of officers in the department are not sufficient to admit of their making adequate provision for their families should they die in harness; this is a constant source of anxiety to many officers, and they have the additional anxiety of knowing that their pensions are purely personal and cease with their death.

It is strongly urged that a family pension scheme should be started; the majority of men would be willing to contribute a percentage of their salaries towards such a pension fund. Pension has been officially defined as deferred remuneration, which means that a certain portion of the salary which would have been paid to an officer, had there been no pension attached to his appointment, is kept back to provide for a pension on his retirement. This view is corroborated by the fact that when an officer is transferred on foreign service he is made to contribute towards the cost of his pension at the rate of one-sixth of the pay he would have received had he remained in the service of the Government of India. It may be presumed, therefore, that an officer only receives six-sevenths of the pay he would have received had there been no pension to provide for, and that one-seventh is kept back by Government as an officer's contribution towards his pension fund. If the officer had the option of investing this amount to provide for an annuity with a private Insurance Company, he could probably so arrange the terms that a portion of his annuity would be assured to his widow or other members of his family should his death take place within a certain number of years from the date his annuity fell due, with the additional security that his family would be covered against the risk of his death should it take place during the time he was subscribing to his annuity, on the guarantee of a considerable sum of money.

If some such scheme could be worked out by Government on an actuarial basis a large number of officers not only in the Public Works Department but in other services similarly unprotected would be glad to avail themselves of it and to subscribe towards the extra cost.

(5) There should be one set of leave and pension rules for all Civil Engineer officers on the Imperial list recruited under the present regulations.

71,834. **(VII.) Such limitations as may exist in the Employment of Non-Europeans and the working of the existing system of division of Services into Imperial and Provincial.**—It is felt that the European element must largely preponderate to admit of a high standard of efficiency; the number of appointments to the Imperial Service which may at the present time be reserved for Indians is 10 per cent.; this number should, it is considered, not be exceeded at present.

(2) In the interests of efficiency it is felt that the proportion of Imperial Engineers in the service should for the present be not less than 66 per cent.

(3) It is agreed that Engineers of the Imperial and Provincial Services should be borne on the same list, but it is felt that the principle laid down in Article 85 of the Civil Service Regulations is fair and equitable, *i.e.*, that an officer serving in his native land should get only two-thirds of the pay he would draw when working outside his native land. It is an economic fact that imported labour has invariably to be paid more highly than home labour, and there is no reason why India should pay the same for her home-born Engineers as the Secretary of State has to offer to the pick of English Engineers in order to induce them to serve in a foreign and distant clime.

The Englishman serving in India is not working under the same condition as the Indian, inasmuch as he cannot live so cheaply, and is exposed to adverse climatic conditions. He has also to bear the expense of long and expensive journeys home periodically for himself and for his family. Education of his family in England costs considerably more than education in India.

The scale of pay laid down for the Provincial Service is undoubtedly sufficient for the pure Indian, and certainly attracts Indians of high attainments.

71,835. **(VIII.) Relationship to the Indian Civil and other Services.**—The relationship as existing between the Public Works Department and other services in India is satisfactory and should remain unaltered.

71,836. **(IX.) Any other points within the Terms of Reference to the Royal Commission not covered by the preceding Head.**—*Travelling Allowance.*—It is desired to bring to the notice of the Commission the inadequacy of the existing travelling allowance rules in the cases of transfers. It is believed that this question was under the consideration of the Government of India some seven years ago, and would suggest that the question be again considered with a view to the present rules being made more liberal.

General Provident Fund.—The interest on account of a deceased depositor ceases from the date of tender of payment to the person legally entitled to receive the balance at credit of the account. It frequently happens that from inexperience and other causes it is inconvenient to draw the amount immediately on tender of payment being made. It is therefore suggested that it should be permissible for the balance at credit of the account to remain for a reasonable period after tender of payment has been made and to continue to draw interest during that period.

Mr. F. A. A. Cowley called and examined.

71,837. (*Chairman.*) The witness said he was a Superintending Engineer in Bengal, and that this was his 24th year of service. He represented the whole of the European Imperial Engineers in Bengal, and the views in the written statement expressed the opinions of his colleagues.

71,838. The present system of recruitment to the Imperial Service was generally satisfactory, and recruitment should be limited to candidates who had resided at least five years in Europe; but he did not suggest the five years' limitation for the purpose of disqualifying Indians from recruitment in England, because he believed that some Indians who went to England stayed more than five years at the present time. Five years was the lowest period, as the general education would take up one year, three years would be spent at an Engineering College, and one year at practical work. He had no knowledge whether all the Indians now recruited by the Secretary of State had resided in England for five years, but thought the majority of them had not.

71,839. If the present mandatory rule of 10 per cent. for recruitment in England was retained with the limitation he had suggested, he thought in future there would be a chance of obtaining more efficient Indians than were obtained at present. In the course of time more Indians would go to England for their education, and go for longer periods. The Institution of Civil Engineers had laid down a certain minimum which they considered necessary for the technical education of an Engineer, and that minimum was considerably over five years. Three years at a college and one year's practical training were essential. The ordinary Indian's primary education had not been up to the standard of the British school boy, and therefore he required a certain amount of general education before his Engineering College training. He laid importance on candidates possessing degrees recognized by the Institution of Civil Engineers as qualifying for their Associate Membership. At the present time in Bengal there were very few who were A.M.Inst.C.E.'s, and he wanted them all to have the Associate Membership.

71,840. The general idea in the service was that competition would be effective if combined with selection. He was against probation for Imperial Engineers in India, but insisted on a year's practical training in Europe in that branch of engineering which the recruit took an interest in. A man who was fond of mechanical work should go to workshops, one fond of civil engineering should be employed on drainage-works or water-works, and an officer whose bent was building work should be placed under building contractors. He would ask the men to carry out their work in India as they had seen it carried out by contractors at home, subject to the modifications due to local conditions. The year's training should be given to them before selection.

71,841. He favoured a central college in India in order that candidates for the Provincial Service might be trained in this country. They were now trained at Sibpur in the same class as subordinates, and that he regarded as objectionable. For the Provincial Service the candidates should be selected for the college and a qualifying examination should be held. In his written statement he had said that selection should be followed by a competitive examination, but he preferred to substitute for that a qualifying examination. A man would have to satisfy the examiners that he was sufficiently educated to undergo the training given in the college. If there were 50 candidates for 30 appointments the qualifying examination would simply mean that the first 30 men selected would go into the college. It was really competition combined with selection, but he would not make the examination a hard one. Each province would have its own candidates, the college being merely centralised for purposes of economy and efficiency.

71,842. He had no objection to abolishing the titles of Imperial and Provincial, provided the pay of officers was proportionately raised.

71,843. The witness agreed that a foreign service allowance was necessary for Europeans serving in India, but did not admit that this was the only reason for increased pay. A public school education in England followed by a university or college education gave a greater guarantee of obtaining men of character, with administrative integrity and ability and moral courage, than was obtained by the present system of education in India. Therefore the Government obtained a better bargian in the first instance. He would make no distinction whatever between one race and another; if an Indian had had a form of training which produced the necessary qualities he should be eligible for the higher pay. He did not agree with the principle that assuming equality of efficiency the European serving in India should be allowed something of the nature of a foreign allowance on account of the fact that he was serving outside his own country. The pay should be the same for the Imperial Engineer whether Indian or European.

71,844. Some sort of family pension fund should be established which would be acceptable to Government officers. He himself desired to have a family pension fund with a contribution and guarantee from Government in addition to the existing pension fund. He saw no reason why a man should not submit to a compulsory deduction of a percentage of his pay towards the fund. He did not want Government to subsidise the provident fund, which should remain as at present. A man now put so much of his pay into the provident fund and Government gave him 4 per cent.

compound interest on the money. His own proposal was that in addition there should be a family pension fund, such as that in the Indian Civil Service, worked out on an actuarial basis, in order to enable men to make the necessary provision for their wives and families. The provident fund was only a slightly better investment than Government paper.

71,845. Under the present system of salaries and pensions 20 years' service was not too short for optional retirement, and there would be great resentment in the department if the 20 years' rule was abolished. The pension at 25 or 30 years was so low that it was sometimes not worth a man's while to stay on to obtain the small addition to what he would get after 20 years' service. He did not think the 20 years' rule had a tendency to induce the most capable men to leave the service, because men became so wrapped up in their work that often they did not want to leave it. It afforded an opening, however, for a good man to leave, and that no doubt was injurious to the service. He would rather see greater advantages offered to officers to induce them to stay on for the full time.

71,846. (*Sir Murray Hammick.*) The witness said he might have applied to become an Associate Member of the Institute of Civil Engineers at the age of 20, when at Coopers Hill, without passing any further examinations.

71,847. With regard to paragraph 71,831 (5) of his statement, the witness said that in Bengal there were two Chief engineers, and he did not see how it was possible to differentiate between their responsibility or their work. The sole difference was that one was a junior man and the other a senior man, and he urged that the number of appointments was so small that the pay should be the same.

71,848. An officer only received at present six-sevenths of the pay he would receive were there no pension to provide for, and Government therefore was retaining one-seventh of his pay. The officers were willing to subscribe any reasonable sum the Government of India asked them to subscribe to a family pension fund. The pension now died with the officer, and therefore Government should contribute something towards the widows and families; and he asked that Government should contribute to the family pension fund as they now contributed towards the Indian Civil Service Fund. He would be perfectly willing to see Government do away with the provident fund and substitute for it a family pension fund, but the retention of the provident fund was not much of a charge on Government. The officers wanted some form of family pension fund whether a contribution was made by Government or not. He would like to see a family pension fund in addition to the present provident fund.

71,849. (*Mr. Abdur Rahim.*) If every candidate for admission to the Imperial Service had passed the examination of the Institute of Civil Engineers or held a diploma carrying the privilege of exemption to that examination, it would prevent influence from outweighing other considerations in selection, and would equalise the provisional qualifications required. It was a fact that some diplomas of the English colleges were much more easily obtained than others.

71,850. High engineering skill was not required to maintain a building or a road, but he was not prepared to admit that there were a good many subdivisional charges in which only that kind of work was performed.

71,851. (*Mr. Madge.*) He saw no objection to placing the key to the door of a public service in the hands of a body like the Institution of Civil Engineers.

71,852. If a temporary Engineer of 35 years of age was brought permanently into the department, he would block promotion and this would create discontent.

71,853. Officers had occasionally asked for permission to visit works, but he did not think any memorial had been placed before Government on the subject of study leave.

71,854. Members of the service would be quite willing to see any deserving officer promoted to any rank for which he was qualified. In Bengal there was no feeling that only European officers of a certain standing should be promoted to high administrative rank.

71,855. (*Mr. Macdonald.*) The witness said that supposing it was decided to dispense with the services of every member of the higher ranks of the engineering staff who was not an Associate of the Institute of Civil Engineers, practically all the Engineers would be affected in Bengal. There was not a single European amongst them who was not qualified at the time of passing out of Coopers Hill to become an Associate Member without further examination, had formal application been made to the Institution. Therefore, the effect of carrying out the proposal would in a great many cases be purely formal.

71,856. Pay in the public services should depend both upon training and upon work. When appointments were originally made, it was impossible to say whether a man was going to turn out an extraordinarily good Engineer or a very bad one; but the English public school and university and college training was such as to give greater guarantees that a man would turn out well, and therefore to some extent the pay ought to depend upon training. On the whole he thought the average English-recruited Engineer was slightly superior to the Indian-recruited Engineer, the technical education in England being on a higher scale. He had not had experience of picked Rurki men, but had had experience of men who had failed to obtain Government appointments.

71,857. (*Mr. Fisher.*) A man who had taken a first-class in the mechanical science tripos at Cambridge would have passed an examination which, though not identical with the examination for the Associate Membership, would be accepted by the Council of Civil Engineers as equivalent, and certainly such a man should be employed in the service. He wanted some assurance that only men were admitted who passed examinations which would be regarded by the Council as equivalent, because his information was that all the degrees referred to in the regulations did not carry with them the privilege of exemption from examination for admission to Associate Membership. The clause at the end of the list of degrees,—"any other degree of a University in the United Kingdom which may hereafter be recognised by the Council of the Institution of Civil Engineers as exempting from passing for Associate Members"—certainly seemed to imply that all the degrees were accepted; but his information was that that was not correct. To become an Associate Member a man must not only have passed the examination for the Associateship, or an examination recognised as equivalent, but must have also had some experience of practical work. In his time that rule did not apply. He admitted that the insistence on the Associate Membership as such might bar the selection of a very brilliant man who has obtained the highest Engineering honours at a university and might also bar a very brilliant young Indian student. He had not said, however, that all officers should be Associate Members but that only degrees recognised by the Institution of Civil Engineers as qualifying for Associate Membership should be accepted.

71,858. (*Lord Ronaldshay.*) The witness said that the system of annual increments should not extend to the administrative ranks, because when a man had reached administrative rank he required a certain substantial promotion, as his responsibilities were trebled or quadrupled.

71,859. (*Mr. Green.*) The point he wished to make was that Engineers ought to have a family pension fund which was guaranteed by Government. The Uncovenanted Service Family Pension Fund is not so guaranteed.

71,860. (*Shashi Bhushan Mazumdar.*) The witness did not consider that the fact that practical work in England was carried out by contracting firms by means of labour-saving appliances at all militated against an English training, because labour-saving appliances were being introduced into India at a very rapid rate.

71,861. He did not propose the same responsibilities and the same standard of education for Imperial and Provincial Engineers.

71,862. Privilege leave might be taken without limit, and the same rules should be applicable to Indians and to Europeans.

71,863. The witness said he was fully aware of the heavy expenses entailed upon Indian officers by the family system. He was not aware that Provincial Engineers were frequently earning much less than some of their junior class fellows who entered other departments. His only experience was that of an Executive Engineer and a Collector of a district, and in that case the Executive Engineer was drawing more pay than the Collector. But in this instance the Executive Engineer, although an Indian-trained officer, was an Imperial Engineer.

71,864. There were heavy divisions in Bengal for which European Engineers were more fit, but he did not think it possible to redistribute the divisions so as to make them practically equal. The work to be done in them varied from year to year, one year being light and another year heavy.

71,865. The present scale of travelling allowances on transfer was a crying injustice.

(The witness withdrew.)

Shailendra Nath Banarji, Esq., Under-Secretary to the Government of Bengal in the Irrigation and Railway Branches.

Written Statement relating to the Public Works Department.

71,866. Referring to the statement by the Indian-trained officers of Bengal dated 2nd April 1913, a copy of which is attached hereto (Annexure A, paragraphs 71,874-80), I generally agree with its conclusions. But I would venture to put forward a few personal opinions on the several points raised.

71,867. **(I.) Method of Recruitment.**—The existing method is described in the statement referred to above.

Imperial Service.—I do not consider the present method of recruitment as satisfactory as it used to be before the abolition of the Cooper's Hill College. It is very probable that present recruits from English Colleges get higher training in the mechanical branch of Engineering and are afforded better facilities of seeing extensive engineering works, but the standard of training in Indian Colleges appears to me more suited to what is required of Engineers in the Public Works Department in India. It may be urged that for works requiring special engineering skill, like the construction of the Lower Ganges bridge, the services of specially trained men in English Colleges are required, but it is open to doubt whether for running the formulated routine of the Public Works Department, men with special branches of engineering training are at all indispensable.

I am of opinion that for recruitment from England the present system of selection should be supplemented by a competitive examination between the nominated candidates, this examination being on the lines as suggested later on for the selection of superior engineer officers from India.

Provincial Service.—The present method appears defective for the following reasons:—

(i) Want of open competition from students all over India.

(ii) Want of special training to qualify the candidates for the particular duties they have to discharge in service.

(iii) An uniform method of training to turn out officers and subordinate classes. This is a very serious drawback.

My suggestions for improvement would be as follows:—

(1) Indian Engineering Colleges should have a theoretical and practical course extending over three years to be terminated by a final University examination. The result of this examination will qualify men for the so-called Provincial Service, members of which are proposed to be designated Deputy Engineers (*vide* Annexure A) after one year's practical training.

(2) Out of these passed students a number equivalent to double the number of requirements in the Superior Engineer Service (proposed to be designated "Indian Engineer Service") for the particular year, should be picked up and given a further training of two years in a Central College for all India. The appointment in the Superior Engineer Service should then be made as a result of competition in the final examination of this College. The men so appointed should not require any probationary period, but will have to pass the prescribed Departmental examination within three years of their appointment.

Those who fail to compete in the examination mentioned above should be given preference in appointments in the District Boards, Municipalities and guaranteed Railways.

Regarding the percentage of appointments in the Superior Engineer Service from English and Indian recruits, I would urge that 50 per cent. of the appointments should be from India, and the proportions should gradually increase as conditions change. The Commission of 1886 was appointed to devise a scheme for doing full justice to the claims of natives of India to higher and more extensive employment in the public service. The Government of India have always held that it is necessary to throw open a larger number of appointments to Indians in order to redeem to the utmost extent the pledges of the British Government to employ natives in the several departments in the service of the State. The outcome of the recommendation of the Commission was quite the reverse, and the number, pay and prospects of the higher Engineering appointments were substantially reduced instead of being increased as was anticipated. A retrograde policy like this may be guarded against.

71,868. **(II.) System of Training and Probation.**—This has already been dealt within paragraph 71,867. I would now like to add the following. One year's probationary period in England to qualify for the superior Engineer Service has been suggested in the memorandum by the Indian-trained Engineers of Bengal. But I am doubtful whether this is indispensable. Although caste prejudices in this country are gradually but very slowly dying away, it would be a considerably long period before the shackles are entirely cast off. And I am sure that the idea of a voyage to England will seriously hamper the progress of a very intelligent section of orthodox Indians in their attempt to achieve an Engineering career in the service of Government, and perhaps the State will lose some very capable Engineers of talent owing to this barrier being put in.

71,869. **(III.) Conditions of Service.**—I fully agree with the observations made under this subhead in the memorandum attached (paragraph 71,876).

71,870. **(IV.) and (V.) Conditions of Salary and Leave.**—I have no fresh observations to make except what I said about leave in my memorandum dated 20th February 1913 (Annexure B—paragraph 71,883).

71,871. **(VI.) Conditions of Pension.**—I would add the following. With the reorganisation of pay and prospects of every branch of service, the Exchange Compensation allowances have ceased. But these allowances in case of pensions drawn have not been discontinued in the case of European officers, thus giving them a higher rate of pension than drawn by an Indian officer for the same amount. There ought to be uniformity in this.

I do not agree to any difference being made in the scale of pension drawn as suggested in paragraph 71,879, and would urge that it should be the same for European and Indian.

71,872. **(VII.) Such limitations as may exist in the Employment of Non-Europeans and the working of the existing system of division of Services into Imperial and Provincial.**—I fully concur with the observations made in the memorandum attached. I would, however, add the following. As urged before, the department should be recruited half from England and half from India. In both these cases, the recruitments should be open to all British subjects equally, irrespective of domicile, caste, colour or creed.

The division of the Public Works Department into Imperial and Provincial sections has been anything but a success, and has created constant heart-burning among the Provincial officers, who do exactly the same work and bear precisely the same responsibilities as their Imperial brothers. This is not at all analogous to the Civil Service, where the Imperial and Provincial people have altogether different duties to perform. This division of services in the Public Works Department has intensely been resented, and has already resulted in splitting up the whole Public Works Department into two hostile camps, and this must greatly injure efficiency.

It is only proper and just that same value has to be paid for the same type of work, and it should be no consideration that a certain class of workmen may have greater individual needs. The remuneration of the Justices of the High Court and Members of the Executive Council of His Excellency the Governor afford excellent examples of the spirit of Government in this matter. Again, there are examples of English-trained Engineers who, article for article, compare unfavourably with the average Indian-trained Engineers in the matter of efficiency. It is, therefore, urged that the differentiation which is illogical and unjust should be obliterated and extinguished and that the Indian Colleges should be restored to the position they formerly occupied when the training imparted in them was as fruitful as to turn out half a dozen of Chief Engineers and several administrative officers.

71,873. **(VIII.) Relations of the Service with the Indian Civil Service and other Services.**—I am not quite sure whether the relations between the Public Works Department and the Civil Service do not admit of improvements. As an Indian member of the former service I can say this much from personal experience.

It would, I think, not be out of place to mention here that I have had occasion to feel the want of proper recognition by the Civil officers.

ANNEXURE A.

Memorandum dated the 2nd April 1913, by the Indian-trained Engineer Officers of Bengal.

71,874. **(I.) Methods of Recruitment.**—In Bengal the system of recruitment of Indians and Indian-trained Engineers is as below:—

A.—Imperial Engineers.—Indians appointed by the Secretary of State by nomination from England beginning on Rs. 380 and on the same conditions as Europeans except leave and pension rules. The maximum number of Indians so appointed is limited to 10 per cent. of the total number of appointments made by the Secretary of State. The numbers of officers so appointed in Bengal and the three other Provinces of Bihar and Orissa, Assam and Burma, since the rules came into operation five years ago, compared with the total of officers so appointed, are—

	Number of Indians.	Total number of officers appointed.
Bengal	Nil	9
Bihar and Orissa ...	1	7
Assam	1	5
Burma	Nil	19
Total	2	40

The statement shows that only 5 per cent. has been appointed, though the permissible limit, 10 per cent., in itself was small enough. The number of Indians appointed by the Secretary of State was small enough. The number of Indians appointed by the Secretary of State should be increased, and the limitation of 10 per cent. is too small and it should be raised to 50 per cent. The method of selection of candidates by nomination is not considered satisfactory. Selections should be made by an open competitive examination as in the case of the Indian Civil Service.

B.—Provincial Engineers.—(1) One appointment every year from the Sibpur College. This selection is made from Engineering graduates of the Calcutta University. After graduating, the candidate undergoes a year's practical training in the Department and a second year's apprenticeship and is then appointed on Rs. 250.

(2) One in alternate years selected from deserving upper subordinates. The Provincial Service was introduced to throw open a larger number of the less important appointments to Indians as recommended by the Public Service Commission of 1886. The exact way in which this will be effected was not noted, but it appears that it was probable that the intention of the Commission was to introduce a Provincial Engineer Service analogous to the Provincial Civil Service. The Service introduced is quite different. The Provincial Engineers serve side by side with Imperial Engineers with the same responsible duties, except that the pay is less. This system has created great dissatisfaction, particularly at the present time, when the conditions of education in India and in England are equal, the advantage in favour of European education referred to in 1886 having disappeared now. A comparison of the syllabus of study undergone by the Calcutta graduate will show his advantage over the candidates eligible for nomination for the Secretary of State's appointments, except that the after-College training in certain branches in England is superior, the opportunities of studying Engineering works of higher order being greater. The efficiency of the Indian training is also proved by the fact that just at present three of the ablest Chief Engineers are from Indian Colleges. It is, therefore, urged that all appointments to the superior Engineering Service should be on the same pay, whether appointed in England or in India, and the Provincial Service abolished. It has been felt by the existing Provincial Engineers that from the small pay it is difficult for them to maintain their position in society commensurate with their rank. In the Indian Civil Service the pay is high and a Statutary Service $\frac{3}{4}$rd pay was possible, but the pay of Engineers being much smaller, a reduction of $\frac{1}{3}$rd of pay slices off funds for necessities.

Coming next to the question of the number of Indians appointed, it will be seen that in 1886 the cadre of Engineers was—

India	834
Madras	87
Bombay	94
Total	1,015

Barring special appointments, it was then calculated that 30 Engineers' appointments will be necessary. The Government of India decided that these 30 appointments should be alloted to—

Royal Engineers	6
Cooper's Hill Engineers	15
Indian College Engineers	9
Total	30

That is to provide ultimately $\frac{30}{100}$ × 1,015 or 303 Indian-trained Engineers. The cadre has increased since 1886, and the rules for recruitment have been in operation for 27 years, but the number of appointments of Indian Engineers is now only about 250, which shows that in this case also the permissible minimum has not been worked up to. The number of Royal Engineers recruited have been reduced and Cooper's Hill College abolished; at the same time training in India has improved. It is, therefore, very desirable that a larger percentage of appointments be thrown open to Indian-trained Engineers than in the past. The number we propose are based on the following rough figures. The cadre of regular Engineers is now assumed to be 1,050. This number should be reduced to, say, 1,000 by a redistribution of charges which can be effected if all the subdivisions are manned by graduate Engineers (trained in Indian State Colleges) of the Deputy Engineer class which we propose later on. The Executive Engineers will be relieved of going into minute details which they have to do now in case where a less qualified man is in charge, as it is in some cases at present, and their jurisdiction can then be increased. Of the remaining 1,000 appointments, 100 of the less important charges

may be listed for deserving members of the proposed Deputy Engineer class, the balance of 900 to be regular Engineers of the superior service. It would be fair to reserve 50 per cent. of these appointments for Indian-trained Engineers, this being on the basis of redistribution which was the intention of the Government of India, except that the number allotted for Royal Engineers, who are not appointed now, being given to Indian College students, the number being 9+6 or 15 out of a total of 30 annual appointments. This would mean 450 appointments for Indian College men, and for this ultimate number 450 × $\frac{3}{80}$ or 17 appointments will be thrown open to them annually. The number may be distributed as below:—

Bengal (Sibpur College)	4 (Provinces of Bengal, Assam, Bihar and Orissa and Burma.)
Bombay (Poona College)	3 Bombay.
Madras (Madras Engineering College.)	3 Madras.
Punjab (Rurki)... ...	4 (United Provinces, Central Provinces, Punjab and Railways.)

The remaining three will be reserved for promotion from the proposed Deputy Engineer service. These three total service appointments will afford six appointments being made, as officers will only be selected at about the 16th year of their service, when they have proved their exceptional abilities. These six appointments may be distributed as under:—

Bengal	1
Bombay	1
Madras	1
Punjab and United Provinces ...	1
Bihar and Orissa and Assam	1
Burma and Central Provinces ...	1
Total	6

A saving in establishment charges will thus be effected by a reduction of 15 per cent. of the superior appointments, replacing them by Deputy Engineers on a smaller pay. A saving will also be effected by the replacement of a number of Europeans by Indians in the superior service, on account of the comparatively stringent leave and pension rules and allowances of the latter class. The maintenance of a large European element in the Technical Departments (such as Public Works, Railway, Forest, Telegraph, Medical, etc.) is not demanded for political considerations. In the Medical and other services it has been urged that a war reserve is necessary and Europeans cannot be replaced. In the Public Works Department this even is not necessary, and it is therefore the only department in which a large number of Indians may be appointed without loss of efficiency, and we therefore strongly urge that a substantial larger number of appointments be thrown open to Indians than hitherto.

The selection of this number of Indian-trained Engineers may be by a competitive examination, if possible. If not, these appointments will be made from the results of the final College tests.

The name of the service may in future be the "Indian Engineering Service."

Deputy Engineers.—The proposed class of Deputy Engineers should be recruited solely from passed students of the State-maintained Colleges and no promotion be made to this class from any section where the men are not highly qualified.

Overseers.—The recruitment to this proposed class to replace the lower subordinate class should be from candidates who have passed the Overseer examination of the Technical Board as far as available, the balance being taken up from candidates who have passed the Sub-Overseer's examination after they have completed their practical training.

71,875. **(II.) System of Training and Probation.**—*Engineers.*—The appointments for Indian Colleges will be on probation directly they graduate, candidates being selected in the order of merit in a competitive examination, or if that be not feasible, by the results of the final examination. One year's practical training in England would be desirable and should be insisted on, and this would be in the probationary period. An allowance of £15 per month *plus* passage from and to India to be given to the probationer and he will be appointed as Assistant Engineer on Rs. 380 on production of a certificate of undergoing this practical training as in the case of Engineers appointed by the Secretary of State. No further departmental test should be made, as under the present system, which is undesirable as the higher qualifications are placed at a discount in the hurried test in minor and less important subjects. This is not the real guide to the test of an Engineer of higher qualifications. If necessary, further practical examinations may be introduced in the College course, though the latter, we presume, will not be necessary, as the University Act of 1904 now provides these, and candidates for 1912 onwards have passed through this standard.

The age at which a Sibpur College student now qualifies for service is very advanced. It is desirable to reduce this and we append a note to this memorandum showing what it works up to now and what we propose.

Deputy Engineers.—These officers should be appointed after undergoing a year's approved practical training in India, Public Works Department, after graduating. An allowance of Rs. 100 per month will be given to them during the probationary period, they being confirmed in the 6th grade at the end of this term. No difference in the scale of allowances should be made as at present between Europeans and Indians, as this distinction in the beginning of a young man's career has a very deleterious influence, creating a feeling a diffidence and inferiority. A further care is necessary to secure that they are not huddled up with the non-qualified Overseer passed students as at present. No further departmental test should be made for selection for the same reasons as given for Engineers.

Overseers.—The present system is satisfactory and should be maintained except that they should not be put in practical training together with the graduate students. Deserving senior Overseers will be promoted to the Deputy Engineer class on the supernumerary list with honorary rank.

71,876. **(III.) Conditions of Service.**—The superior Engineering service should be the same and no distinction made between Indians and Europeans. The existing Provincial Service should be abolished as already urged above.

For the larger number of highly qualified Engineering graduates turned out from the State Colleges, the introduction of a suitable service is necessary. At present those that fail to secure appointment as an Engineer are appointed as upper subordinates. The nomenclature is unhappy at present as the majority of these men are now graduates who have undergone a very complete and stiff course of study in a scientific subject. The last Public Service Commission recommended a Provincial Engineering service for less important posts. We presume the intention was to introduce a service which would be in its relation to the Engineer Service as the Provincial Civil Service is to the Indian Civil Service. This should be adopted and a Deputy Engineer Service introduced to replace the existing Upper Subordinate Service. The course of study undergone by an Engineering graduate is far more difficult and extends over a longer period than that of a candidate for the Provincial Civil Service. The status and pay of the Deputy Engineer Service should therefore be analogous to those of the Provincial Civil Service officers.

The existing lower subordinate class should be abolished for similar reasons, the course of study now undergone by them having been thoroughly improved. This class should be replaced by "Overseers" as proposed.

71,877. **(IV.) Conditions of Salary.**—For Engineer officers no difference; the pay as at present.

For Deputy Engineers to replace present upper subordinates, the service will be manned by Engineering graduates, who are highly qualified. The present ones have proved to be a very efficient set of officers who have raised the prestige of the service. The

examination of the records of any office will show that the intricate calculations and estimates of important projects are mostly prepared by this section of useful Government servants. Their pay is, *primâ facie*, inadequate and there is naturally a dissatisfaction. This has been recognised by Government, but the remedy proposed by some officers was worse than the disease. It was, that the College which turns out these highly qualified men be abolished. As Government does not and cannot accept this view, the College has to continue. It is necessary, therefore, to increase the pay and prospects of this body a little higher and we propose the following scale. The present rates of pay for this as also of the lower subordinate class was fixed long ago, and though the pay of the superior Engineers has been increased in the meantime, and stagnation of promotion removed, nothing has been done for this needy class:—

	Pay per month.	Percentage of appointments to total cadre.
	Rs.	
1st	500	20
2nd	400	20
3rd	300	15
4th	250	15
5th	200	15
6th	150	15

Of late graduates have not been eager to accept these appointments owing to rise in prices, which precludes anyone entering on the pay now offered, but with the increased pay as proposed they will be induced to do so. With these efficient and reliable officers of higher moral tone in charge of subdivisions, the Executive Engineer will find relief and be able in his turn to hold bigger charges. At present the promotion of upper subordinates is slow, and this has been further retarded by appointments from time to time of outsiders to the higher grades. This should be stopped, save in very exceptional cases.

One hundred listed appointments as Executive Engineers to be reserved for the senior Deputy Engineers, and six appointments made annually to the Indian Engineer Service from Deputy Engineers of proved ability.

Deputy Engineers in charge of subdivisions should be allowed rent-free quarters as in the case of Provincial Civil Service officers in charge of subdivisions.

Overseers.—This service is proposed to replace the present lower subordinate class as already noted above. The standard of education of subordinates employed has risen much higher since the service was introduced. The cost of living has increased in the meantime about 100 per cent. The Government of Bengal have considered the question of raising their pay, and in Bengal Government Resolution No. 1670 E., of the 30th May, 1910, a number of appointments as Overseer, 3rd grade, has been reserved for the students who have passed the Overseership examination of the Joint Technical Board. This has not been found to be a remedy, rather the reverse, as it has only created dissatisfaction amongst graduates with whom they are trained on equal terms and then examined in simple practical tests in minor subjects, simply because the Overseer students are innocent of the higher subjects. The bulk of the passed students has to enter on Rs. 40 and finish their career on Rs. 70 per month. The promotion is very slow. It is not possible to live on this pay at the prevailing high prices for a married subordinate, who has in a transferable service to live away from a cheap joint family, and also to do touring work entailing a double set of servants. It may be possible for a year or two to do so living without one's family with him, in fact leaving them to be maintained by other relatives, but this arrangement cannot continue for long. The result is that the honest and good leave the service, and the undesirables stick on. The temptations to a Public Works subordinate are as manifold as in the Police, and as has been accepted for the latter Department, the pay and prospects of the lower subordinate require an increase, if the moral tone is to be improved to the interests of Government. We would, therefore, propose that the present lower subordinate establishment be replaced by "Overseers" and the pay fixed as below:—

	Proposed pay per month.	Percentage of appointments to total cadre.
	Rs.	
1st	100	10
2nd	85	15
3rd	70	15
4th	60	20
5th	55	20
6th	50	20

Two special increments of Rs. 10 each may be given to deserving men of the 1st grade.

Deserving subordinates of exceptional ability to be promoted to Deputy Engineer grade to the extent of 5 per cent. of the appointments of Deputy Engineers.

Free quarters should be provided to these officers, and where no Government quarters are provided, a suitable house-rent allowance to be given. At present free quarters are provided in many cases, and this proposal will not increase the cost much.

The conveyance allowance of the Upper and Lower Subordinate Services requires revision owing to enormous rise in wages and prices of food stuffs. Rupees 15 monthly for the upkeep of a pony, as now allowed, is insufficient.

The daily allowance of officers of the Engineer Department should be increased by 50 per cent.

71,878. **(V.) Conditions of Leave.**—For short leave and leave on urgent private affairs, the rules, which are the same in case of Europeans, are fair, but the latter leave may be granted to Indians in instalments. As regards furlough, the proposal now under consideration of the Government of India will suit, except that the proportion of furlough should be one-fifth of service as against one-fourth in case of Europeans to enable the full amount of five years' leave being enjoyed in a service of 30 years.

Study leave to Europe, Egypt and America should be allowed to Indians on favourable terms to encourage them to visit Engineering works in those countries. Such leave to be on three-fourths of pay, subject to a maximum of £40 per month and a minimum of £25 per month. It should preferably extend to four months at a time at intervals of not less than six years. Not more than two such leave should be allowed to an officer in his total service. A report of works visited by him to be furnished to Government.

The Department has been deprived of the privilege of leaving head-quarters on holidays under the Negotiable Instruments Act. This privilege should be allowed to officers of the Public Works Department as far as possible. Even the Magistrates and District Judges are allowed to go away during Christmas and Puja holidays, making temporary arrangements for urgent work, but the Public Works Department is the only Department from which the privilege has been withheld.

71,879. **(VI.) Conditions of Pension.**—Pension of Indian Engineers and subordinates to be on the same graduated scale as for European officers, except that the fraction in the case of Indians to be reduced to $\frac{30}{60}$ths, etc., instead of $\frac{30}{60}$ths, etc., as in the case of Europeans. The maximum limit of pension to be raised from Rs. 5,000 to Rs. 7,000 a year. Our reason for these suggestions are—

(1) The average life of Indians, particularly people of Bengal, is shorter than that of Europeans.

(2) Indian-trained Engineers, specially Sibpur College men, enter service at a more advanced age than Europeans. This is due to the inordinately long course of study which extends to five years after the intermediate Engineering examination.

(3) Indian service leave rules being stringent such officers have to stay on actual duty, foregoing the advantages of recouping their health.

(4) Long leave of Indian officers being usually spent in India, the service counting towards pension is much less than that for Europeans of the same record of service.

(5) Indian officers of the Engineer Service are fast adopting semi-European mode of living. This, com-

bined with the demands of an Indian society, in the way of maintaining a large circle of relatives and to find funds for heavy marriage dowries for their children; these combined with the general higher standard of living, run up the total cost of keeping up appearances of a retired officer very high.

Article 649, Civil Service Regulations, regarding the retiring of an Executive Engineer at the age of 50, if he has not attained the rank of a Superintending Engineer, should be abolished, particularly in case of officers promoted from the Deputy Engineer grade.

71,880. **(VII.) Limitation for Employment of Indians.**—The maximum limit of 10 per cent. of appointments by the Secretary of State should be raised to 50 per cent. The low limit was put as it was anticipated that the Department will be swamped by Indians otherwise. Experience shows now that these apprehensions are groundless. About half the number of officers appointed from Indian Colleges, as shown in the Classified List, are Europeans. If the limit of Indians for Secretary of State's appointment is raised to 50, then there will be 50 per cent. of Indians from England and 50 per cent. in India. The number of Indians in the total list will not be therefore more than 50 per cent.

Indian graduates who have specially qualified in special branches of Engineering, such as Electrical and Mining, should be appointed in the Government departments where non-qualified Europeans are now employed. The Electrical Departments of the Local Governments now employ a good number of such officers.

Europeans, indifferently qualified, are employed on Railways in which Government can force a control as these Railways are guaranteed, and they should not employ non-qualified Europeans on a higher pay in preference to qualified Indians who are less costly. This requires the serious consideration of the Government of India as an army of Engineers may be suitably employed on Railways. Indian Engineers have proved their ability and usefulness in the Eastern Bengal State Railway.

For the Engineering Service, it is necessary that Government should make stringent rules for appointment of all the superior Engineers and subordinates in all District Boards and Municipalities, from qualified students of the State-maintained Colleges. Europeans who have qualified to any degree find ready employment in the guaranteed Railways and private Engineering firms which are now mostly owned by Europeans; it is, therefore, very necessary that qualified Indian students from Indian Colleges should receive preference in any department where Government has any hand in the selection. No Engineer's post on a pay of Rs. 200 or above in Bengal, Burma, Bihar and Orissa and Assam should be filled in unless he is an Engineering graduate of the Calcutta, Bombay, or Madras University or had passed the final Rurki Engineering Examination.

71,881. **(VIII.) Relations with the Civil Service.**—Only lately, with the creation of a Governorship in Bengal, the Engineering portfolio has been put in charge of a member of the Civil Service. The arrangement or disposal of business is not known to members of the Public Works Department, but they would suggest that the position of the professional head of the Department is made clear on the point of dealing with technical matters and works.

71,882. *NOTE REFERRED TO IN ANNEXURE A.*

From the Classified List it will be seen that Europeans were appointed at a much earlier age than those recruited from the Indian Colleges, thus a very valuable portion of the lives of the latter officers is spent in the Colleges as well as in training, which could be much better utilized in the service to the best interests of both the Government and the officers concerned. This is not due to any intellectual deficiency on the part of the Indian students, but to the standard required for admission into the Indian Engineering Colleges, as well as the lengthy periods of College course and practical training. A comparison of the systems that obtained in the late Coopers Hill College in England with that of the Sibpur Engineering College in Bengal will show clearly the vast difference in the two systems. To enter Coopers Hill College a student is required to pass a preliminary test. He is then admitted into the College, and on passing the final examination after three years he is appointed to the Public Works Department, India, as Assistant Engineer on Rs. 380. If the students entered at 18 or 19, they got Government appointment generally at the age of 21 or 22. In Sibpur Engineering College in Bengal the minimum educational qualifications for admission as a regular student are that a candidate shall have passed (*a*) Intermediate Examination in Science or Arts of the Calcutta University in English, Mathematics, Physics or Chemistry and (*b*) pass such special test in drawing as may be prescribed from time to time by the Principal; such a candidate must be under 21 years of age. Under the present University Regulations, the minimum age of a student at the time of his admission into the College will be about 19 years. He enters College in the month of July. The College course is for four years with an intermediate University examination at the end of the second year.

The final B.E. Examination is usually held in July. Then the passed students commence a year's practical training under some Public Works Department Engineers some time in the following October. Then after completion of the year's training another examination is held at Purulia in the month of November, and the successful candidate is appointed as Apprentice Engineer in the Provincial Service, some time in January or February. Thus it will be seen that even a very meritorious student, who successfully passes every examination at the first chance, will take nearly six years from the date of entering the College to get an appointment in the Public Works Department, Bengal, as an Apprentice Engineer on Rs. 100. After the probationary period of one year as Apprentice Engineer he is promoted to the Assistant Engineers' grade on Rs. 250, if he succeeds in obtaining a favourable report from his Executive Engineer. The above will show how handicapped an Indian Engineer is, in his official career, compared with his European brother officer. The result is that an Indian Engineer commencing service at the age of 25 or 26 on the lowest pay of Rs. 100 becomes superannuated before his time comes for the higher administrative posts.

Thus it is clear that the fact that only a few Indian Engineers have been able to rise to the administrative rank during the last 50 years is not, in many cases, due to any fault of the officers, but to that of the system of recruitment. It is also disadvantageous to Government, as they get on an average of about 28 years' service from its Indian College Engineers against about 32 from Europeans. Besides, the Government takes Indian-trained men into its service, when a considerable portion of their energies was used up in passing a number of stiff and unnecessarily rigorous tests and examinations. It is, therefore, very necessary that the system of recruitment should be thoroughly changed and simplified according to that followed in Cooper's Hill for so many years with such good results. It would not be out of place here to mention that the rules framed for the proposed Dacca Engineering College in connection with the Dacca University Scheme will make matters much worse. The minimum educational qualification for admission is that the student must pass the I.Sc. Examination. Then the College course is for four years, and then practical training for three years. So a student will be about 27 before he can expect Government appointment.

We would therefore propose that age-limit for admission may be fixed at 19. The minimum educational qualification required for admission will be the passing of the Matriculation in the First Division. With better prospects for the passed students of the Engineering College, there will be a very large number of applications from very meritorious students for admission into the College and the Principal will be able to pick up the best students from the top of the list prepared according to their marks in Mathematics and half the number they obtained in English. Of course each student should produce a health certificate from the College Surgeon and a certificate of good character from the Head Master of his school.

The College course may advantageously be fixed for four years, during which the students should be given both theoretical and practical training in all the branches. The University examination that will be held at the end of the fourth year should also be both theoretical and practical. On the results of this examination, the appointments to the Public Works Department should be made without any further practical training or practical examination. We may also note that facilities should be afforded to the students while in the College to learn riding and cycling, and certificate from the Principal to the effect that the student can ride and cycle will be required before he is allowed to appear at the final examination at the end of the fourth year. The probationary year of the Indian College Engineers may advantageously be passed in England, where they can see large and important Engineering works. By the proposed system we are sure that the Government will find in these new recruits highly trained men both in theory and practice, full of youthful vigour and energy which, with a few years' experience and mature judgment, will make them very valuable and useful officers. These officers will be able to render useful service for a much longer period than at present.

ANNEXURE B.

71,883. *Note by Mr. S. N. Banarji, Under-Secretary, Irrigation Branch, dated the 20th February* 1913.

(1) I am not sure whether the proposed rules do not require much more simplification. These rules are to be applied by petty offices as well, and unless these are framed in the simplest manner possible, difficulties in application may occur.

(2) I would suggest that the amount of furlough earned be one-fifth of active service in order that the limitation to five years can be taken advantage of in a service of average length. Under the one-sixth proportion rule, an officer whose services will extend over a period of 35 years will be able to earn this. Under the rules for European services where the proportion is fixed at one-fourth and the total leave allowed is six years, an officer will be able to enjoy this maximum in a service of 30 years. To enable officers under Indian rules to avail themselves of the maximum of five years in their case in 30 years, the proportion of furlough would have to be put at one-fifth of active service. This latter proportion, I would venture to submit, would be fair.

To simplify matters still more, I would suggest as an alternative one-sixth of total service (not active service). In case of Indian service rules, the term furlough "due" has not been defined. It is presumed that furlough "due" is furlough earned, deducted by ordinary furlough availed, except furlough on medical certificate under proposed Article 320A. This point may be made clear in the rules, as without this there may be a misapprehension that an officer who had the misfortune to be compelled to take leave on medical certificate at the earlier stage of his service will have to work off the leave taken from the furlough which he will earn from active service. I am confident that the intentions of the Government are not to withdraw former privileges, and have therefore mentioned this point with a view that the point may be made clear by a sub-clause. In India the bulk of the Government servants who draw less than Rs. 500 per month cannot afford to take long leave on half-pay and they avail themselves generally when they are incapacitated through ill-health. The provision of three years' sick leave allowable under the old rules, irrespective of the furlough earned, was necessary, and it is presumed that this privilege will not be withdrawn.

(3) If there is no objection, leave on urgent private affairs may be allowed to officers under Indian service leave rules in instalments instead of six months at a time. In case of European officers, the journey to England and back to Bombay takes up about five weeks and is an expensive one; a minimum of six months at a time is necessary in such a case. In case of Indian officers a shorter time will suffice, but being near at hand the occasions for such leave are more frequent. The privilege of taking the leave under proposed rule 321 in instalments will therefore be a great advantage. At the same time, the interests of the service will also be better protected in such a case, as an Indian officer will take the full period of six months if he knows he will not get the balance at a future period, though he may not usually require more than half of it, thus dislocating the work for a longer period, which will otherwise be avoided. Then, again, he may not avail himself of the balance due at all. In fact, it will be an inducement to officers not to take a larger length of leave on urgent private affairs than is urgently necessary.

Mr. S. N. Banarji called and examined.

71,884. (*Chairman.*) The witness said he occupied the position of Under-Secretary to Government in the Irrigation Branch and represented the Provincial Engineers of the Public Works Department in Bengal, 11 in all. He was recruited to the service nine years ago from the Sibpur College. He differed from his colleagues* with regard to certain points in the written statement.

71,885. He agreed that 50 per cent. of the superior service should be recruited in England and 50 per cent. in India, and he proposed the abolition of the distinction between Imperial and Provincial. The proposed Deputy Engineers should take the place of the present Upper Subordinate Service in the sub-divisions. Officers of the superior service would fill some of the sub-divisions as Assistant Engineers. The number of Assistant Engineers would be fixed in accordance with the number of superior vacancies. There should be sufficient assistants in training for superior posts.

71,886. The witness did not agree with the written statement that the age for the admission of candidates to Engineering Colleges should be 19. He thought 17 would be the proper age for admission into an Engineering College. He was in favour of a central college, but desired to restrict it to men in training for the Imperial Service. For the proposed Deputy Engineer Service he suggested Provincial colleges in various provinces. Under his scheme the course for the new class of Deputy Engineers would be three years and for the superior service five years.

71,887. He differed from the view held by his colleagues, because he was in favour of open competition throughout the country, so that men from all the provinces would have a chance of showing their abilities. In the central college there would be an open examination for all India, with no selection. Those who came out at the top of the list, irrespective of the provinces from which they came, should be given appointments in the various provinces. After the results were published an endeavour might be made to allot successful candidates to their own provinces, but if this was not possible he did not think it would matter very much, and it would not cause dissatisfaction if men of one province were appointed to another province. He was in favour of direct recruitment to the superior service, but would reserve a certain number of posts for promoted officers.

71,888. He did not agree that a year's training in England should be given to candidates recruited in India, as this would deter some people from entering the service. If it was decided that a year's training in England was necessary, he would not make it compulsory, but would arrange for it by means of study leave. For Indian engineering purposes there was not much to be gained by going to England.

71,889. He saw no reason for paying the European something in the nature of a compensation allowance for serving out of his own country, but he had no

* 'Colleagues' here means and includes all the Indian college-trained Engineers of Bengal, in which there are a good many Imperial officers as well. The joint written statement was a result of their combined deliberation.

objection to such an allowance so long as the pay *plus* allowance did not exceed the pay of the Indian recruited in India. A European could only expect a foreign allowance over and above what he would receive in England, but not beyond the average of the standard pay of India. He would not himself be prepared to serve in England for the same salary as he would receive in India, but if he found that the standard pay in the service in England was more than it was in India, he should accept that pay and would not demand any foreign allowance. He quite agreed with the general principle that when an officer served out of his own country he should receive a higher salary, and that principle would be regarded as reasonable by Indians if it was made universal throughout the services.

71,890. He was not prepared to accept the opinion expressed by his colleagues that preferential terms of pension should be given to non-domiciled Europeans. Throughout the service the responsibilities were the same, and the Indian remaining in his own country had to maintain the same social status, even after retirement, while the European could return to England and live on a lower status than maintained in India.

71,891. (*Mr. Fisher.*) He entered the college at the age of 19 and found his work at Sibpur College of value: the examinations at the college were not quite easy. The present course at the college lasted about two years longer than the Rurki course and a higher standard of university training was required for admission to Sibpur, he himself having passed the B.A. By lowering the qualifications for entrance to Sibpur just as good Engineers would be obtained, as the earlier a man started the more energy he had. Had he been admitted earlier to Sibpur he would have gone through the examinations with the same degree of ease.

71,892. (*Mr. Madge.*) The witness considered that the education imparted in England was on different lines from that given in India. In England men were educated in workshops, sea protective works, sewage works, etc., whilst in India they were educated in irrigation, canals, navigation works, and so on, and the colleges in India were more suited to education in those subjects. It would be wise to aim at raising the Indian colleges to the highest standard possible in accordance with Indian requirements and Indian conditions.

71,893. With regard to the remark in the written statement that those who failed to compete in the examination should be given preference in appointments to district boards, municipalities, and guaranteed railways, the witness said his proposal was that if there were five vacancies in the Public Works Department ten men should be nominated and top five of them selected by a competitive examination for the Public Works Department; the other five would be taken by district boards, etc. Local Governments would no doubt be glad to give preference to men who had had a very high engineering training. He did not think the method would interfere with the powers of local self-government.

71,894. (*Mr. Abdur Rahim.*) Of late, designs for bridges had been obtained from England in one or two instances. For the Sara Bridge, he understood both designs and materials came from England. The principal work of his department was in connection with roads, buildings, bungalows, etc., but certain irrigation and drainage schemes had to be drawn out. Two new canals had been built in Bengal during the last few years, and he had been employed upon their construction with other Indian-trained Engineers.

71,895. The service would not be satisfied unless it had the same pay, pension, leave, and conditions for men doing the same class of work.

71,896. (*Sir Murray Hammick.*) The witness said his knowledge with regard to the designers of bridges was rather limited, as he only knew of two instances. The general supervision of the work and the preparation of the designs were in the hands of Engineers in India.

71,897. He did not believe in the value of European training for Engineers for Indian work. The training at Sibpur was quite sufficient with one or two slight modifications. Although he objected to the present arrangement under which subordinates were trained with men who received Provincial appointments, under the system he proposed for the first three years the subordinates would all be trained with the men intended for the superior Engineer Service, but it would be found there was really a difference of training at the end.

71,898. (*Mr. Green.*) The foreign allowance should be given so as to make the pay for the European in India above what would be received in England, but not above the standard in India. His information was that Europeans would obtain less pay if they remained in England.

71,899. (*Shashi Bhusan Mazumdar.*) He knew of a large number of Bengalis who had taken to engineering as a profession and were managing their own businesses as engineers. Indian engineers after retirement from the service often engaged in active practice, and he had never accepted the statement that the Bengali had not an aptitude for the engineering profession.

(The witness withdrew.)

At Calcutta, Tuesday 6th January, 1914.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

THE EARL OF RONALDSHAY, M.P.
SIR MURRAY HAMMICK, K.C.S.I., C.I.E.
SIR THEODORE MORISON, K.C.I.E.
SIR VALENTINE CHIROL.
MAHADEV BHASKAR CHAUBAL, ESQ., C.S.I.
ABDUR RAHIM, ESQ.
WALTER CULLEY MADGE, ESQ., C.I.E.
FRANK GEORGE SLY, ESQ., C.S.I.

HERBERT ALBERT LAURENS FISHER, ESQ.

And the following Assistant Commissioners:—

H. H. GREEN, ESQ., Superintending Engineer, Bengal.
SHASHI BHUSHAN MAZUMDAR, ESQ., Executive Engineer, Bengal.
W. McM. SWEET, ESQ., Chief Engineer, Assam.
H. WATKINS, ESQ., Assistant Engineer, Assam.

R. R. SCOTT, ESQ. (*Joint Secretary*).

RAI BAHADUR ANNADA PRASAD SARKAR, Superintending Engineer, Bengal (retired).

Written Statement relating to the Public Works Department.

71,900. **(I.) Methods of Recruitment.**—*Imperial Engineers recruited in England.*—The present system of selection by a Committee should be substituted by a competitive examination in England. In my opinion all Engineer Officers from Assistant Enginer and upwards, whether European or Indian, should be Imperial Engineers, and their recruitemnt should be both from England and from the Indian Colleges, as was the case before the introduction of the Provincial Service in 1882. The present Provincial Service

should be remodelled and placed on a footing similar to that of the Provincial Civil and Judicial Services, for reasons enumerated under the item III (conditions of service).

71,901. **(II.) System of Training and Probation.**—*For Engineers.*—The system of training that now obtains in Bengal seems to be defective and disadvantageous both to Government and the candidates, and the tests and examinations appear to be unnecessarily rigorous. In the Sibpur Engineering College the minimum educational qualifications for admission as a regular student are that a candidate shall have passed (*a*) Intermediate Examination in Science or Arts of the Calcutta University in English, Mathematics, Physics or Chemistry, and (*b*) pass such special test in drawing as may be prescribed from time to time by the Principal; such a candidate must be under 21 years of age. Under the present University Regulations the minimum age of a student at the time of his admission into the College will be about 19 years. He enters the College in the month of July. The College course is for four years, with an intermediate University examination at the end of the second year.

The final B. E. Examination is usually held in July. Then the passed students commence a year's practical training under some Public Works Department Engineers some time in the following October. Then after completion of the year's training another examination is held at Purulia in the month of November, and the successful candidate is appointed as Apprentice Engineer in the Provincial Service some time in January or February. Thus it will be seen that even a very meritorious student, who successfully passes every examination at the first chance, will take nearly six years from the date of entering the College to get an appointment in Public Works Department, Bengal, as an Apprentice Engineer on Rs. 100. After the probationary period of one year as Apprentice Engineer, he is promoted to the Assistant Engineer's grade on Rs. 250 if he succeeds in obtaining a favourable report from his Executive Engineer. The result is that an Indian Engineer commencing service at the age of 25 or 26 on the lowest pay of Rs. 100 becomes superannuated before his time comes for the higher administrative posts.

It is also disadvantageous to Government, as they get on an average of about 28 years' service from its Indian College Engineers, against about 32 from Europeans. Besides, the Government takes Indian-trained men into its service, when a considerable portion of their energies was used up in passing a number of stiff and unnecessarily rigorous tests and examinations. It is, therefore, very necessary that the system of recruitment should be thoroughly changed and simplified. It would not be out of place here to mention that the rules framed for the proposed Dacca Engineering College in connection with the Dacca University Scheme will make matters much worse. The minimum educational qualifications for admission is that the student must pass the I. Sc. Examination. Then the College course is for four years, and then practical training for three years. So a student will be about 27 before he can expect Government appointment.

I would therefore propose that age limit for admission may be fixed at 19. The minimum educational qualifications required for admission will be the passing of the Matriculation in the First Division. With better prospects for the passed students of the Engineering College there will be a very large number of applications from very meritorious students for admission into the College, and the Principal will be able to pick up the best students from the top of the list prepared according to their marks in mathematics and half the number they obtained in English. Of course, each student should produce a health certificate from the College Surgeon and a certificate of good character from the Head Master of his school.

The College course may advantageously be fixed for four years, during which the student should be given both theoretical and practical training in all the branches. The University examination that will be held at the end of the fourth year should also be both theoretical and practical. On the results of this examination the appointments on probation to Public Works Department should be made without any further practical training or practical examination. I may also note that facilities should be afforded to the students while in the College to learn riding and cycling, and certificate from the Principal to the effect that the student can ride and cycle will be required before he is allowed to appear at the final examination at the end of the fourth year. The probationary year of the Indian College engineers may advantageously be passed in England, where they can see large and important engineering works. By the proposed system, I am sure that the Government will find in these new recruits highly trained men, both in theory and practice, full of youthful vigour and energy which, with a few years' experience and mature judgment, will make them very valuable and useful officers. These officers will be able to render useful service for a much longer period than at present.

For Deputy Engineers who should belong to the proposed Provincial Service referred to under item III (conditions of service). These officers should be appointed after undergoing a year's approved practical training in India, Public Works Department, after graduating. An allowance of Rs. 100 per month will be given to them during the probationary period, they being confirmed in the 6th grade at the end of this term. No difference in the scale of allowances should be made as at present between Europeans and Indians, as this distinction in the beginning of a young man's career has a very deleterious influence, creating a feeling of diffidence and inferiority. A further care is necessary to secure that they are not huddled up with the non-qualified Overseer-passed students as at present. No further departmental test should be made for selection for the same reasons as given for Engineers.

71,902. **(III.) Conditions of Service.**—The present conditions of service do not appear to be satisfactory. The officers recruited from England, whether Europeans or Indians, are called Imperial, and those appointed from the Indian Colleges are known as Provincial Engineers, with about two-thirds of the salary of the former. This distinction in their status and difference of salary, while they are called on to perform the same onerous duties and hold the same responsible positions, have caused many difficulties in the way of Provincial Engineers. In the Indian Civil Service there are a few listed posts thrown open to Indian officers of the Provincial, Civil and Judicial services. These officers are required to perform the same duties and hold the same responsible positions as the civilians, although their salary is about two-thirds of that of the civilians. But the conditions in this service are quite different from those of the Engineers. The salary of the Indian Civil Service is much larger than that of other services, and two-thirds of that represent a fairly good salary for the officers taken from the Provincial services. Besides, senior officers of the Provincial, Civil and Judicial services are generally appointed to grades of Magistrates and District Judges, and their pay (about Rs. 1,000 and upwards) then becomes much more than, or sometimes double of, their salary on the Provincial Service, and they consider it a great privilege and a good promotion to be so appointed to the listed posts. But in the Public Works Department our Imperial Executive Engineer has to begin with a salary of Rs. 700 only, and two-thirds of that comes to about Rs. 475, which is hardly sufficient in these days for enabling a Provincial officer to maintain his position as an Executive Engineer of a Division—a position corresponding to that of the District Magistrate in the Indian Civil Service.

The cost of living and education of children has increased considerably during the recent years. Owing to this as well as to the occasional heavy expenses on marriages and other ceremonies, which are quite unavoidable for an Indian officer of his standing and position, a Provincial Engineer finds it difficult at times to make the both ends meet. Besides, his small salary renders it rather difficult for him to exercise the required amount of control over, and command respect and obedience from, his subdivisional officers, amongst whom there may be a senior Sub-Engineer drawing nearly the same pay, or an Assistant Engineer of the Imperial Service drawing more salary than he gets. At the present time Mr. Vieyra, Assistant Engineer, Provincial Service, drawing Rs. 375 per month, has

been placed in charge of the 1st Calcutta Division in which there are two Senior Subordinates as subdivisional officers, one of whom, Rai Sahib Priya Krisna Biswas, draws Rs. 450, and the other, Mr. Traise, draws Rs. 400 per mensem, excluding the subdivisional allowances. I am afraid it will be extremely difficult for Mr. Vieyra to exercise the required amount of authority over, and command respect and obedience from, those subdivisional officers.

A very large amount of public funds is annually expended through the subdivisional officers, and it is to the best interests of Government to strengthen the position of its controlling officers (Provincial Engineers) by improving their status as well as by increasing their salary with a view to keep them above want. I may also note that the Provincial Engineer Service is not so popular. As far as my information goes, three senior Anglo-Indian Subordinates were offered promotion to the Provincial Service, but they thought it more advantageous to them to decline the offer, and preferred to remain as subordinates. It would not be out of place here to mention that contentment amongst the members is very essential for the efficiency of the service, but from the repeated representations from the members of the Provincial Service, I am afraid, they are not much satisfied with their present position.

From the above it is, I believe, clear that in the interests of both the members of the Provincial Service and the Government, the abolition of the existing Provincial Service is very necessary, and all officers of the Engineer establishment should have equal emoluments and privileges, excepting leave allowances, which, in my opinion, should be on a more liberal scale in case of Europeans. In the above prayer I am not asking for any unusual concessions or privileges, but proposed change would simply have the effect of restoring the service to the conditions that obtained more than 20 years ago. For nearly 30 years previous to 1892 the Indian and European Engineers, recruited from England or India, enjoyed equal privileges and worked side by side in close union and harmony, and their united hands guided from inception to fruition works of great magnitude and importance in the Public Works Department, and it is very desirable that the same old conditions should now prevail. Our benign Government have introduced in recent years Provincial services in the Civil, Judicial and other departments to improve the status and condition of the subordinate establishments entrusted with subordinate duties in their respective departments. The position of a Deputy Magistrate or a Munsif, who was considered a subordinate, some years ago, has been much improved by the creation of the Provincial Service in the Civil and Judicial Departments, though their duties remain the same as before. But the creation of the Provincial Service in the Public Works Department, instead of improving the status of its subordinates, which is very badly needed, had unfortunately the effect of lowering that of its officers.

Deputy Engineers.—As already said above, the creation of the Provincial services in the Civil and Judicial departments has greatly improved the status and position of the Deputy Magistrates and Munsifs usually entrusted with subordinate duties in those departments. It is now time that something should be done for improving the position and emoluments of the Upper Subordinates of this department. In the olden days candidates with indifferent knowledge in Engineering were appointed as Upper Subordinates, but the conditions are quite changed. Now graduates in Engineering are usually employed as Upper Subordinates. The course of study and training undergone by them is far more difficult, and extends over a longer period than that of a candidate for the Provincial Civil Service. They are now usually entrusted with much more important duties than formerly, and their case deserves favourable consideration. It is believed that the question of improving their position is now engaging the attention of Government. The creation of the Provincial service for these Upper Subordinates appears to me to be the best solution of the problem. The members of this Provincial service may conveniently be called Deputy Engineers. These subordinate officers, generally in charge of subdivisions, directly deal with the expenditure of a large sum of money annually, and the temptations are great. I think it will be to the advantage of Government to improve their status and increase their salary to a slight extent.

71,903. **(IV.) Conditions of Salary.**—*For Engineer Officers.*—The existing scale of salary apears to be sufficient.

For Deputy Engineer of the proposed Provincial service, I would propose six grades ranging from Rs. 150 to Rs. 500, as noted below :—

	Rs.
1st grade	500
2nd ,, ...	400
3rd ,, ...	300
4th ,, ...	250
5th ,, ...	200
6th ,, ...	150

Nowadays Engineer graduates are appointed in the 1st grade Overseer on Rs. 100. They can rise to Sub-Engineer, 1st grade, the maximum pay of which, including two increments, of Rs. 50, is Rs. 500.

From the above it will be seen that the maximum pay (Rs. 500) of the proposed Deputy Engineer is the same as at present. Only the initial pay is recommended to be Rs. 150, in the place of Rs. 100, in the existing scale. Thus the creation of the Provincial service of Deputy Engineers will not involve a very heavy additional expenditure.

71,904. **(V.) Condition of Leave.**—For short leave and leave on urgent private affairs the rules, which are the same in case of Europeans, are fair, but the latter leave may be granted to Indians in instalments. As regards furlough, the proposal now under consideration of the Government will suit.

71,905. **(VI.) Conditions of Pension.**—The maximum limit of ordinary pension should be raised from Rs. 5,000 to Rs. 6,000 per annum.

Special pension for the service of three years as Superintending Engineer should be Rs. 1,500 in place of Rs. 1,000 as at present.

Special pension for service of three years as Chief Engineer should be Rs. 3,000 in place of Rs. 2,000 as at present.

71,906. **(VII.) Limitation in the Employment of Indians.**—The maximum limit of 10 per cent. of appointments by the Secretary of State should be raised. The low limit was put, as it was anticipated that the Department will be swamped by Indians otherwise. Experience shows now that these apprehensions are groundless. Besides a fairly good number of officers appointed from Indian Colleges, as shown in the Classified List, are Anglo-Indians. I believe the maintenance of a large European element in a technical department like the Public Works Department is not demanded for political consideration, and therefore strongly urge that a larger number of appointments may be thrown open to Indians in this Department than hitherto.

If the above proposal be adopted and the prospects of Engineer Service be improved, the best intellect of the country will be attracted to our Engineering Colleges, and, if at the same time the system of training in our colleges be improved and placed on a sound basis, the out-turn cannot but be highly satisfactory. In my opinion expension of Engineering education amongst the people of this country is very necessary for the development of its resources, for advancement of its sanitation, and for improvement of its drainage and water-supply.

71,907. **(VIII.) Relation with the Civil Service.**—The relations with civil officers are cordial.

RAI BAHADUR ANNADA PRASAD SARKAR called and examined.

71,908. (*Chairman.*) The witness had been 28 years and 7 months in the service. Prior to his retirement he had officiated as Chief Engineer in Bengal for four months.

71,909. The maintenance of a large European element in the Public Works Department was not demanded by any political considerations, and therefore he urged that a larger number of appointments

should be thrown open to Indians. He suggested the proportion of those recruited in India and those recruited in England should be half and half, which would mean nearly doubling the present proportion of Indian Engineers.

71,910. He advocated a competitive examination in substitution for the present system of selection, because it was not possible to test the qualifications and capacity of a candidate simply by an interview. He admitted that the selection was based upon a qualification, and was not merely haphazard, but a University degree was not compulsory in all cases. He did not know of any cases of candidates who had been admitted to the service who had not a qualifying degree prior to selection, so that his objection to the present system of selection based upon a qualifying test was a theoretical one. He would insist that competitors should hold some University degree, which would mean that they would have to have some practical as well as theoretical training in the University. He would not say that the officers now entering the service were not properly qualified for their duties, as he had no personal experience of the matter.

71,911. He was not in favour of the suggestion that all Indian candidates for the Provincial Service should be trained at one central college; there was ample room for the present four colleges. In Bengal there were special engineering conditions, such as tidal navigation, channels, waterways, the improvement of drainage, and the reclamation of waste land, all of which were peculiar to Bengal and the theory of which should be studied in a Bengal college. The average number of candidates passed out of Sibpur College every year was seven or eight, only one of whom was admitted to the superior service. In spite of that fact, he could not say it would tend to more efficient education and training if one central college were established, more efficient training would be secured by increasing the number of appointments from the several Provincial colleges.

71,912. He suggested a new service of Deputy Engineers in substitution for the present grades of Sub-Engineers, Supervisors and Overseers. With regard to the training of those officers, at present they were usually graduates of the Sibpur Engineering College, and he would not make any alteration in that. The guaranteed posts would be filled by the best men, and the rest of the men would become Deputy Engineers.

71,913. The statement, that the facilities available in India for practical training were as good as those in England, might be true, but in England men could see all kinds of works and gain considerable benefit by their travelling. English training was no better than Indian training, except in the matter of this additional experience.

71,914. (*Lord Ronaldshay.*) The system of recruitment in witness's day was by competition. There were two guaranteed posts in the superior service open to candidates from Sibpur in the year he was selected. He was trained alongside all the other students who were eventually to become subordinate officers. In one way that was a good system, in that the present sub-divisional officers were of a very high stamp, and were rendering very useful assistance in the department.

71,915. His object in suggesting the creation of a class of Deputy Engineers was to improve the status of the subordinate service. If that were done, it would be possible to fill all the sub-divisions from the Deputy Engineer class instead of employing temporary engineers, and it would be possible then to confine the temporary Engineer to temporary work, and not put him in permanent charge of sub-divisions.

71,916. (*Mr. Sly.*) The reason why certain subordinates had at one time declined to accept promotion into the Provincial Service was because they were obtaining practically the same pay, or more, in their then positions, and if they had entered the Provincial Service, they would have had to begin at Rs. 250, and to take their chance of promotion according to the term of their service. Probably by remaining in their subordinate position their prospects of promotion were much higher. Time would not have permitted of their being promoted to a much higher salary, if they had entered the Provincial Service.

71,917. There was a fairly good demand for Engineers outside Government service, for instance, in private firms, on District Boards, etc.

71,918. (*Mr. Fisher.*) The salary a man would receive on District Boards immediately after leaving college would be about Rs. 150.

Practical and theoretical teaching should go hand in hand in all the colleges, but under the present system the practical work had to be done after the college course. Some students were taken to important works occasionally, but not to any large extent.

71,919. (*Mr. Madge.*) In India the conditions of engineering work were so different in the different provinces that it was necessary that students should be conversant with the work they would have to perform during their service later on, and in that connection provincial institutions seemed to offer more advantages than a central college. The training obtainable in India was in some cases up to the standard of the training obtainable in England, and in some respects the Sibpur College course was much stiffer than the old Coopers Hill course. He did not approve of the removal of Sibpur to Dacca, as there were hardly any engineering works of importance in the neighbourhood of Dacca and the training of the students would be purely theoretical; it would be analogous to teaching chemistry without a laboratory. If the Sibpur College had to be removed on the ground of the district being unhealthy, he would prefer a large Provincial college in the neighbourhood of Calcutta.

71,920. (*Mr. Abdur Rahim.*) The work done by the Engineering Department chiefly related to buildings, canals, waterways and embankments, the buildings including hospitals, schools, colleges, godowns, etc. Of late very few canals had been built, the work now being mostly drainage channels, drainage being the principal work at present in Bengal. Executive Engineers were placed in direct charge of all works, both construction and maintenance.

71,921. The practical training of students in irrigation was not satisfactory at Sibpur; there should be more practical training on the works themselves. Practical training should accompany the theoretical training as at Cooper's Hill. He recommended a four years' course. Students at Sibpur should be taken to different works for practical instruction, and at the end of the course they might at once enter the service. Sibpur College covered Bengal, Bihar, and Orissa, Assam and Burma, but Bihar and Orissa were not now taking officers from the college. At present he believed that in Bengal only one Rurki student was employed.

71,922. (*Sir Murray Hammick.*) Some students after leaving the college underwent practical training at their own expense, and frequently applied to complete their training on Government works. Many went to railways with scholarships given by the Educational Department, and therefore paid nothing. Those who were not fortunate enough to obtain the Government scholarship had practical training on Government engineering works in Calcutta and the district. One of the conditions of employment by a District Board was that a man should have had some practical experience in the Public Works Department or other recognized institution for five years. Of the students who could not obtain practical training, some entered works in different capacities, others started private work on their own account, and some joined the staff of contractors. A student leaving college generally considered that, having passed his examination, he was entitled to be paid for any work he might do. As a rule students were capable of doing certain forms of work under a sub-divisional officer and usually carried out their duties satisfactorily.

71,923. (*Mr. Green.*) After Coopers Hill men had completed their third year and passed a final examination they were taken into the service and in their first year were either sent out to India for practical training or given that training in England. A further year's probation in connection with particular kinds of work would be useful.

71,924. With regard to the pension paid to Chief Engineers appointed before 1898, it did not consist of Rs. 2,000 in addition to Rs. 1,000, the pension of a Superintending Engineer, but of Rs. 2,000 in all.

71,925. (*Mr. Mazumdar.*) The scale of salary he had proposed for the Deputy Engineers would be a vast improvement on the present rate of salary, and Deputy Engineers would be glad to have some improvement, however small. Later on probably it would be necessary to improve the salary again.

(The witness withdrew.)

SIR RAJENDRA NATH MOOKERJEE, K.C.I.E. (of Messrs. Martin & Co., Calcutta).

Written Statement relating to the Public Works Department.

71,926. **(I.) Methods of Recruitment.**—For the superior grades of Engineers for the Imperial Service I would suggest that two-thirds be recruited from England and one-third from India by open competition, the examinations in both countries to be of the same standard. It would be desirable to have the examinations identical and held simultaneously, but if this is considered inexpedient the subjects and question forming the examinations should be practically the same.

71,927. **(II.) System of Training and Probation.**—The successful candidates recruited in England (*i.e.*, two-thirds of the total number required each year) should have one year's practical training and probation service in Europe before coming to India. They should during this probationary period pass a colloquial examination of the language of the province to which they are posted. On the termination of one year, they should pass a further examination testifying the practical experience gained and then be sent to this country. Those recruited in India (*i.e.*, about one-third) should be sent to England to get practical experience *for two years*. Candidates from both countries should receive the same allowance during the probationary period, but no one ought to be confirmed in the service who has not passed the practical test examination.

71,928. **(III.) Conditions of Service.** — Should remain as now in force in the Imperial Service, *i.e.*, as for the Indian Civil Service.

71,929. **(IV.) Conditions of Salary.**—European and Indian members of the Service should receive the same salaries, whether recruited in India or England provided they qualify themselves according to what has been stated above in paragraphs 71,926-7.

71,930. **(V.) Conditions of Leave.**—Should be the same as in the Indian Civil Service.

71,931. **(VI.) Conditions of Pension.** — There should be no distinction, but should be as now exists in the Imperial Service, *i.e.*, European and Indian members alike draw the same pension.

71,932. **General Remarks.**—The number of appointments to be offered to Indians in India should vary according to the number of Indians passed and admitted in England, so that the number of Indians in the Service should not exceed one-half of the total number at least not during the next few years. There should be a separate service called the Provincial Service, the members of which may be styled "Deputy Engineers" or "Assistant Engineers" or some such name. They should be recruited from the Provincial Engineering Colleges by competitive examination. The successful candidates for this service should receive practical training in *India* for two years and during this probationary period receive a salary of Rs. 100 per mensem. On the termination of the two years a further examination on practical experience should be held and those who pass may be confirmed in the service on a salary of Rs. 200 rising to Rs. 600 per mensem with travelling allowance, &c., as at present. As a rule the members of the Provincial Service shall not be appointed to Executive or Administrative appointments. Exception may be made in specially meritorious cases where such promotion may be permitted, but before the promotion is given, the "Deputy" or "Assistant Engineer" should be compelled to spend one year in Europe to obtain practical experience there. They should be allowed study leave or furlough for that period.

There should also be a Subordinate Grade to be recruited by open examination from the Provincial Engineering Colleges. These men should receive practical training for one year during which probationary period they should receive a salary of Rs. 40 per month. When they pass they will be confirmed in the service on Rs. 60 rising to Rs. 150 per mensem. Specially meritorious members may be promoted from the Subordinate Grade to the Provincial Service.

All candidates whether recruited in England or India should be required to produce certificates of character and social status from two people of standing (to the satisfaction of Government) in addition to medical certificate.

My remarks above have been confined to recruiting.

To remove the grievance of those who now hold Executive Engineer's posts I suggest that they be allowed to proceed to England to such study of scientific subjects as will be prescribed by Government, and on their qualifying they be permitted to enter the Imperial Service in the same grade as that in which they were posted before going to England. During their absence from India they will get study leave allowance.

SIR RAJENDRA NATH MOOKERJEE called and examined.

71,933. (*Chairman.*) The witness said his recommendation was that two-thirds of the superior service should be recruited from England and one-third from India by open competition, and he would regulate the recruitment so that not more than 50 per cent. of the vacancies in the service should be filled by Indians. After the English appointments had been settled an endeavour should be made to discover how many vacancies still existed, and so many appointments should be made in India for that year. For instance, supposing the Government required 50 Engineers for a certain year, and 30 or 40 were appointed by competitive examination in England, out of which number 10 or 20 were Indians, competition should be held in India to fill the number of vacancies to which Indians were entitled. The present selection did not give satisfaction or tend to the efficiency of the service, as a certain amount of favouritism could not be avoided. He knew from his experience that the 10 per cent. Indians selected by the Secretary of State were not so good as some of the Indians who were not selected.

71,934. The number of Engineers employed by Messrs. Martin & Co. amounted to about 100, 10 of whom were Europeans, and 90 Indians. The best men obtainable were recruited by selection on a qualifying test, and he regarded that as the best method of obtaining the most efficient men. There was no fixed proportion between Europeans and Indians, an Englishman being brought out when a man of high attainments or qualifications was required for certain work. There was only one Indian in the higher posts of the firm, the responsible charges being held by Europeans. At present there were only two Indians on the staff who had been trained in England. The Indians were recruited from different colleges in India, many of them coming from Sibpur and Rurki, and one or two from Poona. He did not attach much importance to the particular college, having had three or four very good men from Sibpur and one or two from Rurki. The training in colleges was only theoretical and it depended on the man himself after he left college whether he became a good Engineer. The age of recruitment was twenty-one to twenty-five except in the case of Europeans, who often came out between twenty-five and thirty. Young Indians were only taken on as apprentices and given a small allowance for a year or two before being placed as Engineers in any responsible work. A European Engineer had always had experience, either on rail-

ways or waterworks or in architectural work, but the firm themselves preferred to give Indians their practical training, paying a lower salary while doing so.

71,935. Witness favoured the establishment of one well-equipped college for training for the higher posts in the service, each province sending its own men to the college. He advocated a central college purely on the ground of efficiency in training.

71,936. In future Indians recruited to the Imperial Service should be sent for two years' practical experience to England, where they would not only obtain technical engineering experience, but would have their views very much broadened, their general culture improved, and would learn lessons of manliness, courage, etc. On their return they should be posted to work where they would be under supervision, and, if they passed a practical test, should be made officers in the service. Some Assistant Engineers might be recruited in India without going to England. He laid great emphasis on English training, because his experience showed that Engineers who had been to England were much better men than those with only Indian experience; they attained to positions of greater authority and responsibility in the business.

71,937. He regarded it as injurious to the service to lay down the proposition that so many promotions to the superior service should be made every year, and considered it should be left to the discretion of the Government as efficient men were found.

71,938. European and Indian members of the service should receive the same rates of pay whether recruited in India or in England. There was some difference in the market value of imported labour as compared with local labour, but considering the question from the broad point of view it was better that men should have the same pay; discrimination only tended to increase discontent and raise the racial question. Young Europeans coming into India on higher pay for the same work came to the conclusion that they were better than the Indian men. Indians were adopting English modes of living and had as much expense as Englishmen, because they could not discard their own relations and friends. He thought an Indian would be prepared to serve in England for the same salary as he received in India, but in some parts of the world there might be circumstances which necessitated higher pay. If a scheme were devised which generally recognised that imported labour was paid at a higher rate than indigenous labour, he would still insist on no difference being made. Very few Indians would aspire to the higher positions, as the general capacity of European Engineers was greater than that of Indians, and promotion according to merit would lead to very few Indians attaining the administrative grades. A few hundred rupees more paid to Indians would not be a very heavy burden on the Exchequer.

71,939. (*Sir Murray Hammick.*) When he said that the best men in England did not get appointments, he was referring to Indians, not to Europeans. If Indians were asked to go to England for two years before the higher posts were available to them, not a very large number would go, and men, who had aspired to the higher posts and became as competent as Europeans, should undoubtedly receive the same pay. It was an injustice to pay an Indian less than a European, if he reached the same standard and performed the same work. When Englishmen would not come to India on the same pay as the Indian then would be the time to consider the question of a higher allowance. The best Indians would not be obtained if they were told that they would have to do the same work as the Englishmen on two-thirds of the pay. It was for that reason that the Engineering Department at present was so badly manned.

71,940. (*Sir Valentine Chirol.*) He was aware that a man who obtained a certain pay in England was often given a foreign allowance when serving in other parts of the Empire, but that did not apply to India. He did not think it was good policy, having regard to the present condition of the country, to give the same rates of pay to Indians and Europeans and supplement the pay of the latter by an Indian service allowance.

71,941. There should be no Public Works Department in the Presidency towns except a supervising establishment to direct work done by private agencies, and the Commission might take into consideration the question whether it was necessary now to recruit on the same scale as in the past. He recommended that the recruitment should be very much less. Work now done by the Public Works Department could be carried out more efficiently and at less cost by private enterprise. As an instance, he mentioned that his firm had been given building work at Dacca, and had completed the work before the time stipulated, and the work had not been inferior to the work done by the department. Very little work was given to his firm, owing to the department desiring to do everything themselves, but wherever opportunities had been given the firm had proved that they were able to do the work better and cheaper than the department itself. Having to maintain a very large establishment the estimates of the Public Works Department were often higher than necessary, but no such large establishment was needed. Whenever the firm had works to carry out which required a larger staff than the normal establishment, temporary assistants were engaged locally, and if exceptional experience was required men were brought out from England.

71,942. The Irrigation Branch of the Public Works Department stood on a somewhat different footing from the other branches, because they had certain administrative functions to perform, such as assessing rents, rates, etc., and he gathered that the Irrigation Service suffered somewhat owing to its being a part of a department in which a great deal of other work was carried on.

71,943. His firm did not always take men with University titles and degrees but men with practical experience who had been apprentices to large firms. In the Public Works Department, however, which was a Public Service, the Government had to pay something towards the training of their Engineers. In engaging their men the firm did not care whether men had University degrees or whether they were over 30; they chose the best men, paid their passage both ways, and gave them good pay. The Government, with their rigid rules, could not do that, and, therefore, it was best to have a competitive examination and train the men afterwards. He was not a believer in academic distinctions for professional work.

71,944. (*Mr. Abdur Rahim.*) The Europeans in his firm were recruited at a higher age than those who entered the Public Works Department, and they were given special rates of pay and a certain share in the profits. The pay varied from Rs. 800 to Rs. 2,000. They corresponded to Superintending Engineers in the Public Works. They came out on a five years' agreement, which was generally renewed, and there were men at present who had been 25 years in the firm's service. A pension fund had been established to which the men subscribed, the firm adding an amount equal to the subscriptions. The leave rules were not very rigid. Sometimes if men had worked very hard they were given six months' leave on full pay after three years' service, and their passage out and home was paid by the firm. According to the agreement they were entitled to three months' leave on full pay after three years' service, but they were generally given more.

71,945. Indian Engineers came from the Indian colleges as apprentices on Rs. 100, and if they did good work could rise to Rs. 800, promotion being made not on an incremental scale but according to competence. There were two Anglo-Indians in the service who received the same pay as Indians. The Indian in the highest grade was paid the same rate as the European and was treated as an Englishman in every sense, and every Indian doing the same work as a European would receive the same pay. On all grounds, political and social, he deprecated any distinction in pay and promotion being given by length of service. His own scheme was that Indians on Rs. 200 to Rs. 600 should be employed on most of the work; and that there should be a limited number of European and Indian Engineers on higher pay doing the higher class of work.

71,946. (*Mr. Madge.*) He practically proposed simultaneous examinations for recruitment. The standard of engineering in India was at present not as high as in England, and if a simultaneous examination was adopted, the Indian college course would

have to be altered to agree with the course in England. Indian theoretical training should be levelled up to the British standard. Until that was done it would be necessary to recruit in England for some time. Should the Commission come to the conclusion that the difficulties in the way of simultaneous examinations were so great as to make them impossible, he would be satisfied to have the standard of examination in India made the same as that in England.

71,947. One well-equipped college for the whole of India would be quite sufficient for a number of years to come to train all the engineering students in the country. He would not, however, abolish the Provincial colleges, as there might be technical colleges for the training of men for the posts the pay of which was Rs. 200 to Rs. 800.

71,948. With reference to the appointment of Engineers to his own firm, in the case of Europeans testimonials were sometimes obtained from well-known Engineers with whom the candidates had been working or from managers or railway companies or large engineering firms. In the case of Indians the firms generally noted whether they had any college certificate, though personally he did not attach much value to that. There were many men in the firm who had failed in the examination of the engineering colleges and yet were better men than those who had passed. If a boy who had failed entered the firm he was taken on as an apprentice and in a few years very likely became a useful man. It was practically a system of selection, not a competitive examination. His objection to selection in England was based on the fact that the Public Works Department was a public service and without public competition there would be complaints. The public had no knowledge of what went on in connection with Messrs. Martin & Co. and therefore could not interfere, and there was no newspaper comment upon the appointments. Personally he thought selection would be the best, but he believed the public would not agree with him.

71,949. There were not many domiciled Europeans or Anglo-Indians in the firm, but those who were there were as good as Indians. Unless they had been to England, however, they were not as good as Englishmen.

71,950. He objected to promotion from the Provincial Service to executive and administrative appointments, but admitted that some very good officers had been obtained in that way. On the whole he thought such selections were not wise and believed if Chief Engineers were asked privately they would say the same thing.

71,951. (*Mr. Fisher.*) In each of the Presidency towns there was a sufficient number of efficient and trustworthy firms to undertake work now done by the Public Works Department, and if the department were abolished there would be a very healthy competition not only in Calcutta, Madras and Bombay, but in Allahabad and Lucknow. That would naturally involve the corollary that the Indian Stores Department in England would come to an end or be considerably reduced. The Government could supply itself with what it needed quite well in India. If the Commission would take evidence from all the Engineers in responsible position, confidentially, allowing them to say freely what they thought, they would unanimously say that the Stores Department should be abolished.

71,952. He laid very great stress upon training in England and his views were not modified by the difficulties that might exist in England as to means of training in connection with civil engineering. The men could obtain a good training on railways and on other extensive works, and they would at the same time be acquiring a general culture which was of great importance to them; he laid much stress on the social value of an English training. The fact that it was almost impossible to give men civil engineering work in England did not really effect his conclusion, as it was necessary for civil engineers to obtain some knowledge of mechanical engineering as well, and it was on the mechanical side that Indians were weakest.

71,953. There was a large field of training for civil engineering work in India if arrangements could be made with private firms. Such arrangements could be made if the money were forthcoming, but students objected to serve as apprentices without pay. It was true that, owing to the fact that a good deal of manual work was done by lower caste Indians, Indians of good family would not work side by side with them, but that prejudice was gradually dying out. There were not the same facilities for training in mechanical engineering and electrical engineering in India as existed in England. Indians entering the Public Works Department should be of very good family as they were exposed to great temptations in that department; to some extent his objection to the selection of Indians in England was founded on the fact that this consideration had not been kept in view.

71,954. (*Mr. Sly.*) It was not true that Government works in Presidency towns were already given out on contract; the contract only referred to labour. The department did everything, even to the making of bricks. The labour was contracted for and put under the supervision of Overseers and Sub-Engineers. It was impossible, having regard to the way the work was done, for any self-respecting man to take work under the Public Works Department. The accounts of the department were "cooked" in different ways to show that cheaper work could be done than by private firms. He did not know of any work that had been given out to a contractor by the department. Outside Presidency towns the department at present would have to continue, but if his scheme were adopted, all Engineers would stop hankering after Government service, and in a few years the Public Works Department would only need generally to supervise the scheme to see that the work was being done satisfactorily.

71,955. In his proposal for the creation of a separate college for the whole of India he had considered the difficulties that might be experienced in inducing people from different parts of India to go to one college, but he had come to the conclusion that students who would not go to another part of India were not fit to be Engineers. Rurki would make a very good centre for the College, and it would be quite reasonable to ask Madrasis to be trained at Rurki, as a man who desired to be an Engineer should be prepared to work anywhere at any time. If the number of students were sufficient, the Government could select men to work in their own provinces, but he saw no objection whatever to a Madrasi going to Bengal or a Bengali going to Madras. All Engineers should be Imperial Engineers on definite salaries, and appointments should be made either by the Government of India or the Secretary of State. In distributing the men Government would consider whether they were Muhammadans, Bengalis, or Madrasis, and he did not think the current idea that the Bengali would monopolise everything was correct; Madrasis and others would soon be taking their rightful place.

71,956. When men had passed through the central college they should be sent to England for two years' training. They might put in one or two years' service in India before being sent, but he thought they would benefit most if they went when they were quite young, directly they had left college.

71,957. (*Mr. Chaubal.*) The witness believed there were sufficient facilities in England for Indians to obtain practical training in everything except civil engineering. As a rule, it would only mean that ten Indians would require training in England each year, and he thought that number could be provided for quite easily.

71,958. The Indians who were employed by his own firm in the higher ranks did not rise from the lower ranks but had five years' training in England and were recruited like Europeans. Among the 90 Indians there were none who in the course of time would be capable of doing the same work which the superior Engineers now did. If trained in England it would not be impossible, but to be placed in a position similar to that occupied by Europeans in the firm Indians required to be equal in every respect, both professionally and socially.

71,959. His reason for confining the work of private companies to Presidency towns was that in Calcutta large firms would not go to the mufassal unless the work was worth while. If it became the practice to

entrust mufassal work to private companies more private companies would take up the work, and gradually Engineers from engineering colleges would divert their attention to private practice. There was nothing in the nature of engineering work in the mufassal which made it essential that it should be performed by a Public Works Department. As a matter of fact the work was generally of small extent and required very little engineering skill.

71,960. If a central college were established, before students were admitted they should be tested in drawing, mathematics, etc., and naturally those who came from a Provincial college would have had greater facilities for studying such subjects. A man with a good aptitude for mathematics might enter the college after a year at a Provincial college while other men might take three years. The central college course would occupy three years. He would not make it compulsory for a student to have previously been in a Provincial college; if a student had taken his B.A. from any good college he might quite well enter the central college. It would be quite possible for a man to pass out of the central college at the age of twenty-five.

71,961. (*Sir Theodore Morison.*) There was a sufficient number of firms in Calcutta at present to take over the work of the Public Works Department. A large number of Government buildings were built in Bihar and four firms were asked to tender for certain work, and the tender of his own firm was accepted and the firm finished the buildings. He would initiate the policy of entrusting the work to firms in the large towns; there were many firms with sufficient capital and knowledge to undertake it; but he would exclude irrigation and railways and deal only with roads, buildings and bridges.

71,962. (*Lord Ronaldshay.*) The Indian Engineers employed by his firm were of the same standard as the Indians now going into the Provincial Service, because those who could not get into the Provincial Service came to the firm. The salary paid to Indians was from Rs. 100 to Rs. 800, with bonuses to special men for good work. To obtain higher salaries the men had to go to England and pass certain tests. The higher Engineers were almost exclusively recruited in England. The apparent contradiction in the fact that in the firm's business the higher Engineers were almost exclusively recruited in England while he advocated that for the higher department of the State at least one-third should be recruited in India was based on the idea that the Government had to look at things from points of view which were excluded from the consideration of a business firm. To put it briefly, the Government had to consider the Government of the country, and the distinction was made really on political grounds.

(The witness withdrew.)

B. HEATON, ESQ., Principal, Civil Engineering College, Sibpur.

Written Statement relating to the Public Works Department.

71,963. **(I.) Methods of Recruitment.**—(*a*) *In England.*—I have no remarks to offer except that, in my opinion, recruitment in England should be confined to Europeans, and that Indians should be taken from the colleges expressly established in India by Government for the training of Indians for officers' posts in the Public Works Department.

The making of a successful *practical* Engineer depends more upon the experience gained during his apprenticeship to the profession after leaving college, and on his experience in the actual practice of Engineering than on his studies at the college. The facilities available in India for giving suitable practical training are, I believe, greater than in England, and the number of students passing out of Indian Engineering Colleges seeking such apprenticeship is much less than the number passing out of English Colleges who must be provided for in England. Therefore, if we can arrange a thoroughly satisfactory practical training in India, we should produce as good, if not a better Engineer out of an Indian than is likely to be done in England.

In view of the fewer facilities that exist, and of the prior claim of Engineering graduates trained in England, it would be extremely difficult to arrange suitable practical training in England for the graduates of Indian Colleges.

(*b*) *In India.*—Indians for the officer grades of the Public Works Department are trained in India at—

The Thomason College, Rurki.
The Civil Engineering College, Sibpur.
The Civil Engineering College, Poona.
The Civil Engineering College, Madras.

Each of these colleges admits students from a definite area which is laid down by Government.

The sphere of Sibpur embraces the following provinces:—

Bengal.
Bihar and Orissa.
Assam.
Burma.

The area of population within the sphere entrusted to Sibpur compared with the rest of India is one-third nearly in each case as shown in Imperial Gazetteer. A larger proportion than in the case of any of the other Indian Colleges.

Any student, resident within this sphere, who wishes to be trained in India for the officer grades of the Public Works Department must, under Government orders, seek admission to the Sibpur College, and I maintain that the amount of Government partronage offered to the colleges should have some reference to the amount of Civil Engineering enterprise (Public Works Department, Railway, &c.), that is to be found within the sphere entrusted to Sibpur. But this is far from being the case, the allotment of guaranteed Assistant Engineer posts amongst the colleges was till 1913 as follows:—

Rurki	6
Sibpur	1
Poona	1
Madras	1

But since the formation of Bihar and Orissa, the Bihar Government have repudiated the claim that the college possesses (in view of customs) of supplying that Province with Assistant Engineers, and the Bengal Government have informed the Government of India that they can take an *ex*-student each *alternate* year only. This reduction has been sanctioned. So now the guarantee stands at one post every other year which will of course make difficulties in recruiting students for admission in the blank years.

The rules regarding the obtaining of guaranteed Assistant Engineer posts in Assam and Burma by Assamese and Burman students lay down that, in order to obtain such post, the Assam and Burma lad must actually pass the Bachelor of Engineering Examination at the top of the list of merit. Lads of those provinces are never likely to beat the more highly educated Bengali in the Bachelor of Engineering Examination; consequently the officer grades of the Assam and Burman Public Works Department are practically closed to Assamese and Burman students.

Although, however, Sibpur does receive students from Assam and Burma for training, we do not receive any of the patronage of the Public Works Department of those provinces; perhaps they do not wish for Bengali Engineers.

Thirty-two students are admitted yearly to the Engineer classes at Sibpur, the number that pass through and qualify at the end of the four years' course average 11; of these one obtains the guaranteed post and the remainder have to accept what service they can get; this means that (since practically all the Civil Engineering work is in the hands of Government or *quasi*-Government concerns) most of the students have to accept posts in the subordinate services from which it is only few that rise to the officer grades.

One such promotion is guaranteed each alternate year to a Sibpur lad. One or two may become District Engineers after some five or six years. Hence we find that many subordinates possess Assistant Engineer qualifications and consider themselves as

good as their officers. It is not good for discipline, to have so many discontented men.

The struggle for a living and for Government service in Bengal is getting keener every year, and the attraction of even the single guaranteed post offered at Sibpur is such that it has raised the standard of admission. About 25 per cent. of the students now admitted are Bachelors of Science and their actual age about 20. The new age regulations of the Matriculation Examination of the University will affect our Bachelor of Science admissions from and including next year. By these regulations the minimum age on passing the B.Sc. will be 20 on March 1st, and, as our admissions are made on November 1st, the youngest B.Sc. student must be about 21 then and the average older, so that no B.Sc. could pass the B.E. degree (a four-year course) under 25, that is, if he secures promotion each year. The average B.Sc. would be probably 26 or 27, and as he cannot join Government Service until the completion of his year's practical training, he will then be 27 or 28. Students who join the college after passing the I.Sc. Examination would be two years younger, 23 being their possible minimum on joining Government Service. This corresponds, I think, fairly well with English Engineering Colleges.

Bengali students do not appear to be keen on Engineering for its own sake; they are more interested in trying to obtain a Government post. Most of them have applied also for admission to the Medical College and prefer to take admission there, unless they have been awarded a Civil Engineering College Scholarship. They appear to rely largely upon their exceptional powers of memorising, hoping that the chances of mere examination may secure for them a permanent Government post. Hence they would prefer that the guaranteed post should be awarded solely on the results of the B. Examination. They do not want their practical abilities to be judged.

The Bengalis that come to us are practically ignorant of Drawing, and none of them have that popular knowledge of elementary Engineering that is possessed by practically every school boy in England. They are of a more dreamy and philosophical nature, they do not care for work in the workshops and a comparatively small proportion play games. Owing to the unpractical nature of the Bengali, the Public Works Department have been forced to institute a practical examination held at the end of the 12 months of practical training that the students undergo after passing their B.E. Examination.

71,964. **(II.) Systems of Training and Probation.**—This period of training is far shorter than the ordinary apprenticeship a European lad undergoes, and it is far too short to enable the really practical man to show his head above the crowd. It is not every man that passes through an Engineering College in England who ultimately joins the profession, and it is obvious that the proportion of unsuitable Engineering graduates is likely to be higher in India. In England permanent appointments are scarce and, an Engineer, in order to obtain a living, must be a really practical man, so those unsuitable leave the profession at an early stage.

In India (since all Civil Engineering is in the hands of Government or *quasi*-Government concerns) permanent appointments are the rule. Selection for these should not be made until a man has really shown ability as a practical Engineer. It is very probable that one reason why Indian Engineers, in general, have not a good reputation as practical men is, the ease with which unsuitable men are able to obtain and to retain permanent posts.

There is not the same reason for giving a man a permanent post when he is serving in his own country, as in the case of selected Engineers imported from Enrope.

The length of practical training (apprenticeship) should certainly be extended up to three years, increased pay (depending upon satisfactory work) being given in the last two years. Even at the end of this period it is not necessary to offer permanent employment. Selection for the permanent staff should be made on reaching the Executive Engineer rank, Assistant Engineers being employed on temporary terms. This would enable an increased number of Assistant Engineers to be engaged.

Assistant Engineers, not selected for the permanent staff, would have had very sound practical experience, and should be able to obtain ready employment on the Engineering staff of District Boards, Municipalities, &c. Those who have proved unsuitable for the profession would have been discovered at an early stage, they would leave the profession then and would not bring a bad name on the Indian trained Engineer.

If such a method of recruitment be adopted it would give the Indian, who is really an Engineer, a real chance of coming to the front, and would make it easy to select exceptional men for special promotion to the Imperial Service. The knowledge that (as in England) a man's future will depend upon his practical ability as an Engineer, more than on his skill in passing examination tests, will tend to restrict the admissions to the college to lads who have a taste for Engineering, and will tend to keep out the unfit and those more suitable for the medical or other professions.

As noted above, the extremely limited patronage offered by Government to the students of this college has little reference to the sphere entrusted to the college, or to the amount of Civil Engineering construction within that sphere. Increased patronage would attract a larger number of suitable students, and would raise both the prestige of the college and the quality of the output.

Increasing the period of practical training to three years will treble the number of student Engineers under practical training at one time, and may make it difficult to arrange for suitable training.

The Engineers under whom students are placed for training need not be confined to officers serving under Government, but ought to include Engineers serving on railways and with private firms, the Engineer, whether Government or official, being paid a suitable premium for at least the first year's training.

71,965. **(VII.) Employment of Non-Europeans.**—As more suitable training can be provided in India than in Europe for Indians being educated for the Public Works Department, I am of opinion that no Indian should be recruited in England.

In view of the hereditary influences, early environment and unpractical preparatory school training of Indian students, it is not likely that for many years the average Indian will be equivalent to the imported European; therefore I am of opinion that the distinction between Imperial and Provincial Engineers should be retained and that suitable provision should be made for the admission to the Imperial cadre of any Provincial Engineer who may show exceptional merit

71,966. **(VIII.) Relations of the Service with the Indian Civil Service and other Services.**—The Public Works Department (being essentially a professional department) must remain, as at present, independent of the Indian Civil and other services.

Mr. B. Heaton called and examined.

71,967. (*Chairman.*) The witness said he was recruited to the Public Works Department 26 years ago from Cooper's Hill, served four years in the Department and then joined the Civil Engineering College as a Professor. He had been Principal for nearly 10 years.

71,968. There were at present two departments at Simpur, the Engineering Department and the Apprentice Department. In the former there were about 100 students studying for the B.E. degree of the Calcutta University, while in the latter there were about 200 training for the Upper and Lower Subordinate ranks. The students all lived at the college in separate barracks, but did not mix in the college or the workshops. There was a common staff of teachers, but the routine was so arranged that the engineering students had their lectures in the morning and their practical work in the afternoon, while the apprentices had their practical work in the morning and their lectures in the afternoon.

The training of the two classes was not kept as separate as it was at Rurki, and he would like to see a more rigid separation of the students out of class hours so as to obtain a superior class of student.

71,969. It would be to the advantage of the Public Works Department if all who contemplated entering the superior posts were trained at a central college because he did not think Government obtains full value from the four Civil Engineering Colleges now maintained. If civil engineering was to be undertaken by an Imperial department, mechanical engineering, electrical engineering, mining and all higher technical education should be undertaken by the Imperial Government also, even though a central college was not established. The four colleges might be retained, each specialising in a separate subject. He desired to see the Imperial Government undertaking the highest training in all branches of engineering and higher technical training.

71,970. Apart from the students who entered Government service, a certain number became contractors or joined other firms, or went on to District Boards and municipalities, and a large number joined the subordinate ranks of the Public Works Department, some of them becoming, after five years' experience, District Engineers. All the students preferred to obtain Government appointments.

71,971. There was keen competition on the part of students to enter the college. The selection of students was left entirely to himself, and he selected them on their standing in the University examination. It was laid down in the rules that they must have passed the Intermediate examination in Science and have taken both chemistry and physics. An endeavour was also made to ensure that they had some knowledge of drawing. There were about 100 applicants for 40 vacancies.

71,972. His idea was that there should be not one central college but four colleges which he suggested might be devoted one to civil engineering, one to mechanical and electrical engineering, and one to mining, or there might be two colleges for civil engineering if one was not sufficient. The Provincial colleges should retain their present recruitment areas and admit students for a course of about two years. At the end of two years a qualifying examination should be held, conducted by the college authorities and then the students should be allowed to go to one of the special colleges for instruction in one or other particular branch of engineering. Each college would give a grounding in general engineering and would have a special branch of its own. The first two years' training would be of students within the province, but the specialised training would be open to students from all parts of India. It would be a four years' course altogether.

71,973. After the four years' course the students would have to obtain a year's practical training, which could be obtained in India. He did not think it would be possible to arrange for the practical training of students of Indian colleges in England as there were difficulties in the way of getting railways and firms to take them. There was a great deal more civil engineering enterprise going on in India than in England, and consequently a larger number of openings for practical training.

71,974. Students entering the Upper Subordinate Service did not require the same qualification as students going direct into the Provincial Service. The course for subordinates included more practical work in workshops; they were not taken up to the same theoretical standard as the Provincial Service students; the work was essentially practical so that they might be in a position to deal with the workmen they would have to direct. He saw no real objection to such students being trained in the same buildings as the engineering students if separate lectures were provided. In the same building there would be those who were training for the superior posts in their first two years; secondly, those who were specialising in a particular branch, and, thirdly, those who were training for the rank of overseer. It might be advisable to have a separate college for subordinates, but a much more efficient teaching could be obtained by having the students altogether.

71,975. There would be advantages in having the specialised training concentrated in one institution, but that would mean establishing a large technical University for the teaching of civil engineering, mechanical engineering, electrical engineering, mining, etc. Rurki was perhaps not sufficiently equipped for that work; he had not seen Rurki for 5 or 6 years and it might have improved much; but Sibpur might be made into a highly specialised training college if it were better equipped for dealing with larger numbers of students. If the numbers were small it would be almost possible for Sibpur to deal with them now, as the college had the finest workshops of any college in India.

71,976. He was in favour of retaining the division into Imperial and Provincial branches, but would promote exceptional Provincial Engineers to Imperial rates of pay. The education received by the Imperial man in England was in some respects sounder than that obtained in India, as in England a man started with a better educational foundation.

71,977. He proposed that the services of Indian officers in the rank of Assistant Engineers should be temporary and that only officers promoted to executive rank should be placed on the permanent cadre. That would enable the department to be contracted or expanded according to the work that had to be done and he did not think it would give rise to administrative difficulties, though it might raise further invidious distinctions as between Europeans and Indians.

71,978. A proportion of the men recruited to the Overseer grade might, after experience and practical training, be promoted to subdivisional posts.

71,979. He wished to see all Indians recruited in India and would abolish the present system under which 10 per cent. were recruited by the Secretary of State. The Government ought to encourage Indian engineering colleges as much as possible and not cast a slur upon them.

71,980. (*Lord Ronaldshay.*) Of the students in the higher class only one received an appointment in the Provincial Service every two years and most of the students had to accept posts in the subordinate service. The Public Works Department received a certain number of students, both engineering and subordinate, for training, and at the end of the period there was a practical examination conducted by the department with the assistance of a Professor from the college, and on the results of that examination appointments were made to the subordinate service. Although the two classes of students were trained differently they were eventually judged by the test of an identical examination. That a large number of B.E.'s sought employment in the subordinate grades was due to the fact that too many students were admitted to the University course. At present 40 were admitted, and he thought the number should be only 20. The evil was aggravated by the fact that neither Burma nor Assam ever offered any appointments in their Provincial Services to the students, probably owing to the fact that they did not desire to be hampered in their recruitment.

71,981. (*Sir Theodore Morison.*) He had never had any difficulty in obtaining one year's practical training for his students. There was a sufficient number of scholarships available for those who passed the examination and he arranged for their practical training either with the Bengal Public Works Department, or the Public Works Department of Bihar and Orissa or Assam, or with the Bengal-Nagpur Railway and the Eastern Bengal State Railway. The facilities offered by Government were usually sufficient, and it was only when a larger number of students passed that the railways were asked to take them. Students believed that if they went to railways they had not the same chance of obtaining employment under Government. At present the apprenticeship was only for one year and he wished to see it longer. A man was not an Engineer when he had finished his college course, and it was desirable that the apprenticeship should be for at least three years. That would treble the number of students under training at one time, but there would be no great difficulty in arranging for it. No Government Engineer now took pupils with a

premium, but it would be an advantage if he did so, and the student would be willing to pay if he could not obtain training otherwise.

71,982. A scheme was being drafted for a school of mines and he was confident there would be no difficulty in arranging for practical training in mining, as the miners were anxious to get qualified men and would assist in training such men.

71,983. He saw no objection to all Assistant Engineers being employed on a temporary basis.

71,984. (*Mr. Chaubal.*) Rurki although it was allotted six posts provided for a smaller area than the other colleges, Sibpur having the largest recruitment area of any college in India.

71,985. (*Mr. Sly.*) The allocation of posts was made according to the number of vacancies in the Public Works Branch of each province, and probably Bengal had only one appointment, because there was one vacancy on the average every other year. He thought, however, Sibpur should have some consideration on account of its being the college for Burma, Assam and Bihar and Orissa. It was quite possible that some students from Rurki obtained appointments in those provinces.

71,986. Admission to the Sibpur College was limited to Indians and Anglo-Indians from a certain specified area, men from other provinces not being able to obtain admission to the college unless there was a vacancy which could not be filled from the provinces the college represented.

71,987. In Bengal six candidates were sent for one year's probations to the Public Works Department, the first six men on the list having a right to enter for a year's training as part of their college course. For the actual post the final selection was made by the Public Works Department on the result of the practical examination held at the end of the year.

71,988. The qualification for entering the college at present was the Intermediate Science examination. The length of the college course, combined with the increase in the practical training, created an age difficulty, and he wished to be allowed permission to refuse to admit to the college students over a certain age, whether they had read up to the B.Sc. or not, although that might exclude some good students. The educational qualification for admission could not be reduced. Suggestions had been made that the Matriculation should be the educational qualification, but if the standard of a boy passing Matriculation was compared with the standard of a boy entering an engineering college in England, it would be found that the Bengal student would be under very great disabilities, if Matriculation were made an educational standard for admission, because he had had no opportunity in the Bengal schools of specialising towards engineering, *i.e.*, of learning higher mathematics, drawing, science or manual training. The Medical College a short time ago took boys with a Matriculation qualification and lengthened the college course, and in the result Intermediate Science men applied for admission to the Medical College, although the Matriculation examination was the standard, the result being that these lads had to stay a year longer at the Medical College than formerly. The college preferred the Intermediate Science candidate and selected him. The present system of training an Engineer entailed two college courses, the preliminary science course at an Arts or Science college and the final course at the Engineering College, but the standard of the Intermediate Science examination was no higher than the ordinary school leaving standard in England.

71,989. The final examination was conducted by the Calcutta University, which gave no credit for marks awarded at college examinations during the course. There was no physical test and no practical test in workshops, the latter being taken in the Intermediate examination. Of the admitted students about 11 a year passed in the final test. Six competed for Government posts and the remainder the railways were asked to accept. After practical training they had the opportunity of competing for subordinate posts in the Public Works Department, if they wished to take them.

71,990. (*Mr. Fisher.*) The main criticism he had to pass upon the candidates entering the college was their insufficient training in drawing and elementary science. That education could be much better given in Sibpur to students of Matriculation age, but it would necessitate lengthening the course, and the Intermediate Science candidate would be still clamouring to come in for a five years' course, and it would be very difficult to resist the appeal. It was very desirable that a boy, who was being trained for an Engineer, should have a good training in drawing early in life and should be well grounded in science. He would like to catch the students at the Intermediate Science stage.

71,991. The system of combining practical training with theoretical training in a Sandwich system as obtained at some colleges in England was very suitable for mechanical and electrical Engineers, as it was easy to find works where everything was under one roof, but that could not be done with civil engineering. One or two students had gone into private works to study mechanical or electrical engineering during the vacation, but it was very exceptional to do so. The college itself offered a practical training, because there was a very large electrical installation which was maintained entirely by the students.

71,992. He wished to put all the higher technical education under the Government of India, because the outlook of Provincial Governments was limited to the needs of their province. The Bengal Government, for instance, had mining classes, and would develop them in regard to the needs of Bengal only. The present system meant multiplying institutions to such an extent that they would be neither efficient nor economic. There was an advantage in having all the training carried on in one institution, as it widened the outlook of the students, but for this an entirely new technical University for India would be required.

71,993. (*Mr. Madge.*) If the field of practical training was widened at Sibpur and it was possible to get firms such as Sir R. N. Mookerjee's to take some of the pupils for practical training, those pupils would probably obtain as good a practical training as they could get in the Public Works Department or even better. Opportunities existed for training in India, but they were not offered because Indians without exception preferred training under Government.

71,994. At present there were four colleges training Engineers in India, and he suggested that each of them should take up one branch of engineering only in their University classes. That would not mean that before a man could be an all-round Engineer he would have to go the circuit of all the colleges, because it was not necessary that a man should be a good Engineer in all branches of engineering. A student could be given a sufficient amount of general training in the two years he remained in the local college. A similar scheme was in force at Sibpur in connection with apprentices. There were a large number of "feeder" classes in Kurseong, Burdwan, Midnapore, Dacca, Ranchi and many other places, at which students were trained up to a certain stage, and when they reached that particular standard they were offered by the college a choice of civil engineering, mechanical and electrical engineering, and mining, and they could take a special course in either of those branches at the Sibpur College. That system worked very well. The man who went into the Public Works Department took the civil engineering branch, but at the same time he was getting a knowledge of mechanical work in the workshops.

71,995. The ideal would be to have one technical University teaching all branches of engineering, but if that was not possible, the existing colleges might be utilized for specialization in the various branches of engineering. He had put forward his proposal as one which was more likely to be sanctioned as Provincial Governments might not be willing to give up their high grade classes in engineering.

71,996. He did not think any difficulties would arise out of his proposal to employ Assistant Engineers on a temporary basis, as the men would know that after five years or so they would have an opportunity of becoming permanent, and they would do their utmost during the five years to become really efficient. He desired to get away from the principle of guaranteed posts. The system had rather a tendency at Sibpur to make the students study the syllabus with

the object of seeing which were the most mark-getting subjects. They did not come to the college with the idea of becoming efficient Engineers, but with the idea of getting a particular post.

71,997. (*Mr. Abdur Rahim.*) The reason why he considered that Indians should not be recruited in England to the Imperial Service was because Government maintained colleges in India for the training of students for Government service, and students should go to those colleges rather than to England. If Indians went to England, they should give up the idea of getting into Government service. If Government maintained colleges and guaranteed to recruit the services from those colleges the guarantee should be adhered to. If the guarantee was abolished and the Bengal Government said they would appoint a Bangali to the Provincial Service, no matter where he was trained, the position would be much sounder, because every boy who came to the college would come to be trained as an Engineer and not for a place under Government. He would be selected for Government service on account of his efficiency as an Engineer, not on account of his facility in passing examinations. An Indian who had been educated in England might be accepted, if qualified, but there should be no guarantee of admission to the service. If he was equally qualified he should have an equal chance with others. In a central Imperial college he thought it would be possible to create a good social and professional atmosphere and to raise the students to the English standard without their going to England. No doubt England offered a better mechanical and electrical training, as methods there were more up-to-date and there were more extensive works.

71,998. With regard to the difficulty connected with the age of admission to the college, the only suggestion he could make was that no one should be admitted after the age of 19. There should be then a four years' course followed by a year of practical training, which would bring the age up to 24 as the maximum if the students passed through without failure.

71,999. About a fourth of the students in the college this year were B.Sc.'s and three-fourths Intermediate Science. Nearly all the students who applied for admission had already applied for admission to the Medical College or some other professional college, so that it could not be said they came to Sibpur with an inherent taste for engineering.

72,000. (*Sir Valentine Chirol.*) The majority of Indians who went to England for training had already failed to obtain admission to one of the engineering colleges of India. The number of admissions to the colleges in India was strictly limited; for instance, Sibpur could only take 40 in an area comprising one hundred million inhabitants. Amongst those who were unable to get into Sibpur there might be very good men. His main point in objecting to English Engineering training for Indians was his desire to encourage education in India.

72,001. (*Sir Murray Hammick.*) In England practically every student who went to an engineering college had to go through a four or five years' apprenticeship before he had the opportunity of obtaining work. If the same rule obtained in India, there would not be the same complaint about Indian-trained Engineers. At present a student on passing from the college thought that he knew quite enough to undertake at once well paid work and he did not realise his deficiences. An undue value was placed upon the B.A., B.E., and S.Sc. certificates. Students had a very great objection to paying for their experience and also to accepting posts on low pay, arguing that if they accepted such posts it would be said that that was the market value they placed upon themselves, and that if their market value was that of an Overseer, they could hardly expect to receive larger pay afterwards. There was also a difficulty in connection with the students working in outside workshops where lower caste workmen were employed. This difficulty did not obtain in the college workshops. The inefficiency of the Indian Engineer was due in the main, first, to his objection to going in for a practical course; secondly, to the great difficulty of obtaining a sufficiently good practical course in works, and, thirdly, the unsuitable character of the preliminary training before they joined the engineering college. He did not think there was likely to be any very great improvement in those directions so long as the Matriculation examination of the Universities was the be-all and end-all of a student's school career. If there was an examination for students, who had been trained especially for industries, then he believed satisfactory material would be obtained. The opportunities already existed in India for a real practical training in works after students had left the college, but they did not take advantage of them.

(The witness withdrew.)

O. H. Desenne, Esq., Executive Engineer, Assam.

Written Statement relating to the Public Works Department.

72,002. **(I.) Methods of Recruitment.**—Imperial Engineers should be recruited by competition from a Central College in England and Provincial Engineers from one Central College in India.

72,003. **(II.) System of Training and Probation.**—Both Imperial and Provincial Engineers should undergo a year's training in India on some large work which is being carried out by departmental agency. The work need not necessarily be in the province to which the Assistant Engineer will be posted.

72,004. **(III.) Conditions of Service.**—The following recommendations are made:—

(1) That for the "Public Works Department" be substituted the "Public Works Imperial/Indian Service" and Provincial Engineers who reach administrative grades be absorbed in the Imperial Service.

(2) That free medical attendance be provided for the families of officers.

(3) That the travelling allowance rules be reconsidered, especially as regards (1) travelling by inland steamer, (2) expenses on transfer, (3) travelling allowance of Assistant Engineers.

(4) That administrative appointments be made and controlled by the Goverment of India.

(5) That the interest of Public Works Department officers be safeguarded against supersession by Royal Engineer officers.

(6) That the cost of the site for a residence shall be fixed without reference to its actual cost due to local variations in the price of land or to special circumstances, and shall be a fixed percentage of the cost of the proposed residence.

(7) That Engineers shall obtain a reduction in the fees payable for the education of their sons in the Central Training Colleges if established in England or in India.

(8) Superintending Engineers like Conservators of Forests should be Heads of Departments (except in cases where they are under the orders of a Chief Engineer who is not a Secretary to the Local Government or Administration) as their responsibilities are at least as great. The Chief Engineer's duties would then not be diffentiated from those of a Secretary to the Local Government or Administration.

(9) That temporary Engineers should not be placed in charge of permanent Public Works Division; they should only be employed in accordance with their designation in charge of temporary divisions or as technical experts and their functions should never be administrative.

72,005. **(IV.) Conditions of Salary.**—The pay of Provincial Engineers should be raised to $\frac{3}{4}$ of that of the corresponding ranks in the Imperial Service.

Provincial Engineers promoted to administrative grades should get the same pay as Imperial Engineers. The pay of Imperial Engineers has recently been increased, and a married officer can now only just manage to make both ends meet.

The attached (*vide* Annexure) shows the estimated percentages of expenditure of a married officer in the executive grades who regulates his expenditure

in a rational manner under the existing conditions of service.

72,006. **(V.) Conditions of Leave.**—Proposed:—

(1) That the period of service qualifying for leave be reduced to 4 years.

(2*a*) That furlough allowance be ½ of the average salary in India.

(2*b*) That furlough allowance be ½ of the average salary out of India with a minimum of £300 for Imperial Engineers.

(3) That there should be the option of taking short—six months—leave out of India on full pay after four years of uninterrupted service—three months to be treated as privilege and three months as equivalent to six months' furlough.

(4) That twelve months' study leave in the whole service with the necessary safeguards and allowances be given, in addition to all furlough admissible under the rules.

(5) That privilege leave be assimilated to furlough in the matter of carrying on to an officer's credit leave which he is prevented by the exigencies of the service from taking.

72,007. **(VI.) Conditions of Pension.**—That pensions should be improved on the lines proposed in the petitions recently submitted by Imperial Engineers to the Government of India, but preferably in the case of new recruits pension should be replaced by a provident fund on the lines of the State Railway Provident Fund, officers subscribing a fixed percentage of their pay, to which Government should contribute an equal amount, the accumulations to be the absolute property of the subscribers and their heirs. On retirement an officer should have the option of withdrawing the accumulated amount of his own deposits and draw interest till his death on the balance, when it would be paid to his estate. In this way an officer will be certain of getting his pension or deferred pay and he will be able to make some provision for his family. For officers who are already in the service of Government a widow's pension of £100 a year should be allowed by Government.

72,008. **(VII.) Limitations in the Employment of Non-Europeans and the working of the existing system of division of Services into Imperial and Provincial.**—The number of Provincial officers as at present recruited is, owing to the laws of supply and demand, and market values, a measure of the inefficiency which the Government of India are prepared to condone; and the proportion of such officers must be determined accordingly. The fact that private concerns find it necessary to employ the services of men whose qualifications correspond to those of Imperial Engineers, on a salary higher than that which the local supply of Engineers trained in Indian Colleges would be prepared to accept, proves this point.

The Imperial Service should be filled only by recruits appointed in England, facilities being given if necessary to Indians, in order to enable them to compete on even terms with Europeans.

72,009. **(VIII.) Relations of the Service with the Indian Civil Service and other Services.**—If this enquiry is directed to conditions of social intercourse—these are eminently satisfactory. The roads and buildings branch is however subjected to unfair criticisms owing to unsatisfactory results and delays which are often due to a course of action being pursued over which this Department is not at present in a position to exercise its veto. This Department is second to no other in its efficiency, but the scope of its functions is not generally understood and its position in relation to some of the other departments and services requires strengthening.

Annexure (*vide* 72,005).

	Per cent.
1. Medical attendance, including midwifery cases and medicines ...	2½
2. General Provident Fund subscription	12½
3. Income tax	2½
4. Life Insurance	10
5. Provision for 9 months' leave (3 months' privilege and 6 months' furlough every six years, including passage)	10
6. House rent	10
7. Household expenses, including servants, food, furniture, clothes ...	40
	87½

This leaves 12½ per cent. for the club bill, education of children, purchase of horses or other means of conveyance, subscription lists and contingencies, and is inadequate.

The above applies to the average salary of the married officer drawing Rs. 1,000 per mensem, and those drawing less or more are comparatively worse or better off, as the percentages of some of the above items 4, 5, 6, and 7 need not necessarily be increased in direct proportion to the larger pay.

Mr. O. H. Desenne called and examined.

72,010. (*Chairman.*) Witness had been in the service for 15½ years. He represented about 17 Engineers, and his views generally represented those of the Imperial engineering service in Assam.

72,011. He proposed that Imperial Engineers should be recruited by competition from a central college in England, not because the present system of nomination by the Secretary of State had given unsatisfactory results; the suggestion was put forward chiefly on the ground of *esprit de corps*. In a department like the Public Works Department *esprit de corps* was a very valuable asset; and there was much apprehension that that spirit was gradually disappearing under the present system of appointments. There was also the question of the training of Indians in England, which seemed to present great difficulties. With the establishment of a central college those difficulties would disappear.

72,012. He suggested that all Indians, who were admitted into the Imperial Service, should be trained in England. He said that partly from the result of experience, and also from the point of view of market value. A Provincial Engineer with an Indian training drew, on an average, less in the open market than the home man with qualifications equal to those of the Imperial Engineer.

72,013. He had come in contact with Indians who had been trained in England, and they made much better Engineers than those trained in India. It was necessary that Indians should go to England to be trained.

72,014. He had but very little experience of Indian colleges, although he had had both Rurki and Sibpur men under him. Personally he preferred the men from Rurki.

72,015. He knew his view as to the inadequacy of training in Indian colleges was very different from that which had been put forward before the Commission by several responsible witnesses.

72,016. Assuming that Indians were to be trained in India, he considered that it would be advisable to have a central college, in preference to colleges in each of the various provinces, because the different races would be more blended together, and the rough corners would be sheared off more readily.

72,017. He recommended a year's training in India for both Imperial and Provincial Engineers, on work which was being done departmentally. There was a great deal of difference between work which the Public Works Department did by contract, and work which it did departmentally, where there were no contractors, and where the department looked into the details, and did the actual work itself. He agreed it was important that young officers should be placed on some big constructional work, and not on ordinary routine work. It was not always the case that big constructional work was put out to contract. The witness himself had carried out fairly big works departmentally. His reason of suggesting a year's training in India was that it gave a young officer the opportunity of coming into contact with men with whom he would have to deal for the rest of his service. It would also enable

him to learn the language and the various conditions of the country.

72,018. The present average age of men coming into the service was 25, which he thought was a little too advanced; 23 would be a very good average age.

72,019. He was strongly of the opinion that the interests of the officers in the department should be safeguarded against supersession by Royal Engineer officers. He thought the latter should come in at the bottom of the list, so as not to supersede those already in the service. At the present time Royal Engineer officers were placed over the heads of several civilian Engineers on the list. The complaint was not so acute as it had been in the past, and his colleagues were not complaining so much against what was happening at present; all they required was a safeguard against any revival of the past system. In Assam there were two Royal Engineer officers.

72,020. With regard to pension, the witness endorsed the proposals which had been put forward in the petitions recently submitted by the Imperial Engineers, but in the case of new recruits he recommended the replacement of pensions by a provident fund, which he thought was more satisfactory. Under the present system many Chief Engineers had died in harness, thereby losing their pensions. He would like to see a system in vogue similar to the State Railway Provident Fund. That, as at present organised, gave larger benefits than the present non-contributory pensions. His chief reason for putting forward the suggestion was that it would ensure some sort of provision for the widow of the officer. He thought for officers who were already in the service, Government should allow a widow's pension of £100 a year, in addition to the increased scale of pensions mentioned in the Imperial Engineers' petition.

72,021. (*Sir Murray Hammick.*) He suggested that administrative appointments should be made and controlled by the Government of India, because if promotions were made on one general list for the whole of India and men could be transferred to other provinces, it would minimise blocks in promotion, and neutralise differences in the rates of promotion due to separate sanctioned cadres for each province.

72,022. (*Sir Valentine Chirol.*) Questions coming within the purview of the Secretary to Government (Public Works Department) were very often dealt with to a certain extent by other departments. It was not a very crying abuse, or a matter of paramount importance, but at the same time it would strengthen the position of the Public Works Department if it was understood that all orders of the local administration regarding Public Works Department matters should be dealt with only by the Public Works Department. He did not agree that it would possibly strengthen the position of the Public Works Department at the expense of the Local Government; the Public Works Department was part and parcel of the Local Goverment; but it might strengthen the Public Works Department Secretary at the expense of other Secretaries.

72,023. (*Mr. Madge.*) He thought the establishment of a central college in India for Provincial Engineers was quite a practicable proposal. He would not abolish the existing Provincial colleges; he would have one central college for higher engineering, and let the local colleges remain for the lower engineering training. He agreed that there were other services, which were recruited otherwise than through a central college, which still retained their *esprit de corps*, but he did not think that spirit was quite so well developed as it would be with a central college.

72,024. In Assam the Public Works Department gave out a lot of work to petty contractors. There were very few large contractors. The department had the supervision of all work done.

72,025. The Secretariat of the Public Works Department was not strong enough. For instance, they were constantly told by the Secretary of State for India that they must not on any account purchase European stores locally. In the face of that, it was found that large quantities of European stores were purchased locally, and the Public Works Department was blamed.

72,026. The reason was there was a rush, the work had to be done, and there was no help for it under the existing system. In many similar instances, very much against the wishes of the Public Works Department, rules had to be broken owing to the Public Works Department not being strong enough, *e.g.*, "sanctioned amounts of schemes and projects being exceeded owing to their scope being widened under the orders of other departments." It was true that the Chief Engineer was Secretary to Government, but he had distinct duties as Chief Engineer, and distinct duties as Secretary. While he was Secretary on the one hand, on the other he was merely head of a department, whereas the other Secretaries were purely Secretaries and nothing else.

72,027. (*Mr. Fisher.*) The proposal that the pay of the Provincial Engineer should be raised from two-thirds to three-quarters of the pay of the Imperial Engineer was simply put forward as a concession to the Provincial Engineers. He did not wish to imply that in the case of the average Provincial Engineer the standard of living had risen in proportion to the increase of pay suggested. He proposed they should be paid something above the market rate, in order to produce more contentment in the service.

72,028. He thought the majority of the Assam Engineers were of the opinion that Englishmen coming out into the service should undergo a period of probation in India. That was not because they had had experience of the evils of the opposite system, of bringing out people and of not submitting them to any period of probation. He did not find that young men who came out from England without any knowledge of India maltreated their native subordinates. As a matter of fact, these officers were always kept under very strict supervision for the first year, simply being given opportunities of getting acquainted with the language and local conditions; they did not have much chance of getting into mischief, even if they were so inclined. He had had some experience of Indians who had been sent out from England, and he should say that they stood on a much higher level than Indians who had simply passed through the Indian colleges.

72,029. (*Mr. Sly.*) Government should have the right to reject an officer at the end of the year's probation, if it was found that his probationary training had not been satisfactory. It was possible that the chances of being thrown out of employment after a period of probation might affect recruitment in England, but he did not think it would interfere with Indian recruitment. If Government were to guarantee a return passage to a rejected candidate, the effect on recruitment in England would be much less. He would not be prepared to go a stage further, and say that all Engineers wishing to enter the Public Works Department should be, in the first place, recruited temporarily under a five or seven years' contract, and should then either go back to England, or be appointed permanently for service in India. It was much better to have a man permanently engaged from the very beginning. He had had experience of two Engineers who had been brought out for a period of years, and they had turned out very good men, but he did not think such a method of recruitment would be suitable for the Public Works Department. The objection to it would be that men would not go in for solid work, but would confine themselves to "eye-wash," and simply do superficial work which would strike the eye. The result would be that the more solid work of the department would suffer. He quite agreed it was the case that practically all engineering service, other than the engineering service of India, was on short-term contracts, but the work of the Public Works Department was quite different. There was a great deal of administrative work to be performed over and above the technical and detailed work. Over and above this there was no difficulty in the case of private firms in getting rid of undesirables, but in Government service a strong case of inefficiency would have to be made out before a short term contract man could be sent back.

72,030. The Assam Provincial Service was not recruited from Sibpur, but from Rurki. There was promotion from the Subordinate into the Provincial Service in Assam. This system worked very satisfactorily. He certainly would not desire to see it abolished.

72,031. (*Sir Theodore Morison.*) It was the fact that many men in the Public Works Department did pay as much as 10 per cent. of their salary for life insurance.

72,032. (*Lord Ronaldshay.*) The proposal made in the report of the conference held at Shillong to the effect "that the rule under which increments are withheld, if an officer does not obtain charge of a division, should be made inapplicable to cases where a divisional charge, or post equivalent to a divisional charge, is not available for an officer who has been reported fit for such a charge" was not included in the subsequent written statement because the witness had heard that the recommendation had practically been given effect to. He would not be prepared to guarantee that that was the fact, but that was the reason why it was not put into the subsequent written statement.

72,033. (*Mr. Sweet.*) He insisted on the year's training in England for Indian-recruited Engineers, chiefly because of the wider outlook which they would obtain in this way. There mere fact of walking in a London street widened the outlook of an Indian.

72,034. (*Mr. Watkins.*) In his experience, an Indian trained in England was quite good enough for the Imperial Service. He agreed that a training at home was not the only requisite, but it certainly was one which was absolutely necessary.

(The witness withdrew.)

F. H. Hodgkins, Esq., District Engineer, Assam.

Written Statement relating to the Public Works Department.

72,035. **(I.) Methods of Recruitment.** — The superior grades of the department are recruited in four ways:—

(*a*) By importing recruits from England, including Royal Engineers.

(*b*) By appointment of the successful candidates from the Engineering Colleges in India who secure guaranteed appointments by open competition.

(*c*) By translating temporary Engineers, wheresoever secured, to the permanent list.

(*d*) By the promotion of selected officers from the subordinate grades of the Public Works Department.

Recruits from England are appointed by a Selection Committee at the India Office without competition. The annual recruitment from England has increased. The numbers during a series of years (*vide* the reply given in the House of Commons on the 19th April 1911) are as follows:—

1908	39	Average 30·5.
1909	30	
1910	30	
1911	23	

The annual recruitment in India is approximately 14, viz., 9 for the successful candidates of the Indian Engineering Colleges and 5 for selected upper subordinates.

The proportion of recruits from England and India, respectively, is therefore 2 to 1, or of recruits from England and of the Indian Engineering College men, is as 7 to 2, that is say, only 23 per cent. of the annual recruitment (excluding promoted subordinates) is obtained from the Indian Engineering Colleges. In other words, 77 per cent. of the total annual recruitments is made by selection and only 23 per cent. by open competition. This proportion of recruitment for the Indian Colleges, which, be it remembered are institutions maintained at great cost to the State, is thus very small as compared to that from England.

This proportion of recruitment should be contrasted with that existing at the time of the Public Services Commission of 1886-87, and the recommendation of that Commission. It will be noticed (*vide* page 362 of Appendix O of the appendices to the report of that body) that the annual recruitment from England and the Indian Colleges was at that time in the proportion of 21 to 9, that is to say, the Indian Colleges received 30 per cent. of the annual appointments. It is, therefore, manifest that, notwithstanding the fact that the said Commission recommended a gradual increase in the number of appointments to be given to the Indian Colleges, by reducing the English recruitment, the reverse has been the practice.

It is my opinion that the legitimate aspirations of the public in this country cannot be satisfied unless a greater proportion of the superior appointments in the Public Works Department is reserved for competition in India. I would suggest as a suitable remedy that at least 50 per cent. of the total annual recruitments be made in India for the present, and that this proportion should be gradually increased as conditions change. I think, moreover, that of this 50 per cent., at least 10 men should be promoted by selection from the Upper Subordinate grades.

Again, as regards the system of recruitment in England, the method of selection should be discarded for a system of open competition. This system already prevails in India, and as an alteration I would suggest the creation of an Imperial College in place of the four existing provincial institutions. The advantages of this system are sufficiently obvious and need not be enlarged upon.

72,036. **(II.) System of Training and Probation.**—*TRAINING.*—(*a*) *Of Men recruited from England.*—There is no guarantee that the preliminary training obtained by these recruits is such as to meet the requirements of India. The training should be specifically directed to one special end, viz., the efficient performance of duties in India, and the curriculum should include one Indian language.

The only remedy is a special Engineering College, in which the desired training shall be given, similar to the Royal Engineering College at Cooper's Hill. But steps must be taken to ensure that the competition between candidates undergoing such training shall be real, that is to say, the appointments offered must not in any year exceed a fixed proportion of the competing candidates. A suitable arrangement would be that the appointments offered should not exceed one-third of the number of candidates.

This suggestion is not an unreasonable one, when considered with the conditions frequently prevailing in the Indian Engineering Colleges. For example, it has happened at Rurki that 18 to 25 candidates have competed for 5 or 6 appointments: again, at the Poona College of Science it has happened that no less than 40 to 50 candidates have competed for one single appointment.

(*b*) *Of Men recruited from Indian Colleges.*—The training imparted in these institutions is, I think, sound and fairly exhaustive. It is directed wholly and solely to the requirements of India, and the Government can, at any time, introduce any changes as may be required, since these institutions are maintained by the State. In addition, the Indian College Engineer has the advantage of receiving his training in the country in which he has to practice his profession.

PROBATION.—The training received by men from the Indian Colleges is further supplemented by a period of training on probation for one year in the Department, which is not the case with recruits obtained from England. This probationary period in the Department is necessary and should be insisted upon as an indispensable condition, and should be a period of probation in the strictest sense, involving selection and the possibility of rejection at the end of it. Any plea that this is unfair or will deter candidates from England, may be met by the provision of free return passages to rejected probationers. This, minus the free passage, is exactly what prevails at the present moment in the case of recruits from Rurki.

72,037. **(III.) Conditions of Service.**—The conditions of service between recruits appointed in England and India vary considerably, and this is the

cause of the great discontent which prevails among the latter class of officers. Notwithstanding the fact that both classes of officers are recruited for and required to do the same work, and bear the same responsibilities, the position of officers from England is more favourable in every respect as compared with that of the officers recruited in India. This policy which has prevailed since the date when effect was given to the recommendation of the Public Service Commission of 1886-87 has not, I think, been for the good of the Department.

72,038. **(IV.) Conditions of Salary.**—The pay of the Indian recruited element is approximately two-thirds of that granted to men recruited in England. This I consider is unfair. This distinction should, I think, be abolished and there should be no difference in pay between officers who do exactly the same work and have the same responsibilities.

72,039. **(V.) Conditions of Leave.**—Here again there is much disparity between the conditions prevailing, as regards both these classes of officers. Great stress has been laid on the advantage to be derived by an Engineer in visiting foreign countries; unless the conditions of leave are the same for both classes of officers, it becomes impossible for Indian trained men even if they desire to do so, to secure the same advantage in this direction as the English trained men.

Again, the nature of an Engineer's duties in the Public Works Department involves continued exposure and bodily discomfort for long periods, and the health of an Indian trained officer suffers equally with that of an imported man. There is, therefore, no reason whatever to perpetuate the present distinction. The Indian College Engineers should, therefore, receive exactly the same leave conditions as their contemporaries recruited from England.

72,040. **(VI.) Conditions of Pension.**—Here again there is an unfair distinction (*vide* Article 636, Civil Service Regulations), which will create invidious and unjust anomalies. For example, an Indian-trained Chief Engineer will draw less pension than his own subordinate recruited from England.

It is a well-known and universally established principle that pensions are granted as a retiring provision for specific services rendered to the State, and it is therefore illogical and unjust to create or maintain any distinction in this direction between persons who have in fact rendered exactly the same service to the State. In other words pensions ought to be wholly and solely dependent on specific services rendered and not on place of original recruitment for this does not involve any special merit.

72,041. **(VII.) Limitations in the Employment of Non-Europeans and the working of the existing system of division of Services into Imperial and Provincial.**—(*a*) As argued above the Department should be recruited half from England and half in India, for the present.

(*b*) The separation of the Public Works Department into Imperial and Provincial sections is very undesirable when it is remembered that both classes of officers do exactly the same work and bear the same responsibilities.

The ultimate result will, in my opinion, greatly injure efficiency and already causes great discontent. The conditions of work and responsibilities being, as they are, equal in all respects, the confirmation of the differentiation in the matter of pay, &c., would not be fair.

It is therefore urged that Indian College trained men be restored to the position formerly occupied, that is to say, it should be one service, for all the Public Works Department. The proportion of Indians recruited both in India and England should, I think, not be changed.

72,042. **(IX.) Other Points.**—*System of appointing Temporary Engineers.*—This might be improved. At present these appointments are made from various sources, viz.:—

(*a*) Indian trained and qualified Engineers, who fail to secure guaranteed appointments when competing for them.

(*b*) Engineers imported from England under covenant.

(*c*) Unqualified persons appointed in India.

Except where special experts are required, Temporary Engineers' appointments should, I think, be filled solely from the Engineers of the Indian Colleges, and until such time as this source of supply is exhausted no unqualified persons should be entertained. Again there is considerable room for improvement in the conditions of service of Temporary Engineers. These officers are liable to be discharged with very limited notice, irrespective of the length of their service. I would suggest that such service be regarded as permanent non-pensionable, and should have a time-scale of pay, as is the case with Permanent Engineers.

Local allowances.—Indian recruited officers receive two-thirds of the local allowances granted to officers from England. This difference is not fair, for the said local allowances are always given for a specific purpose, that is, as compensation for local disabilities which equally affect both classes of officers.

Probationary period.—Not only have Indian trained officers to undergo a probationary period and thereby incur the consequent risk of rejection after receiving years of special training, which is not the case with imported officers, but even after completing such probation, the period so spent is not counted for promotion in the Department. This is a distinction which I think should be abolished.

Mr. F. H. Hodgkins called and examined.

72,043. (*Chairman.*) Witness had been 20 years in the service. His present position was that of District Engineer at Chittagong. He represented the only three provincial officers in Assam.

72,044. His view was that the division into Imperial and Provincial branches should be broken down, and he suggested that 50 per cent. of the total number of annual entrants to the superior engineering service should be recruited in India. He put that forward on the ground that Indian trained Engineer was as efficient as the European trained Engineer. Fifty per cent. was a sufficient increase on the pr sent proportion. He thought that figure should be gradually increased as conditions changed. He meant by that, that if the 50 per cent. was adopted, and it was found to be a success, and the training in India went on being improved and the necessity for men from England was diminished, recruitment in India might be increased.

72,045. He recommended the establishment of an Imperial College in India in place of the four existing permanent institutions. He did not think a central college would have an adverse effect on recruitment from any of the provinces. He suggested the absolute abolition of the existing institutions, as he thought the Imperial college could efficiently train both for the Imperial and Provincial Services, including the subordinate ranks. It would mean the college staff would have to be very much enlarged, but that the additional staff required could be transferred from the colleges which it was proposed to abolish. He thought it would be a suitable arrangement that all subordinate candidates from the various provinces of India should congregate at one central college. He did not think there was much objection in the fact that they would have to come from one end of India to the other to be trained. He would lay down a rule that candidates for entry to the proposed Imperial college, before competing for admission, should have graduated at the University of Calcutta or Allahabad, and that the subordinates should have passed the Matriculation examination. He would keep subordinates separate from the Imperial candidates.

72,046. With regard to pay, he considered it unfair that the salary of Indian recruited officers should be less than that of officers recruited in England, because the former did similar work, and under-

took the same responsibilities as the latter. He would not say that the market value varied as between the officer who came from a distance and the officer who was recruited in his own country. If the principle were laid down that something in the nature of a foreign service allowance should be granted to all European imported officers, it would be quite a fair arrangement. This foreign allowance should only be sufficient to cover the cost of the voyage to and from England when on leave, and if it were kept quite separate from salary, it would largely remove the present discontent.

72,047. He suggested that service as temporary Engineer should be regarded as permanent non-pensionable service; if temporary Engineers obtained a pension, he thought they would be more satisfied with that than with any other proposal. He agreed that it was better for temporary Engineers to be employed on fairly temporary work, and for strictly limited periods. There were no temporary Engineers in Assam, except when big works were being undertaken.

72,048. In regard to the establishment of a Family Pension Fund, he would like to see some arrangement by which a widow and the family could be provided for, and the pension earned by an Engineer not entirely lost in the event of his death.

72,049. As to leave, and the disparity between the conditions prevailing between the two services, he agreed that his proposal rather pointed towards the grant of greater facilities for study leave. At the same time he maintained that there should be no difference in leave earned by Indian recruited or imported Engineers. If privilege leave was earned and it so happened that a man could not take it, he should be allowed to accumulate it up to six months.

72,050. (*Lord Ronaldshay.*) The discrepancy between the statement in the written statement, that the annual recruitment from England had increased, and the figures, which showed that as a matter of fact it had decreased, was explained by the fact that he had taken the average for the four years mentioned, and had compared it with the average of another four years, some years ago. Paragraphs 3 and 4 of his written statement should be read in connection with these figures.

72,051. He did not think it would be reasonable to take the foreign service allowance into consideration when a man's pension was being assessed. That was the reason why he thought it should be called an allowance. While he would admit the reasonableness of granting men a foreign service allowance during the period of their service in India, he would only give them the same pension that the Indian recruited officer was entitled to. He did not suggest for a moment that the pay of a man recruited in England should be reduced, but that he should be given a foreign service allowance over and above what he was drawing at the present time.

72,052. (*Mr. Sly.*) He considered the present prospects did not attract sufficiently good men into the Provincial Service, at least as regards Anglo-Indians. Despite the evidence given by the Principals of the colleges, namely, that there was great competition to enter the colleges, and that there was an ample supply of candidates of every kind, he still maintained that the service was getting unpopular.

72,053. (*Mr. Fisher.*) The principal reason of that unpopularity was that a man in the Provincial Service held charge of a division which he had probably taken over from an Imperial man, but was given a lower scale of pay. Moreover, it sometimes happened that an Imperial Assistant Engineer working under a Provincial Executive Engineer drew more pay than the latter. The same applied to Provincial Superintending Engineers and Imperial Executive Engineers.

72,054. The rates of pay offered by District Boards were higher than those enjoyed by the Provincial Service. It was not his view that a good young student from Sibpur or Rurki would prefer to be employed by a District Board than by Government, because in the latter case there was the advantage of a pension, and permanent employment, and to that extent Government service was more attractive than private service. He did not know whether it was the fact that the first man from Sibpur always accepted a Government appointment if he could obtain it.

72,055. (*Mr. Madge.*) Local requirements were very different from requirements in England. The locally trained man had the advantage of being thoroughly acquainted with the language, he could get along with his labour better, and he knew the habits of the Indians much more intimately than a man who had just come out from England. For a year at least, a recruit from England could not be very useful. As far as the qualifications of men recruited in England were concerned, there was nothing to complain about; it was simply that the conditions under which they had to work in India were quite foreign to those to which they had been accustomed in England.

72,056. The members of his service would be willing, he thought, to have their furlough reduced, if they could get six months' privilege leave on full pay.

72,057. (*Sir Murray Hammick.*) The witness was recruited to the department from Rurki 21 years ago. He did not know how many other officers were recruited from Rurki in that year.

72,058. (*Mr. Sweet.*) The scale of pay of Provincial Engineers was quite insufficient, and this grievance was aggravated when for the same duties and responsibilities Imperial men received more pay. He did not think his proposal, if acceded to, would eventually saddle the country with an engineering service paid very much in excess of what was really necessary.

72,059. (*Mr. Watkins.*) He passed into the service from the upper subordinate ranks. After a period of work as an upper subordinate, he was promoted, under the existing rules, to the Provincial Service. He was not trained as an Engineer in Rurki.

(The witness withdrew.)

At Calcutta, Wednesday, 7th January, 1914.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

THE EARL OF RONALDSHAY, M.P.
SIR MURRAY HAMMICK, K.C.S.I., C.I.E.
SIR THEODORE MORISON, K.C.I.E.
SIR VALENTINE CHIROL.
MAHADEV BHASKAR CHAUBAL, ESQ., C.S.I.
ABDUR RAHIM, ESQ.
WALTER CULLEY MADGE, ESQ., C.I.E.
FRANK GEORGE SLY, ESQ., C.S.I.
HERBERT ALBERT LAURENS FISHER, ESQ.

And the following Assistant Commissioners:—

H. H. GREEN, ESQ, Superintending Engineer, Bengal.
SHASHI BHUSHAN MAZUMDAR, Executive Engineer, Bengal.
B. M. SAMUELSON, ESQ., Executive Engineer, Burma.

R. R. SCOTT, ESQ. (*Joint Secretary*).

L. W. LEWIS, ESQ., Executive Engineer, Burma.

**Written Statement relating to the Public Works Department, being the corporate opinion of Officers in Imperial Service of the Public Works Department in Burma:—*

(i) *Recruited from the Royal Indian Engineering College, Cooper's Hill and* (ii) *Appointed by the Secretary of State for India.*

72,060. **(I.) Method of Recruitment.**—The present system of selection from qualified applicants should be continued. Candidates for appointment should have taken the Honours Degree or Diploma of some recognised Engineering College and should be required to obtain a nomination from the Head of their College. There would be no limit to the number of these nominations and final selection would be made by a Selection Committee. The present age limit is suitable.

A Special Selection Committee should be appointed annually to deal with applications for appointments to be made that year. At least one-third of the members of this Committee should be senior Officers of the Indian Public Works Department either still on the active list or only recently retired. Candidates rejected should not be eligible for appointment in subsequent years.

Special attention should be given to the general character and social qualifications of the candidates in order to fully maintain the high standard of the Department. Such special qualifications are essential for Officers who will be required to deal extensively with the other departments both Civil and Military and to command the trust and respect of the Natives of the country.

In order to assist the Selection Committee in choosing the candidates most likely to fulfil the special requirements of the Indian Service the Heads of Colleges should be asked to submit to them a confidential report on the general character and special qualifications of each candidate nominated by them.

72,061. **(II.) System of Training and Probation.**—A period of training on works in England is not of much value and should not be insisted on. The conditions under which work is carried out in India are so entirely different that it is better to give every officer appointed in England one year's training on works in India after appointment so that he can learn Indian conditions and study the vernacular language.

It is not advisable to introduce a period of probation after appointment owing to the practical difficulty of making such a safeguard an effective one, while its introduction would probably have an adverse effect on the recruitment.

The Departmental professional examination provided for by Public Works Department Code, Volume I, paragraphs 167 to 169 should be made a thorough practical test of Departmental efficiency and there should be no hesitation in stopping the increments of an officer who is unable to pass this examination satisfactorily within three years of joining his appointment.

72,062. **(III.) Conditions of Service.**—The rule contained in Article 649, Civil Service Regulations, requiring all officers of the Public Works Department to retire on attaining the age of 55 years should be rigidly enforced and extensions of service beyond this age should not be given in appointments against the Cadre as such extensions block the promotion of other deserving officers.

All officers who on reaching the age of 50 years have not attained to the rank of Superintending Engineer should be compulsorily retired under Civil Service Regulations, Article 649, unless they are reported as fully qualified for the post of Superintending Engineer.

No Chief Engineer should be permitted to retain the same appointment for more than five years.

According to the present rules introduced with the incremental scale of pay, an officer of the Imperial Service cannot draw more than Rs. 800 per mensem unless he is in charge of a Division or a charge which in the opinion of the local Government is of equal importance. It seems unjust that the increments of an officer under the incremental scale of pay should be stopped owing to a block in promotion caused by errors of recruitment. The rule should be altered to the effect that an Officer of the Imperial Service cannot draw more than Rs. 800 per mensem unless in charge of a Division or reported on as qualified for the charge of a Division. As the rules now stand it seems that a fully qualified officer of ten years' service for whom no Division was available would not only lose an immediate increment but would also lose service for future increments.

72,063. **(IV.) Conditions of Salary.**—In 1908 the pay of the Public Works Department was re-organised and placed on an incremental scale but at the same time the Exchange Compensation Allowance formerly given to Officers of this Department was withdrawn so that the actual increase then made in the emoluments of the Department was not nearly so large as

* The statement was signed by Mr. F. St. G. Manners-Smith and Mr. G. C. Stawell, for Officers representing Imperial section from Coopers Hill, and by Mr. R. Stanley Baker, for Officers representing Imperial section appointed by Secretary of State.

it appeared to be as is shown in the tabular statement below—

Year of Service.	Old Grade Pay.	Ditto including Exchange Compensation Allowance.	Present Incremental Pay, 1908.	Net increase given by 1908 Scheme.
	Rs.	Rs.	Rs.	Rs.
1	350	372	380	+ 8
2	350	372	420	+ 48
3	350	372	460	+ 88
4	450	478	500	+ 22
5	450	478	540	+ 62
6	450	478	580	+ 102
7	450-550	474-584	620	+ 102+36
8	550	584	660	+ 76
9	550	584	700	+ 116
10	550	584	750	+ 166
11	550	584	800	+ 216
12	700	744	850	+ 106
13	700	744	900	+ 156
14	700	744	950	+ 206
15	700-850	744-903	1,000	+ 256+97
16	850	903	1,050	+ 147
17	850	903	1,100	+ 197
18	850	903	1,150	+ 247
19	850	903	1,200	+ 297
20	1,000	1,062	1,250	+ 188
23	1,050	1,116	1,250	+ 134
27	1,100	1,169	1,250	+ 81
		Administrative Grades.		
S.E., 3rd	1,500	1,594	1,500	— 94
S.E., 2nd	1,750	1,859	1,750	— 109
S.E., 1st	2,000	2,125	2,000	— 125
C.E., 2nd	2,500	2,656	2,500	— 156
C.E., 1st	2,750	2,922	2,750	— 172

The continued rapid increase in the cost of living both in India and in England indicates that it will not be long before a further revision of the scale of pay will be necessary.

Under the old scale of pay Executive Engineers, 1st grade, could be granted two increments of Rs. 50 on completing four and eight years, respectively, in that grade thus raising the maximum pay of an Executive Engineer to Rs. 1,100 obtainable after not less than 27 years' service.

Under the incremental scale of pay introduced in 1908, the increments of an Executive Engineer cease after the 20th year although he is not likely to attain the rank of Superintending Engineer till he has completed at least 25 years' service. Executive Engineers of over 20 years' service should be given biennial increments of Rs. 50 counting from the date of the last increment and subject to the maximum limit of Rs. 1,400 which would be reached after completing 25 years' service. These special increments should be conditional on the officer being reported as qualified for promotion to Superintending Engineer rank, but the grant of the increment would not give the officer any prior claim to such promotion.

In the case of Administrative grades the re-organization scheme of 1908 actually entails an appreciable reduction in the pay and allowances attached to these appointments owing to the withdrawal of Exchange Compensation Allowances. The pay of the Administrative grades in the 1908 scheme are identical with the revised scale of pay for these grades that was introduced in 1905. In Government of India Resolution No. 471 E., dated the 30th April 1906, Exchange Compensation Allowance in the administrative grades was withdrawn from all officers appointed to the Department in and after the year 1907, while Government of India Resolution No. 675-694 E., dated the 24th April 1908, states, "No change is made in the pay of officers of administrative rank, as sanctioned in Resolution No. 1101 E., dated the 25th August, 1905, but Exchange Compensation Allowance will not be admissible on promotion to that rank of officers who, on the 8th March 1908, were below the rank of Executive Engineer, 1st grade. As promotion to Executive Engineer, 1st grade, required at least 19 years' service under the old time scale, this is equivalent to withdrawing Exchange Compensation Allowance in the Administrative grades from all officers appointed to the Department after 1888, without the withdrawal being compensated by any increase in the pay of these grades.

Therefore so far as officers who joined the Department between 1889 and 1907 are concerned, the pay and allowances of all the administrative grades was actually reduced by 6¼ per cent. by the re-organization scheme of 1908.

The policy of gradually eliminating Exchange Compensation Allowance has much to recommend it, but at the same time it is strongly urged that the withdrawal of this allowance should have been arranged so as not to cause any actual reduction in the pay and allowances of these appointments.

It is recommended that in view of the discontinuance of Exchange Compensation Allowance the pay of the administrative grade should be revised to the following amounts:—

Superintending Engineer, 3rd grade, Rs. 1,600 per mensem.

Superintending Engineer, 2nd grade, Rs. 1,900 per mensem.

Superintending Engineer, 1st grade, Rs. 2,200 per mensem.

The duties of first and second grade Chief Engineers are generally identical, and there should, therefore, be only one grade of Chief Engineer on Rs. 3,000 per mensem. The Local Allowances attached to the posts of Secretary to Local Governments under Government of India Resolution No. 1101 E., dated the 25th August, 1905, might then be withdrawn.

The principle is already laid down in paragraph 80, Volume I, Public Works Department Code, that promotion to the Administrative ranks should be by a strict system of selection as opposed to that of seniority and it is recommended that this principle be even more closely followed than it is at present.

72,064. **(V.) Conditions of Leave.**—The leave rules applicable to officers of the Public Works Department appointed by the Secretary of State are practically identical with those which apply to members of the Indian Civil Service and Military Officers subject to the Civil Leave rules; but this equality does not extend to maximum and minimum leave allowances. In the case of officers of the Indian Civil Service and Military Officers subject to the Civil Leave rules, furlough allowances are subject to a minimum limit of £500 per annum, or the salary last drawn whichever is less and a maximum limit of £1,000 per annum, whereas for Officers of the Public Works Department there is no minimum limit for furlough allowances (except that in the case of furlough on Medical Certificate or on account of ill health there is a minimum limit of £200 a year (under Civil Service Regulations, Article 320) and the maximum furlough allowance is limited to £800 per annum. Under the present rules the amount of furlough pay for an Imperial Officer of the Public Works Department is accordingly limited as follows:—

Years of completed Service.	Maximum furlough pay per annum.
	£
8	254
9	297
10	316⅔
11	337½
12	360
13	382½
14	405
15	427½
16	450
17	472½
18	495
19	517½
20	540
21	555
22	562½
3 years as Superintending Engineer, 3rd grade.	675
3 years as Superintending Engineer, 2nd grade.	787½
3 years as Superintending Engineer, 1st grade.	900*

The furlough pay is at present so low that married officers frequently cannot afford to take the furlough

* Subject to the present maximum limit of £800 per annum.

due to them, although it would generally be to the interest of Government that they should take such leave at fairly frequent intervals. This is covered by the last paragraph of the memorials recently submitted praying for improved Pension and leave allowances and which it is understood have been referred to this Royal Commission, *viz.*—"Thirdly that the leave allowances sanctioned for officers of the Indian Civil Service and Military Officers subject to the Civil Leave Rules may be extended to your petitioners' Service."

There does not appear to be any valid reason why all Imperial Officers in the Public Works Department should receive less favourable leave allowances than those granted to Military Officers serving in the Public Works Department, Police and other Departments. A minimum of £400 per annum or the pay last drawn whichever is less, is the lowest figure at which the minimum furlough allowance for the Imperial Service of the Public Works Department should be fixed in order to remedy the present conditions under which many officers are either unable to take the furlough which they have earned or else run into debt by doing so.

The maximum limit of £800 per annum only comes under operation for senior first grade Superintending Engineers and the cost of increasing this limit to £1,000 would entail very little extra expense and would place these senior Administrative Officers on the same footing as Indian Civilian and Military Officers of similar rank.

The many vexatious restrictions now in force regarding the grant of leave should be removed and the amount of leave due to an officer should be the total amount earned less the amount already taken.

Some proposals to this effect are at present being considered by the Government of India but they do not extend to Privilege Leave. At present the Privilege Leave earned is one-eleventh of the active service subject to the restriction that no further privilege leave can be earned while there is three months such leave due. This restriction should be removed entirely as also the rule that not more than three months' privilege leave can be taken at one time. If all these restrictions were removed the rules would be as follows:—

(i) The amount of privilege leave earned is one-eleventh of the total period spent on active service.

(ii) The amount of privilege due is the total amount earned less the total amount already taken.

(iii) The amount of furlough earned is one-fourth of the total period spent on active service or privilege leave.

(iv) The amount of furlough due is the total amount earned less the total amount already taken.

(v) Subject to the maximum limit of two years, leave due can be combined and taken to any extent at any time that an Officer can be spared provided that not more than 20 per cent. of the total Cadre can be absent on ordinary furlough at the same time.

The proposal at present under consideration to commute part of the furlough earned into half the amount of leave on full pay would be a valuable concession to those Officers who cannot at present afford to take more than a fraction of the furlough due to them, but the alterations and concessions already suggested would considerably reduce the demand for this new form of leave.

Study leave should be admissible for Officers of the Public Works Department on the same lines as the study leave now given to the Indian Medical Service. Engineering is a high scientific profession and it would be to the interests of Government to offer such special facilities to Public Works Officers to enable them to study the latest developments and most up-to-date methods of European practice.

In order to place officers serving in all parts of the Province on a more equal footing as regards leave and to admit of subsidiary leave being abolished, an Officer returning from furlough should be on duty again as soon as he reports himself at the Rangoon Secretariat. He will then be entitled to joining time on full pay and travelling allowances under the ordinary rules to whatever station he may be posted to.

72,065. **(VI.) Conditions of Pension.**—During the last 25 years the pay of the Department has been improved from time to time to meet the altered conditions of the value of the rupee and the cost of living; but although the cost of living in England has also greatly increased the pensions are still subject to limits that were fixed in 1884. The maximum limit of Rs. 5,000 still in force was fixed in 1864 when the sterling equivalent was £500. As pensions are now payable at 1*s.* 9*d.* the maximum pension of Rs. 5,000 is only worth £437 10*s.* per annum. The maximum possible pensions for officers joining the service after 1898 have been still further reduced by the withdrawal of the extra pension of Rs. 2,000 for three years' service as Chief Engineer and the limiting of the extra pension of Rs. 1,000 to three years' service as Superintending Engineer, first grade, or Chief Engineer, while it was formerly open to all grades of Superintending Engineer; and for officers entering the service after 1909 the additional pension is subject to the further condition of 28 years' total qualifying service. In the case of the Forest Department an additional pension of Rs. 1,000 per annum can be earned by three years' service as Conservator without and restriction as to grade.

It is hardly surprising therefore that the Officers in the Department are very dissatisfied with the present inadequate pension and that memorials on this subject have been submitted to the Government.

The scale of pension laid down in Article 641 of the Civil Service Regulations is quite liberal but the scale is rendered entirely inoperative by the low maximum limits that are fixed and which are in many cases even considerably lower than the maximum limts fixed by Civil Service Regulations, Article 474, which applies to Officers in the Provincial Service and others subject to the Indian Service Rules.

The following examples are sufficient to prove this:—

Years of completed Service.	Civil Service Regulations, Article 641.		Civil Service Regulations, Article 474.	
	Scale of Pension, amount.	Maximum limit.	Scale of Pension, amount.	Maximum limit.
(Imperial Service at present scale of pay.)	Rs.	Rs.	Rs.	Rs.
10	2,813	1,000	1,406	2,000
12	3,570	1,800	1,920	2,400
16	5,200	3,000	3,200	3,200
19	6,670	3,000	4,370	3,800
24	7,500 or over	4,000	6,000 or over	4,800
25 to 30	7,500 to 16,500	5,000 —	7,500 to 16,500	5,000 —

Retiring pensions should be granted in sterling at the rates suggested in the latest memorials on the subject, *viz.*:—

Ordinary Pensions.

On completing—	£
20 years' service	350
21 years' service	380
22 years' service	410
23 years' service	440
24 years' service	470
25 years' service	500
26 years' service	540
27 years' service	580
28 years' service	620
29 years' service	660
30 years' service	700

Special Service Pensions.

Secondly, that as in accordance with the orders of the Government of India Officers are appointed to the administrative grades entirely by merit, an additional special service pension of £40 per year of completed service be accorded to Officers in those grades, subject to a maximum total pension of £940 per annum.

Any period spent on practical training in England should count as service for pension up to the limit of

one year. The amount of furlough counted as qualifying service for pension should be as follows:—

Not less than—

15 years' total service, 1 year
20 years' total service, 2 years
25 years' total service, 3½ years
30 years' total service, 5 years

} Furlough to count as service for pension.

Invalid Pensions.—No proposals regarding invalid pensions are made in the memorials submitted from this Province. The following scale of Invalid Pensions should be adopted:

Years of Completed Service.	Scale of Pension as per Civil Service Regulations, Article 641. (Proportion of average emoluments.)	Maximum limit as per Civil Service Regulations, Article 474.
		Rs.
10	20-60ths	2,000 a year.
11	21-60ths	2,200 a year.
12	22-60ths	2,400 a year.
13	23-60ths	2,600 a year.
14	24-60ths	2,800 a year.
15	25-60ths	3,000 a year.
16	26 60ths	3,200 a year.
17	27-60ths	3,400 a year.
18	28-60ths	3,600 a year.
19	29-60ths	3,800 a year.

These pensions being paid in sterling rates at 2*s.* to the rupee as asked for in connection with retiring pensions.

72,066. **(VII.) Such limitations as may exist in the Employment of Non-Europeans and the working of the existing system of division of Service into Imperial and Provincial.**—At present the recruitment of Natives of India in England to the Imperial Service of the Public Works Department is understood to be limited to 10 per cent. of the appointments. The time for the increase of this percentage has not yet arrived.

Natives of India do not as a rule possess that personality and strength of character combined with adaptability and ability to take responsibility which is as necessary in the Imperial Service of the Public Works Department as in any other branch of the Public Service. Mere ability to pass examinations is not the only qualification required in recruits for the superior service of the largest spending department of the Government of India.

The Provincial Service.—As regards the Provincial Service it is understood that this service is primarily intended for Natives of India educated in India whose cost of education and subsequent cost of living and general expenses are considerably less than those of an Imperial Officer domiciled in England. There appear to be good reasons for such officers receiving a lower rate of pay than officers appointed in England and the Provincial Service should be continued in practically its present form.

It has been found impossible in practice to keep separate "listed posts," for officers of the Provincial Service and consequently Provincial Engineers are often placed in charges previously or subsequently held by Imperial Officers. The Provincial Service asserts that officers doing the same work should receive the same rate of pay but the same argument might be applied also in the Imperial Service when an Executive Engineer on Rs. 800 has to take charge of a Division formerly held by an officer drawing Rs. 1,250 per mensem! Although Provincial and Imperial Officers do in practice often hold the same charge at different times it does not necessarily follow that the duties are as efficiently discharged by the Provincial Officer as by the Imperial Officer and it is maintained that as a general rule the services of the Imperial Officer are of greater value to Government.

72,067. **(VIII.) Relations of the Service with the Indian Civil Service and other Services.**—The relations of the Public Works Department with other Departments are at present satisfactory and no change in this respect appears necessary. It is very desirable that the existing independence of the Department should be maintained.

It may be remarked, however, that there is a strong feeling among Executive Officers that the recent amalgamation of the Public Works Accounts Department with the Civil Accounts Department has resulted in a considerable increase of the office work of an Executive Engineer without any corresponding gain in the efficiency of the audit.

The new procedure has not yet passed beyond the transitory stages and it is hoped that means may still be found to reduce rather than increase the time which an Executive Engineer has to devote to accounts work; as all time so spent reduces that left available for the even more important duty of frequent inspection of works, which is the only real safeguard against extravagant and unproductive expenditure.

72,068. **(IX.) Any other points within the Terms of Reference to the Royal Commission not covered by the preceding Heads.**—*Temporary Engineers.*—It may be necessary to resort to the appointment of temporary Engineers, in order to provide for a temporary increase in establishment required for the construction of large new works or other special causes but such temporary Engineers should not be looked upon as a source of recruitment for the permanent service. The appointment of temporary Engineers to the permanent service any where above the bottom of th list appreciably affects the prospects of the officers below them on the list who were recruited in the ordinary way and thus causes discontent.

Burma Allowance.—The recommendation of the Special Committee appointed in 1910 to report on the subject of Burma Allowance should be given effect to. The report referred to proves that the present Burma Allowance is not sufficient to meet the extra cost of living in Burma as compared with India and that Burma Allowance should be paid to all grades of the service.

The old rule (Note 2 (*b*) of Appendix 19, Public Works Department Code) that the aggregate of salary plus the local allowance of Rs. 100 shall not in future exceed Rs. 1,100 was made about 1887 when the pay of a 1st grade Executive Engineer was Rs. 950 and it was apparently intended that the allowance was to be admissible to all Assistant and Executive Engineers but not to officers holding higher rank and therefore the limit should have been increased when the maximum pay of an Executive Engineer was increased to Rs. 1,250 in 1908. In the Forest Department, who are on an identical incremental scale, Burma Allowance is given to all officers below the rank of Conservator. This means that the maximum pay and allowance of a Deputy Conservator of Forests serving in Burma is Rs. 1,250 + 100 = Rs. 1,350 while that of an Executive Engineer is Rs. 1,250 only.

Pending the decision on the general question of Burma Allowances the present allowance should be given to all Assistant and Executive Engineers and the rules should be altered to give effect to this with retrospective effect from 1st April, 1908, the date on which the incremental scale of pay came into force.

This particular grievance of the Senior Executive Engineers was represented to the Government of India in 1908 but no decision in the matter has yet been arrived at. In the mean time an Executive Engineer receives only Rs. 50 Burma Allowance in his sixteenth year of service and then ceases to draw any allowance at all, while officers of the Forest Department in Burma continue to draw the allowance until they are promoted to the rank of Conservator.

House rent and House allowances.—Subdivisional Officers in the Public Works Department stationed elsewhere than at the Headquarters of the Division should receive rent free quarters in the same way as Subdivisional Officers of the Indian Civil Service and Civil Police. The Rangoon House Allowance Scheme is at present restricted to married men, and batchelors receive no compensation for the high house rents in Rangoon. The scheme should be extended so as to include batchelors and married men whose families are not in Rangoon, the allowance admissible being limited to the amount by which the house rent actually paid by them exceeds 10 per cent. of their pay.

Travelling Allowances on Transfer.—The Travelling Allowance admissible under the present rules is quite inadequate in cases of transfer and it is generally recognized that a transfer involves considerable loss to the officer concerned in almost every case. A transfer thus comes to be looked upon as a punishment involving a fine of greater or less amount according to the circumstances of the case. The necessity for special liberal rules to regulate the travelling allowances of gazetted officers transferred in the interests of the public service was brought to the notice of the Government of India in 1906 by the Government of Bengal but the matter appears to be still under consideration. The proposals made by the Government of Bengal in 1906 should be adopted and incorporated in the Civil Service Regulations.

Family Pension Fund.—It is very advisable that there should be some form of Family Pension Fund for the Public Works Department and such a fund on the lines of the Indian Civil Service Family Pension Fund or the Indian Army Family Pension Fund should be introduced. Probably several other Departments such as the Forest, Telegraph and Police, could be included in the same Family Pension Fund Scheme.

General Provident Fund.—This fund should be made more elastic as regards the amount that can be deposited, there does not seem to be any particular reason why the amount that can be subscribed to this fund should be limited to 12½ per cent. of the salary of an officer, or why the percentage which an officer subscribes should not be allowed to be altered from time to time in accordance with the wishes of the subscriber.

Examination in Burmese.—At present Public Works Department Officers have to pass the examination which is primarily set for officers of the Civil Service and Police Departments and no attention is paid to the special requirements of the Public Works Department. To remedy this officers of the Public Works Department appearing for an examination in Burmese should be given a special paper set by an officer of the Department.

Mr. L. W. Lewis called and examined.

72,069. (*Chairman.*) The witness said he was a member of the Imperial branch of the Public Works Department, Burma, and represented the whole of the officers of that branch. The written statement embodied the general feeling of the service.

72,070. He considered the present system of recruitment should be continued, and emphasised the necessity of nomination in order to secure qualities that possibly would not be obtained by open competition. An examination was not very necessary if people had the proper qualifications and were carefully selected. Candidates should have an Honour Degree. The best age for recruitment was twenty-three to twenty-four, but no harm would be done by raising the age limit. A man a little older than twenty-four would still be young enough to assimilate Indian conditions and would come out with a more developed character.

72,071. The officers he represented believed the best field for training was in India, but his personal opinion was that a year in England would be preferable. The year he had spent on works in England after leaving Cooper's Hill was of enormaus value to him. It was important that a recruit should make himself acquainted with Indian conditions, language, and so on, but he did not favour a probationary period in India, as possibly men would not be obtained if they had to undergo a probation in the country.

72,072. From the point of view of the efficiency of the service it would be better to reject an unsuitable man at the earliest possible date, but that might bring the service into disrepute with the colleges in England and might be detrimental to recruitment, because men would not come out with the possibility of being sent back as failures. A possible alternative to probation would be to engage men temporarily on a five years' agreement. It was the general procedure in the engineering profession for men to leave England on term agreements, and if they were satisfactory and their services were still required the agreement was generally extended.

72,073. In Burma there were no officers in the Provincial Service who had reached the top of the list of executive engineers, so that he was not in a position to say whether officers had failed in due course to get promotion to the rank of Superintending Engineer.

72,074. The recommendation in the written statement that no Chief Engineer should be allowed to retain the same appointment for more than five years was based on the rule in the code. A Chief Engineer had to retire at the age of fifty-five and it sometimes happened that he only had a year or a year and a half as Chief Engineer. It was very seldom that officers attained to that rank before the age of fifty.

72,075. The suggestion that after an executive engineer reached Rs. 1,250 he should continue to draw further increments of Rs. 50 up to a maximum of Rs. 1,400 after twenty-five years' service was put forward as a kind of solatium for non-promotion. In the old days when a man had been executive engineer for five years on the same pay he was given an increase, and a further increase after the next five years. The system was designed to compensate for blocks in promotion. It was really a personal allowance over and above the pay he was qualified to receive for the work he was discharging and was only given to men who although qualified for promotion to Superintending Engineers, were unable to obtain promotion.

72,076. Under present conditions officers were frequently unable to take privilege leave or furlough when they had earned it. There was a good deal of difficulty in obtaining privilege leave owing to the smallness of the cadre and the pressure of work; and officers could not afford to take furlough, especially married officers who had their families in England. The furlough pay after eight years was regarded as insufficient. Study leave should be granted under rules similar to those of the Indian Medical Service. At present officers were not taking study leave to any extent. If a man desired to study any particular question he had to be placed on deputation, but regulations should be introduced with the specific object of affording officers opportunity for study and bringing themselves up to date.

72,077. There were a great many officers who intended to take advantage of the twenty years' rule for retirement and some had already done so. From the point of view of the Public Service, possibly twenty years was too short a period of service to qualify for optional retirement, but if a man could obtain work in England it was to his benefit in many cases to retire after twenty years. The officers would like to retain the twenty years rule even though an improvement in pension was granted. The rule was a great inducement to men to join the department.

72,078. (*Sir Murray Hammick.*) With regard to bringing men out on terminal agreements, the fact that the best men were kept on in the service would not mean that the others were discharged with any reflection on their capacity. The men would be brought out for a large programme of work and when the work was completed they would not be required any further. It would mean bringing out many more men than could possibly be kept on the service.

72,079. (*Sir Valentine Chirol.*) If the system of terminal contracts was adopted there might be a considerable reduction in the permanent establishment of the department. In Burma there were not nearly enough men to do the general work; the divisions were much too large and the men had more work given to them than they could look after with efficiency. The department suffered greatly from the want of Assistant Engineers and that could be remedied by a system of terminal contracts. He had not, however, considered the economic aspect of the question. It would be probably necessary to offer the contract men slightly higher pay than that offered

to junior members of the Public Works Department and also fairly good terms in the way of a provident fund. It was possible that some who came out on contract would establish themselves in the country as engineers, if they found an opening.

72,080. (*Mr. Abdur Rahim.*) There was one case of a man who had been thirty years in the service and had only taken three and a half months' privilege leave. He had no figures to show how many men did not take privilege leave or furlough.

72,081. He differed from his colleagues on the subject of training, believing that training in England was of very great use, even for irrigation work. The work he himself had done on railways in England had given him a general idea of how things should be done on irrigation construction when he had to do that work in Burma. For the work of maintenance and running of canals experience in England was practically valueless, but it was of great use for constructional work.

72,082. He had not thought out any programme for study leave. He did not know the rules under which Indian Medical Service officers obtained study leave but believed they were allowed to take a course in a certain branch of work and had to give proof that the time was adequately utilised.

72,083. When a large number of men were required on terminal contracts they would be engaged for the work in hand at the time, and he thought the system would result in economy.

72,084. (*Mr. Madge.*) A thorough professional training would enable a man to adapt himself to engineering work anywhere. The system of terminal contracts would not be in substitution for the departmental service, but would be auxiliary thereto. There were certain drawbacks in a uniform system; it was necessary to recruit so far ahead that the recruitment was carried on without regard to any programme of work. He did not think in Burma it would be advisable to give out work to contractors instead of having it done by the Public Works Department. It would be better in Burma for the Department to carry out work with petty contractors rather than with one big contractor.

72,085. He did not think men would be willing to have their furlough curtailed if they received six months' privilege leave on full pay, but no doubt officers would agree to take half their furlough on full pay.

72,086. As a rule the imported engineer in Burma was better than the indigenous man. Some temporary engineers had been employed in Burma for a short time but there were only two there now. They were taken on from month to month when there was a rush of work, and then their services were dispensed with.

72,087. (*Mr. Fisher.*) The present system of recruitment was satisfactory but did not give so good a type of officer as was obtained from Cooper's Hill. An idea of the work done by the Public Works Department in Burma could be obtained from the administrative reports.

72,088. (*Mr. Sly.*) The Provincial Service officers in Burma came from Rurki, and he knew of no Burman now living who had been appointed from Sibpur.

72,089. He doubted whether enough Indians could be obtained to make the system of short term contracts available for recruits in India, but he had not thoroughly considered the matter from this point of view. His recommendation was limited to recruits from England. The term of the contract might be three of five years, dependent on the programme of work. Recruitment for the department would go on as at present, the temporary recruitment being intended merely to relieve pressure. Rather than have a system of probation in this country he would prefer that engineers recruited in England should come out on a contract term and on the expiration of that term a proportion should be appointed permanently to the department; but apart from probation his preference was for the present system supplemented by engineers on temporary contracts for definite work. It would not be advisable to bring out men on ten year contracts and select executive engineers from men whose contracts were just expiring.

72,090. In Rangoon it would be possible to abolish the small contract system for large works and employ large firms but that would not mean a reduction of the staff of the department. There was a large amount of petty work in Rangoon which large contractors would not take up, and the department would have to be maintained even though particular works were given out to contractors.

72,091. The leave rules of the department were exactly the same as those of other services, except with regard to pay. The proposition that furlough should end when an officer reported at the Rangoon Secretariat was made in order to equalise matters. A man who had to take over a charge of an out-of-the-way-place was on half pay until he reached his charge, while the man who came to Rangoon went on full pay at once. The same disability existed in other Provinces in India and he suggested that they should adopt the same remedy. The concession was not meant to apply to privilege leave, and was made with the idea of doing away with subsidiary leave.

72,092. (*Mr. Chaubal.*) He would rather have the present system of nomination than a system of open competition.

72,093. The observation in the written statement that the time had not arrived for an increase on the 10 per cent. proportion of Indians was the result of experience. As a rule Indians were not a great success in that country. The statement was not based on statistics but on general experience. At present there was only one native of India recruited in Europe in the department. He did not think that the argument put forward by the Provincial service for abolishing the difference in salaries, between the officers of that service and the Imperial service officers on the ground that they were doing identically the same work was analogous to the argument put forward in the written statement to the effect that the duties of first and second grade Chief Engineers were generally identical and there should therefore be only one grade of Rs. 3.000 per month.

72,094. (*Sir Theodore Morison.*) With regard to reducing the Public Works Department to a small nucleus of supervising officers and giving out the work to engineering firms, it might be that the construction of a long line of Railway would be a suitable work to give to large contractors, but the general work of the department could not be done in that way. Repairs and general work would always have to be done by petty contractors as at present. He doubted whether it would be any cheaper to employ a large contractor on big works, and a large firm would employ petty contractors exactly as the department did at present. It might possibly be that in time large firms would be established in India who would be able to undertake large contracts. In Burma a very large engineering firm was given some extensive work to do but everybody in the department came to the conclusion that the department could have done it quicker and better itself. There were building contractors now established who would be able to take over a large amount of building work, but the Public Works Department would have to prepare specifications, supply clerks of works, and supervise the whole of the work. The measuring up would undoubtedly have to be done by an engineer as it was necessary to employ a sub-divisional officer in that capacity. It was true a very highly trained engineer was not required for measuring work, but it was necessary to have a man with some qualifications and a good deal of honesty.

72,095. (*Lord Ronaldshay.*) At present in the department there were forty-one executive engineers and forty-two assistant engineers. All divisions had not an assistant engineer in charge of a sub-division. In the irrigation circle a larger proportion of assistant engineers were employed than in other circles. There was a certain number of districts in which the sub-divisions were not held by assistant engineers. The sub-divisional charges not only absorbed the whole of the assistant engineers but a large part of the upper subordinate service and part of the lower subordinate service. At times temporary engineers had been placed in sub-divisional charges and there were a few

in such charges now. It was not an ideal state of affairs to have a subordinate officer in sub-divisional charges, but it was the best that could be done at present. It would be a great improvement on the present system to employ a large number of assistant engineers on terminal contracts for the purpose of placing them in sub-divisions; but it would probably be too expensive.

(The witness withdrew.)

J. Craig, Esq., Executive Engineer, Burma.

Written Statement relating to the Public Works Department, being the corporate opinion of Officers of the Provincial Engineer Service, Burma.*

72,096. (1.) The question of the recruitment of the Engineer Establishment of the Public Works Department is one that has given rise to widespread and lasting discontent. It is generally felt throughout the country that the policy of extending the alumni of the Indian Engineering Colleges from the Imperial Service (*in which they were formerly included*) is unjust and should be abandoned.

(2.) The following points which deal with this question deserve consideration, for they reveal that the situation has not in fact been adequately appreciated.

ORIGIN OF THE PROVINCIAL ENGINEER SERVICE.

(3.) Prior to the institution of the Provincial Engineer Service by the Government of India, Resolution No. 2112 G., dated the 19th July, 1892, recruits from the Indian Engineering Colleges (one of which, viz., that at Rurki, was established so long ago as 1847) were appointed to the Imperial Service, *i.e*, on an equal footing with Engineers obtained from England. It has been repeatedly proclaimed (*vide* the Government of India, Resolution No. 2112 G., mentioned above, and No. 675-694 E., dated the 24th April, 1908, &c.) that the Provincial Engineer Service was the outcome of the recommendations of the Public Service Commission of 1886-87. The issues which naturally present themselves are—

(i) Were these recommendations sound in themselves?

(ii) Was it justifiable to give effect to them?

(iii) Has the policy advocated by the Commission been consistently followed?

The following considerations show that the answer to each of these questions is in the negative and that therefore the institution and retention of the Provincial Engineer Service stands self-condemned.

PUBLIC SERVICE COMMISSION OF 1886-87.

(4.) The report of that body states that its recommendations were based on two grounds, viz.:—

(i) That the considerations which led it to recommend the formation of Imperial and Provincial Services, in respect to the various branches of the Civil Service, with distinct conditions of service, applied with equal force to the Engineer Establishment of the Public Works Department, and

(ii) That Engineers recruited from England received a better professional training than that which the Indian Colleges were capable of affording.

(5.) *Ground No.* (i). — Here the Commission were distinctly in error because there was absolutely no analogy (and this fact has been admitted) between the case of the various branches of the Civil Service and that of the Engineer Establishment of the Public Works Department.

The following statement contrasts the facts of the case of the various former branches of the Civil Service recruited in India with those of the case of Indian trained Engineers:—

Case of the various branches of the Civil Service.	*Case of Indian trained Engineers.*
(i) There had always been a complete distinction between the various branches of the Civil Service recruited in England and India.	This was not the case with the Engineer Establishment of the Public Works Department. Engineers recruited in England and India were on precisely the same footing.
(ii) The branches of the Civil Service recruited in India (now included in the Provincial Service) were formerly subordinate services and were not recruited for and required to do the same work and bear the same responsibilities as Officers of the Imperial Civil Service obtained from England. The same remarks apply to most other Provincial Services, *e.g.*, the Survey, Forests, &c.	Engineers recruited in India belonged to a superior service. They were and are still recruited for and required to do the same work and bear the same responsibilities as their English contemporaries.
(iii) The Commission recognized that the Branches of the Civil Service recruited in India were recruited in an irregular manner which was not conducive to efficiency. The Provincial Service was designed to regularize recruitment and did in fact considerably raise the status and improve the prospects of these services.	Indian trained Engineers were recruited from specially established institutions of long standing, one of which had been in existence for forty years. Many of them had attained high administrative appointments. The Provincial Service was in the case of these Indian Engineering Colleges a retrograde measure and greatly lowered the status and prospects offered to their successful students.

Furthermore it was virtually admitted by the Government when actually giving effect to the Commission's recommendations that there was no analogy between the case of Indian trained Engineers and those other services recruited in India; for the Provincial Engineer Service, as instituted, was quite dissimilar to other Provincial Services. In short, except as regards pay, leave, and pension, there was in all other respects no distinction between Engineers recruited in England and India respectively (*vide* Resolution No. 2112 G., dated the 19th July, 1892).

(6.) *Ground No.* (ii).—This conclusion obviously could only have been arrived at from the evidence before the Commission which, be it mentioned, was not tested by cross-examination of the witnesses produced.

A close scrutiny of the evidence will reveal—

(i) That it did not establish the inferiority of Indian trained Engineers, for many witnesses, including officers with the widest experience, were of opinion that there was little to choose between the best Rurki Engineer and his English rival, and

(ii) That much of it was prejudiced for, speaking generally, the excellent records established by many Indian trained Engineers in the past were forgotten, the fact that *natives* of India had only recently begun to appreciate and practise engineering as a profession was not considered, and the fact that many Indian College Engineers were at that time holding high administrative appointments secured by competition with their English contemporaries was completely ignored.

(7.) Even admitting for the moment, that the evidence tended to prove that the Indian Engineering Institutions (which had done well enough in the past) had fallen short of the requirements of the day, the proper remedy lay in raising the standard of professional education imparted in them and not, as advocated, in making a differentiation between recruits from them and Engineers obtained from England.

* The statement was signed by Messrs. W. R. Wells and J. Craig, Executive Engineers, and Mr. A. H. Ricketts, Assistant Engineer.

(8.) Again it is a very significant fact that the Commission did not advocate the creation of any such distinction in the cases of the remaining superior services (*e.g.*, the Accounts, Traffic, Finance, &c.), which were also partially recruited in India, but in which recruitment was by nomination and not by competition open to all.

(9.) It is contended, therefore, that the Commission failed to appreciate the true position in connection with the Engineer Establishment of the Public Works Department recruited in India, and that their recommendations which suggested as an awkward and glaringly unjust method of remedying an alleged evil (*viz.*, the inferiority of Indian trained Engineers) were wholly unsound.

(10.) To pass on the second issue, *viz.*, whether it was justifiable to give effect to the Commission's recommendations. The answer is most emphatically in the negative for two reasons.

(11.) Reason (i)—*The Government of India Act of* 1833 *and the Queen's Proclamation of* 1858.—By Clause 87 of the said Act it is provided that "no person by reason of his *birth, creed or colour* shall be disqualified from holding *any* office in our service." In the despatch of the Board of Directors of the Honourable East India Company which accompanied the Act, it was stated:—"It is fitting that this important enactment should be understood in order that its full *spirit* and intention may be transfused through our whole system of administration. You will observe that its object is not to ascertain qualification but to remove disqualification . . . . . Fitness is henceforth to be the criterion of eligibility." Again the Queen's Proclamation, which is widely known and which it is therefore unnecessary to quote, was couched in very similar terms.

The above statute and proclamation have been widely regarded as a charter removing all bars to any branch of the public service and holding out the promise of increased and higher employments of Natives of India (which term includes statutory natives) and the complaint that this promise has not been fulfilled has been widespread and uninterrupted.

When the case of the Indian Engineering Colleges is examined, however, the position becomes worse, because here, by the creation of the Provincial Engineer Service, the public in India entering these institutions were in fact dispossessed of that which they had had for nearly half a century.

Whatever may be the construction put on the said Act of 1833, and the Royal Proclamation as to the grant of facilities for admission to the Public Service not already enjoyed, it is contended that these pronouncements at any rate barred the institution of the Provincial Engineer Service and the withdrawal from the alumni of Indian Colleges of that which they had possessed for a long period of time, *viz.*, full equality with their contemporaries from England. The introduction of the Provincial Engineer Service reversed the practice of years, thereby disturbing vested rights which had accrued to the public in India, and suddenly established a system by which the place of recruitment alone is the criterion of eligibility for the Imperial Branch of the Public Works Department.

It may be argued that the Indian Engineering Colleges were disqualified from receiving appointments in the Imperial Service by reason of the finding of the Public Service Commission that recruits trained in them were inferior to Engineers obtained from England. In reply it is contended that—

(*a*) the findings of the Commission, as argued in sub-paragraph 6 above, cannot be upheld;

(*b*) the Government of India have virtually acknowledged that Indian trained Engineers are qualified for the Imperial Service (*vide* the arguments connected with the case of Temporary Engineers, paragraph 13 below). If outclassed people from Rurki College, who in addition were only eligible for the Provincial Service are held to be fitted for the Imperial Service, the pick of the Indian Colleges cannot be defeated;

(*c*) even admitting its existence, this disqualification based upon the findings of the Public Service Commission was capable of being removed and should have been immediately removed; and

(*d*) in any case it has since been removed, *vide* the public admissions of eminent persons quoted in sub-paragraph 23 (*b*) below. The Indian Engineering Institutions should therefore be restored to the position they occupied before.

(12.) Reason (ii)—*Pledge given to Indian Colleges in* 1873.—Again the institution of the Provincial Service for Indian College Engineers was in direct opposition to a definite pledge given to them in a speech delivered by Sir William Muir, Lieutenant-Governor of North-Western Provinces at Rurki on the 28th November 1873, of which the following is an extract:—". . . . But apart from personal associations, there is a reason which renders the present moment one of public interest; the establishment in England of an Engineering College for India has unsettled the minds of the public here as to the prospects of this institution and the continuance to it of the patronage of Government. It has been a subject of much anxiety to myself and of correspondence with the Government of India. It is, therefore, with sincere satisfaction that I am able to announce to you and through you to those without who are interested in the Thomason College, that the Institution at Cooper's Hill *will in no degree affect the relations of the Government of India with this College, nor the employment which has been hitherto guaranteed* to its more successful students. Between the two seminaries there will be no opposition or antagonism. The requirements of this great country are ample for both. I am sure that you will all, with me, be thankful to the Governor-General in Council for the justice which has thus been rendered to Rurki College."

The pledge was given shortly after the institution of Cooper's Hill College at a time when the public in India were naturally apprehensive that the position of the alumni of the Indian Engineering Colleges in the Public Works Department would be injuriously affected, and it will be observed that it was given with the full authority of the Government of India and possibly also of the Secretary of State.

It will further be noticed that the Government pledged that the Institution of Cooper's Hill would in *no degree* affect its relations with Rurki College, nor the appointments "*hitherto guaranteed*" to its successful students. The appointments "hitherto guaranteed" were in the Imperial Service. Yet notwithstanding this pledge the Provincial Engineer Service making a great distinction between Engineers recruited in England and India was introduced twenty years later and was based to a great extent on a comparison of the respective merits of Cooper's Hill and Indian trained Engineers.

Again, it must be noted that this pledge, which is recorded in the Rurki College Calendar of 1872-73, formed one of the strongest inducements to candidates to enter Rurki College, for these men naturally believed (and it was a legitimate belief for them to nourish), that the distinction created was merely a tentative measure, and that when the organization of the Engineer Establishment came to be reconsidered, in accordance with paragraph 10 of the Resolution No. 2523-G. of 1893, the said distinction would be abolished.

(13.) *Case of certain Temporary Engineers.*—It now remains to examine whether the recommendations of the Commission have been consistently followed, and whether the subsequent actions of the Government indicate an unqualified approval and acceptance of those recommendations. Here again the answer is emphatically in the negative. The arguments in this connection refer to the case of twelve Temporary Engineers, all Rurki men, who, many years after the Provincial Engineer Service had been established by the Resolution No. 2112-G. of 1892, were made permanent and placed, not in the Provincial, but in the Imperial Service.

The question is why?

The deep significance of this will be more readily and forcibly recognised when the following facts are digested:—

(i) These officers had, with one single exception, passed out of Rurki College after the Commission had discovered that this Institution did not afford a training equal to that obtained in England.

(ii) They had failed to secure guaranteed appointments when competing for them and had consequently no claim (except good service rendered, which applies equally to other Indian trained Engineers) to this special treatment.

(iii) The majority of them had failed to secure the necessary percentage of marks (*viz.*, 66 per cent.) required in order to qualify for Government appointments and were therefore not eligible under the rules of the Institution which trained them, for permanent appointments at all. *That is to say they could not, with the percentage of marks obtained by them, have obtained guaranteed appointments even if they had in fact headed the examination lists in their respective years.*

(iv) Three of these Officers, *viz.*, Messrs. W. C. Cooper, C. H. A. Muller and E. S. Christie, *were specially barred from being appointed to the Imperial Service* under paragraph 11 of the Resolution No. 2112-G. of 1892, because they were actually undergoing training at Rurki College on the date of the said Resolution and failed to secure the guarateed appointments allotted by Resolution No. 1443-G. of 1884. In their case therefore the Provincial Engineer Service took effect from the 19th July, 1892. That is to say, even ignoring the disqualification stated in (ii) above, they were only eligible for the Provincial Service.

(v) In one case (the name can be stated if required) the Officer failed to qualify absolutely in Rurki College and took up an appointment in the service of the State as a Temporary Sub-Overseer in the Rajputana-Malwa Railway. He was subsequently engaged in a subordinate capacity as Temporary Sub-Engineer in the Punjab and later appointed as a Temporary Engineer, from whence he was translated to the Imperial Engineer Service. This is therefore a case where an unqualified person has risen from the lowest rung of the ladder to Imperial Service, long after the Provincial Engineer Service was established, and this should be contrasted with the treatment accorded to the pick of the Indian Colleges against whom the door to similar advancement is absolutely banged and barred.

(14.) It is irresistibly clear that—

(i) the placing of these Officers in the Imperial Service was a distinct departure from the policy advocated by the Public Service Commission and in fact amounts to a reversal of that policy.

(ii) It stands revealed that the Government have virtually admitted, that Engineers trained in India even subsequent to the Commission's findings, are not necessarily inferior to men recruited in England, and that they are fully qualified to be placed on an equality with the latter, *i.e.*, in the Imperial Service. If this applies to men who are out-classed in Rurki College it must likewise apply with greater force to others who, as stated above, are the pick of the Indian College, but who are placed in the Provincial Service.

(iii) The action taken in respect to the three Officers mentioned above whose appointment to the Imperial Service was barred by virtue of Resolution No. 2112-G. of 1892 must be held to have been due to an authorised relaxation of the rules laid down in the said Resolution and constitutes in fact an amendment of the said rules and renders other Indian trained Engineers also eligible for the Imperial Service, and it is further contended that justice and equity demand that these latter should be similarly treated.

(15.) *Other Superior Services, e.g., the Accounts, Finance, Traffic and Police (until recently)*—

The facts in connection with these Services are specially worthy of attention for they serve both to emphasise the injustice of the Provincial Service and dispel the erroneous belief "*that it is the general rule that members of the Public Service recruited in India are on a different footing as regards pay, leave and pension rules to Officers obtained from England.*"

This, be it noted, was the reason given by the Secretary of State for not re-opening the Imperial Service to Indian trained Engineers in the House of Commons in reply to a question asked by Mr. T. Hart Davies in May 1908, enquiring whether the subject of re-opening the Imperial Service to Indian College Engineers would be considered.

The service are, like the Public Works Department, partially recruited in India, but such Indian recruits are on a full equality with their English contemporaries and secure vastly better terms of service than those granted to the Alumni of the Indian Engineering Institutions.

The questions which immediately present themselves are—

(*a*) why were not Provincial Branches introduced for these services also? and

(*b*) why was the Indian recruited element of the Public Works Department alone singled out for degradation?

It is a fact that of all the Brancehs of the Public Service in which the Indian recruited and imported elements were on an equal footing, the Public Works Department only was disturbed and split up into Imperial and Provincial services.

It is contended that the introduction of this invidious and unjust distinction between British subjects born, domiciled, educated and recruited in India is indefensible. Further, in view of the fact that Indian trained Engineers win their appointments by free and open competition and not by nomination (which is frequently secured by influence) and that they can claim to possess superior educational qualifications to those required of men entering these other services, this state of affairs is significant and startling. For example, the educational test required for admission into the Accounts and Traffic Departments is on a par with that required *merely to enter* the Indian Engineering Colleges, while the Engineer has a further superior, general and professional educational course of three to four years in College itself, and also a further professional training of one year after completing his College course.

It is manifest therefore—

(*a*) that the above facts reveal that it is not the general rule that members of the public services recruited in India are on a different footing to officers of their services obtained from England, but

(*b*) that on the contrary, where officers recruited in both countries are recruited for and required to do the same work and have the same responsibilities, as in the case of the above-mentioned services, it is the general rule *that they are on the same footing;*

(*c*) that of all the branches of the public service in which Indian trained and English recruits were formerly on the same footing, the position of the Alumni of the Indian Engineering Colleges has alone been disturbed.

It is therefore contended that—

(i) *the ground, stated in reply to the question asked in the House of Commons,* for not re-opening the Imperial Service to Indian College Engineers disappears; and

(ii) that they should in consequence be restored to their former position.

POSITION OF INDIAN COLLEGE ENGINEERS CONTRASTED WITH THAT OF ENGINEERS FROM ENGLAND.

I.—Position prior to 1908.

(16.) The above arguments deal with the policy involved in the creation of the Provincial Engineer Service. It now remains to examine the conditions imposed upon the public seeking admission to the public service through the Indian Engineering Colleges and to contrast them with those offered to Engineers obtained from England.

Alhough both these classes were and are still *recruited for and required to do the same work and bear the same responsibilities,* the position occupied by the Alumni of Indian Colleges prior to 1908, was as follows:—

(i) The Indian College Engineer received in thirty years Rs. 1,16,530 (amounting at 4 per cent. compound interest to Rs. 1,76,800) less pay than his Imperial contemporary.

(ii) The pay of the Provincial Executive Engineer, 3rd Grade, in charge of a division, was actually much less than that granted to an Imperial Assistant Engineer, 1st Grade, in charge of a subdivision involving inferior work and far less responsibility. As

a result, instances frequently occurred in which Provincial Engineers received less pay than their own subordinates.

(iii) The position of Provincial Engineers on their attaining the administrative rank of Superintending Engineer was still more glaring. Promotions to these appointments are, under rule, made by special selection only, so that a Provincial Engineer so promoted would necessarily be selected in preference to other Executive Engineers whether Imperial or Provincial. Under the scale of pay fixed, a Provincial Engineer on receiving such promotion would not only have received approximately Rs. 67,000 less pay during his former service than other Imperial Officers, who by the very fact of his selection were confessedly inferior to him, but he would even then *qua* Superintending Engineer receive just half the pay of an Imperial Officer holding the same appointment and also less than Imperial Officers whom he had superseded and who would be his immediate subordinates.

(iv) In the matter of special allowances, which are given solely on account of extra expense involved in living in some localities, Provincial Engineers were and are still granted only two-thirds of the sum allowed to Imperial Officers.

In certain cases, moreover (*vide* Appendix 19, Public Works Code), the allowances granted to Provincial Officers from Superintending Engineer downwards are less than those granted to Sub-engineers (subordinates). These glaring and unjust anomalies speak for themselves. They handicapped the Indian College recruit in every possible way.

(17) A general memorial, setting forth these grievances and praying for the restoration of the Alumni of Indian Engineering Colleges to the Imperial Service, was accordingly submitted to the Viceroy in 1902, that is, when the Provincial Service had been in force seven years and when the consideration of the organisation of the Engineer Establishment of the Public Works Department was due, in accordance with paragraph 10 of the Resolution No. 2523-G., dated the 25th September 1893. The reply given was a direct refusal on the ground that the memorialists accepted employment well knowing "*the terms of the service.*" This reply may here be suitably contrasted with the attitude displayed towards the imported elements of the Public Works Department, who have met with no resistance in their demands to secure accelerated promotion and increased rate of pay which, be it known, is very greatly in excess of that which they contracted to receive, and who are at the present moment clamouring for largely improved pensions to which they are distinctly not entitled under "*the terms of their service.*"

(18) The matter has then appealed to the Secretary of State by means of a general memorial submitted in December 1906.

II.—Changes of 1908.

(19) The next thing that transpired was the memorable reorganisation scheme of 1908 (*vide* Resolution No. 675-694E., dated 24th April 1908), which made the position of the Alumni of the Indian Colleges worse. Indian College Engineers were also then informed that the orders of the Secretary of State on their memorial of 1906 were embodied in the said reorganisation scheme.

It would be no exaggeration to say that the feeling raised by this retrograde measure was one of utter consternation and despair, which deepened into bitter and intense resentment on the issue, shortly after, of the Government of India's letter No. 997-E., dated 6th June 1908, laying down the treatment to be accorded to Indian College Engineers, who declined to accept the new conditions of service.

Briefly, the changes introduced in 1908 were:—

(i) Provincial Engineers were removed from the same list as Imperial Officers, thus making a complete differentiation between the two classes.

(ii) The promotion of Imperial Officers was accelerated, while that of Provincial Engineers was retarded by several years, thus creating the position by which Indian College men would, through no fault of their own, and wholly irrespective of the true relative merit, be compelled to serve under Imperial men who were their juniors and who may have been previously their own subordinates.

(iii) Promotion to the administrative grade, *i.e.*, to Superintending Engineers and upwards, was made almost *physically* impossible for Indian College Engineers.

(iv) The whole reorganisation was transparently designed to subordinate the Indian recruited element of the Public Works Department to the element obtained from England, and to place the former in exactly the same relation to the latter as members of other Provincial services bear to the Imperial Officers of their services.

(v) As compensation for these changes which shattered their position and prospects and ensured the complete domination of the imported staff in the Public Works Department, a slight increase of pay was offered to Indian College Engineers. This increase when contrasted with the substantial increase granted to Imperial Officers is striking.

For example (i) in the first eight years of service the increase granted to Provincial Engineers averaged Rs. 3 per mensem, while that of Imperial Officers averaged Rs. 88 per mensem.

(ii) In the first fifteen years of service the average increase for Provincial Engineers was Rs. 29 per mensem, while that of Imperial Engineers averaged Rs. 142 per mensem.

And notwithstanding the fact (the point requires and will bear repetition) that *both classes of Officers are recruited for and required to do the same work and bear the same responsibilities.*

(20) It is small wonder that this reorganisation scheme was rejected by the vast majority of Indian College Engineers, but they were destined to receive an even greater and more staggering blow, for it was ruled (*vide* the Government of India's letter No. 997-E., dated the 6th June 1908, cited above) that—

(i) these officers would receive no increase of pay;

(ii) they would continue to be promoted according to the rules previously in force for Imperial and Provincial men alike and which had been abolished for the Imperial Service; and

(iii) their names would also be removed from the same list as their Imperial contemporaries.

These orders were not only unjust in that they withheld an increase of pay which had, only one month previously (*vide* preamble to Resolution No. 675-694-E., dated 24th April 1908), been publicly admitted to be necessary for the Engineer Establishment of the Public Works Department, but they were also in direct opposition to and constituted a withdrawal of the *primary conditions* under which these Officers were induced to accept employment, *vide* Resolution No. 2112-G. and No. 2523-G., dated the 19th July and 25th September 1893, respectively.

Under these said Resolutions Provincial Engineers entered the service on the express conditions:—

(i) that except as regards amount of pay, leave and pension there would in all other respects be no distinction between them and Imperial Officers; and

(ii) that they were to be borne on the same list and promoted side by side with Imperial Engineers.

It is submitted that this disregard of the paramount and indefeasible rights of these Officers and this arbitrary imposition of changed conditions which would not have been accepted in the first instance (*i.e.*, when they entered the service) is unparalleled, and constitutes a significant departure from the practice hitherto observed by which the inducements offered to men entering the public service have been regarded as permanent and enduring.

III.—Changes of 1912.

(21) The general and sustained agitation produced by the above treatment is well known. After prolonged reconsideration the Government of India were led to the conclusion that the position taken up in 1908 was untenable, and the reorganisation scheme of that year has in consequence been recently reversed, *vide* Resolution No. 439-458-E., dated the 15th May 1912.

The position now is exactly as it was previous to 1908 with similar anomalies and defects, viz.:—

(i) the minimum pay of Provincial Engineers is much less than the maximum pay of Imperial Assistant Engineers;

(ii) The minimum pay of Provincial Superintending Engineers is less than the maximum pay of Imperial Executive Engineers;

(iii) the same anomalies in connection with local allowance still exist; and

(iv) generally the pay granted to the provincial element is inadequte and is not commensurate with their work and responsibilities.

The redress granted, however, is accepted as partial and tentatife as it has been admitted in replies to questions asked in the House of Commons that the case has not been finally settled and that the question of the restoration of the Alumni of the Indian Engineering Colleges to the Imperial Service has been deferred for consideration by the Royal Commission.

RECAPITULATION.

(22) Various reasons have been advanced above, which it is contented, establish—

(1) that the policy advocated by the Public Service Commission of creating a Provincial Engineer Service for Indian recruits was unsound;

(2) that its adoption was barred by the Government of India Act of 1833 and the Royal Proclamation of 1858, for it in fact, dispossessed the Public in India of facilities for admission to the higher ranks of the public service on a complete equality with Officers obtained from England which they had enjoyed for nearly half a century. It must also be remembered that these Engineering Colleges formed the only source in India of recruitment to the public service on an equality with Officers from England, by free competition open to all.

(3) that the inclusion of the Alumni of the Indian Engineering Colleges in the Provincial Engineer Service constituted the breach of a definite pledge and has moreover resulted in the creation of an invidious and unjustifiable distinction between British subjects domiciled, educated and recruited in India as explained in sub-paragraph 15 above;

(4) That the Government themselves have repeatedly broken away from the policy advocated by the Commission as in the cases of the various temporary Engineers (*vide* sub-paragraphs 13 and 14 above);

(5) that the line of action taken in the cases of these Temporary Engineers gives other Indian College Engineers a just and an irristible claim to like treatment;

(6) that the whole history of the Provincial Engineer Service from its very institution reveals a course of long continued injustice and shows how very little consideration has in fact been bestowed upon it; and

(7) that the only solution of the matter lies in the discontinuance of the present policy and the restoration of the Alumni of the Indian Engineering Colleges to the position they formerly occupied, that is *to the Imperial Service.*

CONCLUSION.

(23) Finally it is urged that the policy now in vogue should be abandoned and that Indian trained Engineers should be restored to the Imperial Service on the following additional grounds:—

(*a*) Indian College Engineers have established brilliant records in the past and have in numerous instances held, and are still holding, the highest administrative appointments in the Indian Public Works Department with distinction. These facts have been duly admitted by no less a distinguished Indian authority than Lord Macdonnell who, in an address delivered at Rurki College on the 6th November 1900, alluded in the highest terms to the instances in which the Alumni of this Institution had established not merely Indian but European reputations. Lord Macdonnell specially instanced the names of Sir W. Wilcocks and Sir W. Garstin of Egyptian fame, who received their training at Rurki College;

(*b*) Whatever may have been the condition of the Indian Engineering Colleges at the time the Public Service Commission sat (and this as argued above did not justify the withdrawal from the public in India of that which they had possessed for so long a period of time) the standard of education imparted in these institutions has since been considerably raised. Rurki College is now admitted to be equal to any similar institution in Europe. The following is the testimony of persons whose opinions must prevail:—

(i) Lord Macdonnell in his address referred to above spoke of Rurki College in the following terms:—"This College is, I am assured by those competent to speak on the point now in a position to impart instruction both theoretical and practical, up to the standard of any similar institution in Europe."

(ii) Sir J. P. Hewett, Lieutenant-Governor of the United Provinces, in a speech delivered at Rurki College on the 27th October 1909, spoke of this institution and its Alumni in the following terms:—"Your assurance, Major Atkinson that it is the aim of yourself and your colleagues to keep the education given in Thomason College *abreast of the best technical education available in the Western World is amply vindicated* by the extremely high standard of education to which the students who are trained here attain. I have had the privilege of working in close conjunction with two of the most distinguished Alumni of the College, I refer to Mr. Goument, now Chief Engineer in the Buildings and Roads Branch of these Provinces and to Mr. Harriot, at present Superintending Engineer in the Central Provinces, but destined to reach a still more distinguished position in the Public Works Department. I have no hesitation in saying that these officers are excelled by none of their brethren in the department for professional skill, for initiative, or for a correct appreciation of the needs of the country. I have had opportunities of observing the same good qualities developing themselves in some of the younger men educated at this College, and I have no doubt that you and your staff will continue, in the future as in the past, to turn out a constant stream of trustworthy Engineers. Your College has recently been described by the Secretary of State as an institution with a large and illustrious history behind it and you rightly observe that if it is to maintain its *past pre-eminence*, it must keep abreast of the times and that therefore must be a continuous advance and constant and expensive improvement." The deep significance of this second utterance, by a Lieutenant-Governor in India, will be forcibly realized when it is remembered that it was uttered when the agitation against the changes of 1908, was at its highest and after Indian College Engineers had utilized the previous utterance of Lord Macdonnell and had held it out to the Secretary of State as conclusive proof that Indian trained recruits were not inferior to their English contemporaries. It is irresistibly clear that Sir John Hewett would not have spoken in these unambiguous terms, thereby presenting the Alumni of the Indian Colleges with another lever upon which to work, had he not been inwardly conscious that Rurki College did in fact turn out men of marked ability.

(iii) There is yet another public admission establishing the fact that Rurki College has nothing to fear from a comparison with any similar institution in Great Britain. The Honourable Mr. Goument, Secretary to the Government of the United Provinces, in a speech at Rurki College on the 14th July 1910, stated—"I think it may safely be said that this College is now in a position to impart an education, both theoretical and practical, up to a standard which compares very favourably with that of similar institutions in Europe. The following extract from a note recently recorded *by an expert* in your Visitors' Book bears out this statement. 'I have visited nearly every College of importance in India, but among all of them Rurki College alone appears to me to attain to the standard of a first grade Engineering College, the organisation and equipment are admirable and the arrangements for imparting practical training in Mechanical and Civil Engineering are hardly equalled in any institution in Great Britain.'

(*c*) it is claimed, therefore, and it is impossible to resist this claim that there is no difference between the professional education imparted at this institution and that received by the average Engineer recruited in England. On the contrary, it is a fact

in some cases that qualifications of Indian College Engineers are superior to those possessed by the latter, *e.g.*, where men who have only passed out of the Upper Subordinate Class at Rurki have proceeded to England and after undergoing a very meagre training for a short period in the elements of Engineering (at the Crystal Palace, for instance) have been appointed by the Secretary of State to the Imperial Service. These cases are well known both to the Government of India and to the Secretary of State;

(*d*) the Indian College Engineer also possesses the great and recognised advantage (on which great stress was laid when the institution of a Military Staff College in India was advocated) of having received his training in the country in which he has to practise his profession;

(*e*) that the Public Works Department is purely a professional and scientific service and has no share in the political administration of the country and that therefore the restoration of the alumni of the Indian Colleges to their former position, while gratifying the legitimate claims and aspirations of the domiciled European and Indian communities, without impairing efficiency (for the already high standard of the Indian Colleges could, if necessary, be raised still further) and giving a much needed impetus to higher technical education to which so much attention is being rightly devoted, would in no degree imperil British supremacy; and

(*f*) lastly the present policy is one which needlessly and unjustly enforces a distinction between two classes which is strongly and increasingly resented, and is in fact opposed to the highest principles of liberal statesmanship which to use the words of the present Prime Minister in his memorable speech at Birmingham in September 1909 aims at "Removing the domination of unjust monopoly and opening everywhere the gate to intelligence, to merit, and to energy."

Mr. J. Craig called and examined.

72,097. (*Chairman.*) The witness held the position of Executive Engineer and had been in the service for fourteen years. The bulk of the Provincial Service in Burma consisted of men promoted from the Subordinate Service, only about seven men having been recruited direct. The written statement represented the views of all the members of the Provincial Service.

72,098. The division into Imperial and Provincial branches was inherently unsound as the work done by both was precisely the same. In Burma the Provincial Engineer was given a charge of equal responsibility to that occupied by Imperial officers. For the present it was necessary to have a proportion of European officers in the Service, but he believed ultimately the service could be exclusively recruited from India. He did not think that officers coming from England had any special expenses beyond those incurred by officers recruited in India, as all officers had to keep up the same status. There might, however, be a certain difference in regard to the expenses attaching to the family of a European recruited officer. He would not agree that men recruited from Europe should receive anything in the nature of a foreign service allowance, as that would cause discontent among the men recruited in India.

72,099. For the superior service he would recruit half in England and half in India, and for India open competition between men drawn from the Indian colleges would be the best. He thought Rurki college was as efficient as any college in England but that view was not based on experience of English colleges as he had not visited any English colleges, but it was based on his experience of men recruited from some of those colleges who had served under him.

72,100. There should be a two years' probation both for those recruited in India and those recruited in England.

72,101. He had been present at the examination of the previous witness (Mr. Lewis) but did not agree with Mr. Lewis' scheme for bringing men out on a five years' contract; he did not believe men would come from England on such conditions. It was much more likely that they would come out on a two years' probation than under a five years' contract.

72,102. The creation of a family pension fund was very much desired by the service.

72,103. (*Lord Ronaldshay.*) The Provincial Service engineer was disqualified from holding any Imperial appointment in the Public Works Department. It was true that he was not disqualified from holding "any office," but he did not receive the same emoluments as the Imperial officer, and he took "any office" to mean any office without any distinction.

72,104. (*Mr. Chaubal.*) No one in the Provincial Service had yet become qualified for the post of Superintending Engineer or Chief Engineer.

72,105. (*Mr. Sly.*) With regard to the complaint that certain temporary engineers, whose college careers were not equal to those of men in the Provincial Service, were promoted to the Imperial Service, it was probably the case that the temporary engineers had had a long period of practical work in the department and that it was owing to their proved capacity that they were promoted. They were however promoted after the Provincial Service was formed, and if they were fit for the Imperial Service, Provincial officers should also have been promoted. It was really a reversal of policy because in any system of examination the top man was always selected. He did not mean to suggest, however, that promotion throughout a man's career should be regulated by his position at college or in the examination list.

72,106. (*Mr. Madge.*) Some of the men who had entered the subordinate service on account of there being no opening in the Provincial Service had worked very efficiently. The training in India was as good as that in England, and in some respects better, and his opinion upon that point was based on the experience he had had of the work of both classes of men. The Indian engineer was much better acquainted with India than the man who came from England and also was in a better position to deal with subordinates and workmen.

72,107. (*Sir Murray Hammick.*) The statement that temporary engineers had been appointed to the permanent service instead of Provincial Service men referred to India and had nothing to do with Burma.

72,108. He did not approve of promotions from the Subordinate Service to the Provincial Service. The subordinates should have their own graded service and should not look for promotion outside that service. Some men promoted from the subordinate service had made good Provincial officers. He urged that the Provincial Service should be abolished for Indian college engineers and that a Provincial Service should be established which would be entirely manned by men promoted from subordinate grades. The men taken from Rurki and the other engineering colleges should be taken straight into the upper service. He did not so much object to the promotion of men from the subordinate service under present conditions as to the whole system.

(The witness withdrew.)

R. C. Edge, Esq., Superintending Engineer, Bihar and Orissa.

Written Statement relating to the Public Works Department.

72,109. **(I.) Method of Recruitment.**—Since the abolition of the Royal Indian Engineering College, Cooper's Hill, the Imperial Service has been recruited by Engineers selected by a Committee in England.

There is no examinnation, but certain qualifications are required equal to those required for passing the examination for the associateship of the institution of Civil Engineers.

In the absence of a special College for training Engineers for India, this system is probably the most

satisfactory. Members of the service, however, consider that it is desirable that senior officers of the Public Works Department or railways should be more largely represented on the Selection Committee.

72,110. **(II.) Training and Probation.**—Recruits are selected from various Colleges and Institutions in the British Isles. On the whole this training is satisfactory, though it has no special reference to Indian conditions, as was the case with the course at the now defunct Royal Indian Engineering College. At present many of the men, who come out to India, have had little or no practical training in England. It would be an advantage to insist on a year's training on works at home before apointment to the Public Works Department.

There is no probationary period in India at present, and although it would have some advantages, it is not altogether desirable if proper care is taken in the selection of suitable recruits in the first instance.

72,111. **(III.) Conditions of Service.**—The number of officers employed should be such that it is always possible for an officer to obtain leave which is due to him. At present it very frequently happens that an officer is refused leave on the ground that there is no one to relieve him, although the number on leave at the moment is less than the proportion—supposed to be allowed for in fixing the cadre. The number of officers required will naturally vary from time to time, and the cadre should therefore be revised more frequently than at present.

Any Royal Engineer officers who may be drafted into the Department should be so placed in the list that they do not become senior in position to men who are senior to them in age.

72,112. **(IV.) Conditions of Salary.**—The pay of the Imperial Engineers was reorganised in 1908 and placed on an incremental basis. This gave improved pay to many, but at the same time exchange compensation, which was formerly drawn by officers domiciled in Europe, was withdrawn. This reduced the advantage in pay considerably, insomuch that it was found necessary in some cases to restore the exchange compensation in order to prevent officers from actually losing by the change. Moreover, the pay of the administrative grades was not altered, though the exchange compensation was withdrawn, with the result that all Superintending Engineers who have been promoted to that rank in the last few years are actually drawing less pay than they would if no change had been made in 1908. On the whole, therefore, it cannot be said that the present rates of pay are altogether satisfactory, having in view the rapidly increasing cost of living. It is fairly certain that very few officers are in a position to save anything from their pay to supplement their meagre pension on retirement.

Promotion to the administrative ranks is not a satisfactory footing. At present all Superintending Engineers in a province are on a provincial list, and promotions to the different classes are made on that list. This is very hard when there are two or more men of about the same seniority in one province, as the number of men in each class is fixed in a certain proportion, and some cannot therefore hope to rise to the 1st class through no fault of their own, though men junior to them are able to do so owing to more favourable circumstances in other provinces.

It has been suggested that this could be remedied by having only one class of Superintending Engineers starting on a salary of Rs. 1,500 (the pay of the present 3rd class), and rising by annual increments of Rs. 100 to Rs. 2,000 (the pay of the present 1st class).

Considerable hardship and pecuniary loss is often caused by the transfer of officers in the administrative grades from one province to another. It is very hard for a man who expects promotion to these grades in the province in which he has served all his service, to have another from outside brought in over his head, to block his promotion for the greater part of the remainder of his service. It should be made a rule that unless in very exceptional circumstances no transfer should be made between provinces unless it can be shown clearly that there is a serious block of promotions in one, or a great want of officers in the other.

72,113. **(V.) Conditions of Leave.**—The rules governing the grant of furlough are practically the same as those which apply to the Indian Civil Service, except in the most important particulars of leave allowance. In the case of the officers of the Indian Civil Service and Military officers under Civil leave rules, furlough allowances are subject, if paid at the Home Treasury, to a minimum limit of £500 per annum, or the salary last drawn, whichever is less, and to a maximum limit of £1,000 per annum. In the case of Civil Engineer officers of the Public Works Department, there is a minimum limit, and the maximum has been fixed at £800 per annum. This inequality may be realised by taking the case of a Royal Engineer officer in Public Works Department, who after eight years' service is entitled to the minimum furlough allowance of £500, where the Public Works Department officer does not reach this amount till after 18 years' service, his maximum furlough allowance after eight years' service being £279 per annum, which, it must be admitted, is quite insufficient.

These small furlough allowances to Public Works Department officers result in many men being unable to take the leave which is due to them, and which a due regard for health demands. The Government of India recently, in reply to memorials from officers of the Public Works Department, replied that this matter would be enquired into by the Royal Commission, and that no useful purpose would be served by considering the prayers of the memorialists at that stage.

Privilege leave.—Privilege leave can at present be accumulated to the extent of three months and combined with furlough. It frequently happens that owing to short establishment an officer is not able to avail himself of the full period when it becomes due, and hence any additional leave earned collapses through no fault of his own. It would be a great boon if in such cases the period of three months could be extended.

Study leave.—At present when an officer on leave desires to increase his knowledge of his profession and keep abreast of modern Engineering practice, he does so entirely at his own expense and with no help or encouragement whatever from Government.

It would be in the interests of the Government of India to encourage officers to visit works when on furlough, and they should be provided with every facility for doing so.

72,114. **(VI.) Conditions of Pension.**—The pensions which can be earned by officers of the Imperial Branch are briefly—

	£	*s.*	*d.*
After 20 years' service	350	0	0
After 25 years' service	437	10	0

For officers appointed before 1898 there are extra pensions of £87 10*s.* for three years' services as Superintending Engineer, or £175 for three years as Chief Engineer. For officers appointed after 1898 this extra pension has been reduced to £87 10*s.* for three years as Superintending Engineer, 1st class, or Chief Engineer, given at the discretion of the Government of India, and in the cases of officers who joined after 31st December, 1909, subject to the condition that the officer must not retire voluntarily before the completion of a total qualifying service of 28 years.

This scale of pensions compares very unfavourably with those for other scientific services in India. For example, the Indian Medical Service Pensions are far more liberal, and an officer of that service can rise to a pension of £1,050 per annum, against a maximum of £525 for officers now joining the Public Works Department. Again an officer of the Indian Army can obtain a pension of £1,000 per annum, and the scale throughout is far higher than that for the Public Works Department. It is claimed that the Public Works Department should be put on the same footing in the matter of pensions as other Scientific Services.

This matter of pensions is the greatest grievance of Civil Engineer officers of the Public Works Department. The retiring pensions to which they become entitled under the existing rules are totally inadequate for their support after retirement. Moreover, their emoluments during service are not sufficeint to enable them to save or make any adequate provision for their

families should they die in harness, or to supplement their meagre pensions should they live to draw them.

Memorials have been addressed to the Secretary of State in recent years praying for an improvement in this respect, and the answer has been received that the matter comes within the scope of enquiry of the Royal Commission.

The pensions are purely personal, and cease at the death of the officer, and there is no official Family Pension Fund for the Public Works Department as in the case of the Indian Civil Service and Military Services. This inability to make suitable provision for his family is a constant source of anxiety, and it is strongly felt that there should be some means of providing for an officer's family in the event of his death.

Pension has been officially defined as deferred remuneration, *i.e.*, that a part of an officer's salary is kept back to provide his pension. Hence it is hardly just that his family be deprived of any part of this should he die prematurely. Officers of the Public Works Department would heartily welcome a scheme worked out on an actuarial basis by which some provision could be made for their wives and families.

The existing Provident Fund does not meet such cases as it is limited to the amount plus 4 per cent. compound interest which the subscriber has paid into it, and is therefore of little avail in the case of premature decease.

72,115. **(VII.) Such limitations as may exist in the Employment of Non-Europeans and the working of the existing system of division of Services into Imperial and Provincial.**—The number of Indians appointed to the Imperial Service at present is 10 per cent., and there seems no reason to exceed this number at present, as there is the Provincial Service open for them. The Provincial Service is recruited from Engineers trained in Indian Colleges, and as far as the Province of Bihar and Orissa is concerned, they now come entirely from the Sibpur Engineering College.

It cannot be said that as a class they are at present equal to the Imperial Engineer, but, possibly in future and with better training they may improve, in which case it would be desirable to make the Provincial Service entirely subordinate and let all Engineer Officers —both European and Indian—be in one service with the same rates of pay. The present arrangement of having both Imperial and Provincial Engineers on one list is unsatisfactory and leads to many anomalies. An unsatisfactory feature of the present training of Provincial Engineers is that both Engineers and subordinates are trained together; one fortunate man becomes an Engineer officer, and the remainder or such as join the Public Works Department become his subordinates.

72,116. **(VIII.) Relations of the Service with the Indian Civil and other Services.**—The present relationship is satisfactory, and should not be altered.

72,117. **(IX.) Any other points within the Term of Reference to the Royal Commission.**—Officers of the Public Works Department in common with those of other services feel that the present travelling allowances when on transfer are very inadequate.

While admitting that transfer in the interest of the Public Service must inevitably involve some expense to the officer concerned, it is felt that in many cases these expenses are greater than an officer should be called upon to incur, especially when transfers are long or frequent. In the case of a married man, the actual travelling expenses of his family might well be allowed.

It has also been suggested that the provision of necessary furniture in all official residences would greatly reduce the loss due to constant buying and selling of furniture or the cost of carriage from one place to another. If necessary, some addition could be made to the rent to cover the cost of the furniture.

Mr. R. C. Edge called and examined.

72,118. (*Chairman.*) The witness was an executive engineer of 19¼ years' service and represented the thirty-one officers in the Imperial Branch of the Public Works Department of Bihar and Orissa. The department consisted of twenty-four Europeans and seven Indians, some of the latter having been recruited before the Provincial Service was established and one by the Secretary of State after the abolition of Cooper's Hill.

72,119. An examination coupled with nomination for appointment to the Public Works Department would be an improvement on the present system. The ideal age for recruiting would be twenty-two or twenty-three and it was important that a man should have had a practical experience in England before he came out. He believed that probation in India would have an adverse effect on recruitment. It might be reasonable in the interests of the service that there should be power at the earliest date to reject an officer who proved himself unsuitable. If, after two years, it was found he was unsuitable it would be less harmful to the recruit to reject him then than to reject him at a later period. It very rarely happened that a man was rejected now. From the point of view of the interests of the service rejection during the first two years would be on the whole the best, though it might possibly be hard on the recruit.

72,120. In Bihar and Orissa only one Royal Engineer had been appointed to the Public Works Department and he had not yet joined. He would like to see Royal Engineers put in the same position they would be in if they had joined the Works Department in the ordinary way.

72,121. He had no objection to the 10 per cent. rule with regard to the recruitment of Indians in England, and he thought most of the officers in the Province were of the same view.

72,122. A central college for India would offer much the best means of recruiting Indians to the superior posts of the department.

72,123. There was some discontent amongst Provincial Service officers in regard to the division of the service into two branches, Imperial and Provincial, but he had not noticed that it was very acute. If all invidious distinctions were removed and were higher pay given to the European in the form of a foreign service allowance the discontent would to some extent be removed.

72,124. He agreed with the observation in the memorandum from the Imperial officers of the Province that salaries on the whole were satisfactory provided an adequate pension was given, and he also agreed that the present inequalities in promotion to the grade of Superintending Engineer could be remedied by having only one class of Superintending Engineer on a time-scale running from Rs. 1,500 to Rs. 2,000 a month.

72,125. Considerable hardship and pecuniary loss was caused by the transfer of officers from one Province to another, but he was unable to give statistics to show to what extent such transfers had been made. There had recently been a case in the province where a man had been brought in from outside and had blocked everyone's promotion; he had come from the Central Provinces where promotion was better than it was in Bihar and Orissa. There were a good many instances of that kind in Bengal some years ago. From the point of view of the service there were certain advantages attached to transfers.

72,126. He did not regard the granting of furlough after eight years' service as a serious hardship. It would be to the interest of the service if certain facilities were given for study leave.

72,127. He was in favour of substituting for the present pension scheme a system under which part of the money would be in the form of a pension and part in the form of a capital sum; that would be acceptable to officers as it would enable them to leave something to their families.

72,128. (*Sir Murray Hammick.*) The most pressing grievance in the Public Works Department at present was the question of pensions. He looked on the establishment of a family pension fund as of considerable importance and desired to see a scheme introduced under which officers would be called upon to make considerable contributions towards the fund. He believed it would be popular in the service.

72,129. A young officer on first coming out probably got into debt in connection with his preliminary

expenses, but his debts were not so serious then as they became later on in his service.

72,130. With regard to transfers, he believed that if Government supplied furnished houses it would reduce the expense of transfers very considerably. It would be quite possible for the Government to lay down a scale entitling an officer after so many years' service to the cost of removal of so many maunds of luggage, so many horses, carriages, etc. Transfers were very frequent in Bihar and Orissa and also very expensive.

72,131. (*Mr. Abdur Rahim.*) He had always understood that pension was deferred pay for the purpose of providing for an officer after retirement. It was only fair that Executive Engineers when they were not promoted to administrative rank through no fault of their own should be given a certain allowance. To some extent pay was regulated by the duties performed, but a man required some compensation for not being promoted owing to the fact that there was not a vacancy.

72,132. (*Mr. Madge.*) Practical training in England was received by a good many officers at present and he thought all officers should have it.

72,133. The paragraph in the written statement that the present training was satisfactory though it had no special reference to Indian conditions as was the case with the course at Cooper's Hill, referred to general professional education, and not to practical training. It was purely a matter of opinion, based on a man's experience, whether he favoured training in England or in India.

72,134. The only remedy he could suggest for the present grievance in connection with the Royal Engineers was to put the Royal Engineer in the place he would have occupied had he joined the service in the ordinary way. A Royal Engineer could be put in at any stage provided due consideration was given to the claims of the men in the service. It was not a question of salary but of position on the list.

72,135. (*Mr. Fisher.*) He had had no personal experience of the Indians who had come out under the 10 per cent. rule, but he had heard that men who had failed for the Provincial Service sometimes got into the Imperial Service in England. He would favour any scheme under which a picked number of Indians would be sent to England for training and then drafted into the Imperial Service, but he would rather have them trained at a really good central college in India and sent to England for a year or two afterwards.

72,136. (*Mr. Sly.*) The system followed by the Public Works Department in connection with work was almost entirely one of petty contracts, except in the case of very large works. In the building of the capital at Bankipur work had been given to large English contractors and such contractors had also been employed on building canals, but not with much success.

72,137. Since the Province had been formed no one had been recruited to the Provincial Service and therefore he could not say what the present system of recruitment was. So far as he knew no orders had been issued with regard to not taking men from Sibpur.

72,138. The junior members of the service agreed that the question of pension was a most important one but they did not feel it so strongly as the more senior men. He had consulted all the members of the association and both young and old agreed that the matter of pension was of the first importance.

72,139. With regard to the eight year rule as to furlough, some of the junior men thought the period should be five years. He had not heard that the eight year rule deterred recruits from coming forward for the service, as they could always go home on special leave before the expiry of that period.

72,140. (*Mr. Chaubal.*) The witness saw no reason for increasing the 10 per cent. of Indians recruited in England so long as the Provincial Service existed. In the old days, when there was no Provincial Service, the percentage might have been thirty, but he saw no reason why it should be so high as that now. The remark in the written statement that as a class the Provincial Engineers were not at present equal to the Imperial Engineers, but that possibly in future with better training they might improve, was based on his experience in Bengal and Bihar and Orissa; confidential reports would show that the Provincial Service officer was not as good in his work as the Imperial officer. He agreed they might also show cases of unsatisfactory work on the part of Imperial Engineers.

72,141. (*Mr. Green.*) He had not suggested that Assistant Engineers after the eleventh year of their service should be given an allowance if there was a block in promotion but he would endorse the suggestion in the case of those who were qualified for the position of Executive Engineer.

(The witness withdrew.)

Babu Jnananjan Saha, Executive Engineer, Bihar and Orissa.

Written statement relating to the Public Works Department.

72,142. Under the nine heads referred to in paragraph 3 of letter, dated the 1st August 1913, from the Joint Secretary to the Royal Commission, on the Public Services in India, to the Chief Secretary to the Government of Bihar and Orissa.

Referring to the Memorandum by the Indian trained officers of Bengal, a copy of which is printed in paragraphs 71,874–81, I would say that I generally agree with it, but I would add the following notes under the different heads.

72,143. **(I.) Method of Recruitment.**—Recruitment both in India and in England should be—

(*a*) By free and open competition, and at least three candidates should compete for each appointment which is to be made in order of merit.

(*b*) Half in England and half in India for the present and as time goes on, the proportion of Recruitment in India should be gradually increased.

(2.) At present only one man is appointed annually to the Engineer establishment direct from Sibpur Engineering College for Bengal, Bihar and Orissa. The number should be increased to 50 per cent. of the total number of annual recruits for these provinces from England and India.

In the last five years there were 16 recruits from England and five from Sibpur. Total number being 21, annual number of recruits is nearly four. Therefore number of guaranteed appointments from Sibpur should be increased to two every year if it is to supply the demands of the above provinces only.

(3.) Rurki College does not admit students from Assam and Burma. But successful men from this College are appointed in these provinces. This is unfair—Rurki College should be thrown open to the students from Burma and Assam. If this is not feasible, then the number of guaranteed appointments of Sibpur Engineering College should be still further increased to four every year, to meet the 50 per cent. demand of these provinces, students from which are eligible for admission into this College.

At present about forty students are admitted annually to Sibpur and they compete for a single guaranteed appointment. The number of admission, which is very large, should not be increased though the number of appointments is increased to four to meet the demands of Bengal, Bihar and Orissa, Assam and Burma.

(4.) The number of appointments in the other Engineering Colleges (Rurki, Madras and Poona) of India, should be increased in proportion to the requirements of the different provinces for which, men are trained in the above Colleges.

(5.) Course of training of Sibpur Engineering College extends over five years. After four years of training in the College classes, University examination is held, and out of the successful students a certain number is selected in order of merit for practical training of one year in the Public Works Department. Similarly a certain number of passed students from the Apprentice class of Sibpur College

and from Dacca and Bihar School of Engineering are selected to undergo a course of practical training for one year under Public Works Department. After completion of their training the Engineer students are examined with the other students in some simpler subjects and in riding, to which marks are allotted. Marks obtained by them in workshops during their College and School training are added to the above marks. Of the Engineer students, who head the list in the above subjects obtains the guaranteed appointment and is appointed as Apprentice Engineer in Public Works Department.

This system of recruitment is unsatisfactory. Students of Sibpur Apprentice Class and of Dacca and Bihar Schools of Engineering are better trained in Workshops than the students of Sibpur Engineer class, and it does not infrequently happen that the former stands first in the combined list by virtue of their having obtained higher marks in Workshops during their school training.

Riding is absolutely necessary for the Engineers, but marks obtained in it should not in any way interfere with the position of a student secured by him in the University examination, and this is not done in any other Department. It is quite sufficient if a student can show his proficiency in riding. Similarly, marks obtained by the Engineer students in Workshops in the 1st and 2nd year class examinations, should not decide their position for the appointment. Result of the present system of recruitment is that the Engineer student who was good in Workshops during his College training and who excels in riding usually gets the appointment though he may not be as strong as others in theory and other subjects which they learn during their course of practical training in Public Works Department.

(6.) The course of training is Sibpur College which is four years at present, can be reduced, with advantage, to three years. After passing the B. E. examination the students should undergo a course of practical training for one year in Public Works Department and appointments should be given to the graduates in order of their positions in the University Examination provided he completes his practical training satisfactorily and can show his proficiency in riding.

72,144. **(II.) System of Training and Probation.**—One year's practical training in the Public Works Department in India is sufficient to qualify the successful students for appointment as Assistant Engineer. At present they are appointed as Apprentice Engineer and remain on probation for one year. This is unnecessary. Graduates after completion of their practical training should be appointed as Assistant Engineers, third grade. But for special branches of Engineering, *e.g.*, electricity, mining, sanitation, etc., practical training may be done with advantage in England and suitable allowance should be given to the probationers for the purpose.

72,145. **(III.) Conditions of Service, (IV.) Conditions of Salary, (V.) Conditions of Leave, and (VI.) Conditions of pension.**—Whether an Engineer is recruited in India or in England his emoluments and other conditions noted above, should be precisely the same and should be determined solely by the work he does and responsibility he bears and should have nothing to do with the place of his recruitment.

72,146. **(VII.) Limitations in the Employment of Non-Europeans and working of the existing system of division of Services in the Public Works Department into Imperial and Provincial.**—Recruitment both in India and in England should be open to all British subjects equally, irrespective of caste, colour and creed.

Division of the Public Works Department into Imperial and Provincial sections has been anything but a success and has created constant heart-burning among the Provincial Officers, who do exactly the same work and bear exactly the same responsibility as the Imperial men. It is therefore urged that the said differentiation, which is illogical and unjust, should be abolished, and that the alumini of the Indian Engineering Colleges should be restored to the position they formerly occupied, that is to say, there should be only one service in the superior establishment in the Public Works Department.

BABU JNANANJAN SAHA called and examined.

72,147. (*Chairman.*) The witness represented the Provincial Engineers, thirteen in number, of Bihar and Orissa, and occupied the position of an Executive Engineer. He received his training at Sibpur College and had been in the service for 14½ years. The written statement represented the views of the majority of the Provincial men.

72,148. He recommended the abolition of the division into Imperial and Provincial and the recruitment of a superior service partly in England and partly in India by open competition. He preferred one competitive examination for the whole of India rather than an examination in each Province, but he had no strong view on that point. He agreed that there would be the danger under a system of open competition of officers being drawn from one Province over a series of years. As a rule it was advisable that officers should occupy positions in the Public Works Department of their own Provinces.

72,149. The training of officers was adequate in the Indian colleges but he wished to see the present four years' course at Sibpur College reduced to three years, as four years was too long. One year's practical experience would be quite sufficient and the training should be carried out in India. There should be promotions from the subordinate services to the superior service, the proportion being left to the discretion of Government according to the number of officers qualified.

72,150. Temporary Engineers should be placed on a regular incremental scale, without pension. They should be recruited for a period of five or six years on a commencing salary of Rs. 200 or Rs. 250, with annual increments of Rs. 30 or Rs. 35 and should be placed in a cadre of their own. The work done by the Temporary Engineer would be such as would be done by subdivisional officers. There were only four Temporary Engineers in Bihar and Orissa. Probably it might be a better principle to appoint Temporary Engineers merely for temporary work, as that would not necessitate so long a period as five years except in rare cases.

72,151. The pay of all officers doing the same work should be similar, but a compensation allowance might be given to those coming from England.

72,152. He did not think a family pension fund was necessary.

72,153. (*Mr. Sly.*) The present rule of recruitment to the service was nine from Indian colleges and five from other sources and was fixed on a basis of 30 per cent. recruited in India. Of the 70 per cent. recruited in England, 10 per cent. were Indians. Therefore so far as Indian recruitment was concerned the percentage at present was 37 per cent., as compared with 30 per cent. before the Public Service Commission. The direct recruitment from Indian colleges had been reduced but there had been an increase in the percentge of Indians recruited. The promotion of subordinates was desirable.

72,154. (*Mr. Abdur Rahim.*) There were no Bihari Engineers in the Public Works Department. There were no students from Bihar in Sibpur College during his time, but he did not know whether there were any there at present.

(The witness withdrew.)

W. S. Dorman, Esq., Executive Engineer, Punjab.

Written Statement relating to the Public Works Department, being a Memorandum of the Civil Engineers' Association.*

72,155. **(I.) Methods of Recruitment.**—There is a strong wish among members of this Assocation that a residential College, on the lines of the late Royal Indian Engineering College, Coopers Hill, should be established in England, from which Imperial Engineers for the Public Works and Railway Departments would be recruited. The Association is practically unanimous in considering that the training which such a College would afford would foster an "*esprit-de-corps*" which is not to be anticipated among men recruited in the open market, and that this spirit and the qualities which it engenders are of the utmost value to the individual, to the Department, and to Government. The Association also considers it to be an advantage, that the students would be kept under close observation for a considerable period, and there would be less likelihood of men unsuited to the needs of India being appointed than where recruitment is made in the open market. The Association, however, realizes, having regard to the many Institutions in the British Isles which give a training in Engineering Science adequate to the needs of the Public Works Department, that the establishment of such a College may now be considered impracticable, and that selection from the open market must be accepted as an established fact.

Assuming then that recruitment by selection is maintained this Association urges that at least 50 per cent. of the members forming the Selection Committee should be senior officers of the Public Works and Railway Departments, either on the active or retired lists, as it is felt that the intimate knowledge of these Departments and their requirements possessed by such officers, would be of much value in assisting the Committee in their selection of the right class of man.

72,156. **(II.) Training and Probation.**—*Training.*—The Association suggests that it should be made a condition of appointment, that recruits should have had at least one year's practical experience on Engineering Works in the British Isles, in addition to an adequate theoretical training.

Probation.—It is considered that circumstances, which render a probationary period possible and desirable in the case of engineers appointed to State Railways, do not exist in the case of the Public Works Department. While the members of the Association in the Public Works Department consider that a probationary period is undesirable in the case of engineers appointed to the Buildings and Roads and Irrigation Branches, the views of Railway engineers are as follows:—"It not infrequently happens that men appointed as engineers on State Railways retire after a few years' service, to enter employment elsewhere. It is unquestionable that service on Indian railways offers a valuable training, and increases rather than diminishes a young engineer's prospects of securing employment on railways outside Great Britain. Railway engineers, who are members of this Association, feel that advantage should be taken of this to introduce a probationary period of service, extending to two, or at most three, years. At the close of this period the probationer would be appointed permanently, if both he and Government desired this, his probationary service counting for pension.

"Under such an arrangement Government would have an opportunity of dispensing with the services of men, who, though technically qualified and innocent of such faults as would merit their dismissal, had not proved themselves entirely suitable for the particular duties which they would be called upon to perform on Indian State Railways. No stigma would, in these circumstances, attach to failure to secure or to accept a permanent appointment, and probationers would ordinarily be in a better position to procure appointments elsewhere, at the close of the probationary period, while Government would undoubtedly profit by the opportunity for closer selection thus afforded. In the case of State Railway Engineers, in fact, Government does not make as good a bargain as it might in view of the valuable training in Railway Engineering which the early years of service offer."

72,157. **(III.) Conditions of Service.**—(i) The Association urges that the cadre of the Permanent Engineers should be more frequently revised than has been the case in the past. It is advisable that the number of Permanent Engineers should more closely accord with the number of permanent appointments, and that less reliance be placed upon making up deficiencies by the employment of Temporary Engineers. In support of this suggestion the Association would call attention to the following extract from the Report of the Irrigation Commission of 1901, which, although recorded in connection with the Irrigation Branch, applies equally to all Branches. "Paragraph 306. We trust therefore, that the great importance of providing an adequate staff of Engineers for the maintenance and management of the larger irrigation works may be steadily borne in mind whenever the revision of the establishment scale is under consideration, and that it may not be supposed that temporary establishments only are required, which can be discharged or reduced when works are brought to completion. Canal management is as important a part of the duties of the Public Works Department as canal construction, and we may add that success in the design and construction of new works, depends to a great extent on the management of those which have been completed."

(ii) The conditions under which Royal Engineers are drafted into the Public Works and Railway Departments have affected adversely the position and prospects of a large number of Civil Engineers. Royal Engineers brought in are usually credited with extra departmental service to such an extent as to give them departmental seniority over Civil Engineers who are senior to them in age, and of many years standing in the Departments. The effect on a Civil Engineer thus superseded is utterly disheartening; if senior, his promotion to administrative rank is retarded, or he may even be prevented from ever reaching administrative rank, and, if junior, it may result in delaying him from being placed in a Divisional charge. Whatever form it may take, the frequent result it to subject him at one time or another to a heavy pecuniary penalty. The Association recognises that it is necessary in the interests of Government, that employment should be found for Royal Engineers in the Departments, but it is strongly urged that in justice the appointments should be made in such a manner as not to impair the prospects of Civil Engineers of the same age already serving in the Departments.

(iii) Similarly it is urged that if Government transfer any Temporary Engineers now serving in the Departments to the permanent scale, the same principle should be observed to safeguard the prospects of officers already on that scale, as in the case of Royal Engineers.

(iv) Future appointments of Temporary Engineers should only be made on the specific understanding that the holders of the same will not under any circumstances be brought on to the permanent scale. It remains with Government, if it is considered expedient, to improve the Temporary Service as such. Thus the improved provident fund for temporary employes on State Railways might be extended to all Temporary Engineers in the Public Works Department.

(v) Article 649 of the Civil Service Regulations which provides for the compulsory retirement of Civil Engineers, who on attaining the age of 50 years have not been promoted to the rank of Superintending Engineer, should, the Association thinks, be more rigidly enforced in the case of officers, who on reaching that age are reported as not qualified for promotion to the rank of Superintending Engineer.

* This Written Statement was prepared by a Special Committee of the Civil Engineers' Association consisting of the following Members:—The Hon. Mr. R. P. Russell, Messrs. M. Nethersole, F. E. Gwyther, J. Coates, A. R. Astbury, R. L. Colbourne, and P. C. Young. Mr. C. D. Gee, General Secretary of the Civil Engineers' Association, acted as Secretary.

(vi) In paragraph 80, Volume 1, of the Public Works Department Code the principle is laid down, that promotion to the Administrative Ranks should be by a system of selection as opposed to that of seniority. This Association recommends that this principle be more closely followed than at present.

72,158. **(IV.) Conditions of Salary.** — *Present Scale of Pay.*—In 1908 the scale of pay of the Public Works Department was reorganized and placed on an incremental basis, but at the same time the exchange compensation formerly given to officers was withdrawn. The net increase in actual emoluments was not commensurate with the increased cost of living in India, which has been so marked a feature of the last decade.

Below proposals are advanced for the improvement of furlough and pension allowances, which will serve to alleviate those hardships which are most severely felt, and in the belief that these proposals cannot fail to receive favourable consideration the Association refrains from making specific suggestions regarding the improvement of the scale of pay generally. However, if the Royal Commission, on the careful consideration of the question in regard to other departments or services, consider that the increased cost of living deserves an increase in the salary as at present drawn, this Association urges that the Public Works and Railway Departments should participate in any such general improvements as the Commission desire to recommend.

The following cases of individual hardship which may arise owing to irregularity of recruitment are brought to notice, and suggestions put forward for their mitigation.

(i) Under the reorganization scheme of 1908 it is ruled that an officer may not draw more pay than Rs. 800 per month unless he is in charge of a division, or in charge which in the opinion of the Local Government is of equal importance. This is unjust to an officer who, though fully qualified, does not obtain a divisional charge simply because there is no vacancy for him. It is strongly urged that the rule should be amended to the effect that an officer of the Imperial Service reported as fit to hold a divisional charge, should continue to receive the ordinary increments laid down in the scale, irrespective of his being in actual divisional charge.

(ii) Under the reorganization scheme Executive Engineers attain their maximum pay of Rs. 1,250 per mensem after 19 years' service. It is urged that if, on account of there being no vacancy, an Executive Engineer, though otherwise qualified, is not promoted to Superintending Engineer's rank on completing 23 years' service, he should receive a personal allowance of Rs. 150 per mensem, and should continue to draw the same until such time as he is promoted to administrative rank.

Pay of Chief Engineers.—The present division of the rank of Chief Engineer into two classes, and the variation of local allowances as Secretary to a Local Government, gives rise to the anomaly that a Chief Engineer may be drawing less emoluments than a Chief Engineer junior to him in service in another province, although the work and responsibilities attached to all such posts are exactly similar.

The pay of a first class Chief Engineer is generally equal to that of a Commissioner of a division, and whereas the area, over which the latter exercises control, constitutes only a small portion of a Province, the responsibility of the former extends over a whole Province. The number of Chief Engineerships throughout the whole of India is small, and with the exception of the post of Secretary to the Government of India in the Public Works Department and that of Inspector General of Irrigation, they are the only highly paid posts to which an officer of the Public Works Department can hope to attain. On the other hand there are a number of Commissionerships in each Province in addition to many other high offices, both with Local Governments and with the Government of India, which fall to the lot of officers of the Indian Civil Service. Having regard to these facts it is not considered too much to urge, that there should be only one class of Chief Engineer, and that the salary attached to the appointment should be Rs. 3,000 per mensem irrespective of whether a Secretaryship to a Local Government goes with the appointment or not. In this event the local allowance of Rs. 250 or 150 a month, according to whether a Chief Engineer is a Secretary to a Local Government or Local Administration, might be withdrawn.

As regards Chief Engineers in the Railway Department the remarks which have been made as to the responsibilities of Chief Engineers in the Public Works Department "*mutatis mutandis*" apply, while the present pay of the Engineers-in-Chief of State Railways in India compares most unfavourably with that of men in a similar position in different parts of the world.

Secretary to the Government of India in the Public Works Department.—For reasons similar to the foregoing, it is considered that the duties and responsibilities attaching to the post of Secretary to the Government of India in the Public Works Department, which appointment is invariably held by an officer specially selected from among Chief Engineers and usually of much longer service than any other Secretary to the Government of India, warrant the appointment being paid at the same rate as Secretaries in the Home, Finance, and Commerce and Industry Departments, viz.:—Rs. 4,000 per mensem.

72,159. **(V.) Conditions of Leave.**—*Furlough.*—The amount of furlough, which Imperial Officers of the Public Works and Railway Departments appointed in England can earn is generally considered sufficient. The rules governing the grant of furlough are practically identical with those which apply to the Indian Civil Service and Military Officers subject to Civil leave rules; except in the most important particular of leave allowances. In the case of officers of the Indian Civil Service and Military Officers under Civil leave rules, furlough allowances are subject, if paid at the Home Treasury, to a minimum limit of £500 per annum, or the salary last drawn, whichever is less, and to a maximum limit of £1,000 per annum; whereas for Civil Engineer Officers of the Public Works Department there is no minimum limit and the maximum has been fixed at £800 per annum. The present furlough allowances permissible to Imperial Civil Engineers are as follows:—

Years of completed Service.	Maximum furlough pay. £
8	279
9	297
10	316½
11	337½
12	360
13	382½
14	405
15	427½
16	450
17	472½
18	495
19	517½
20	540
21	555
22	562½
3 years as Superintending Engineer, 3rd grade.	675
3 years as Superintending Engineer, 2nd grade.	787½
Thereafter...	800

As long ago as 1870, in Despatch No. 43 P. W., dated 28th March, the Government of India said:—"Section 16 with reference to paragraph 4 of Your Grace's Despatch under reply, we may remark that we have already recommended the equalization of the pay of the Military Branches of the Department, and we are gratified to find this proof that Her Majesty's Government are likely to receive that proposal favourably. On this point we only add that we shall be glad to see some plan adopted by which the furlough allowances of Civil Engineers shall be equalized with those of Military Officers in the Public Works Department and, so far as practicable, the advantages of pension also." This hope has been reiterated many times by the Government of India and by different Secretaries of State since the date of that Despatch. It is, however, a hope that remains unrealized up to the present day, since a Royal Engineer in the Public Works Department, with 8 years' service to his credit, is entitled to almost double the furlough allowances of a Civil Engineer Officer doing exactly the same class

of work and having the same service in the Department. A Civil Engineer is obliged to complete 18 years' service before he can claim an allowance approaching that which a Royal Engineer is entitled to after 8 years' service.

The present allowances are so inadequate that a large majority of officers cannot avail themselves of the furlough due to them, even though the state of their health urgently demands that they should do so. That such is the case is assuredly not in the best interests of the general Administration. The question of leave allowance is raised in the last paragraph of the Memorials recently submitted by officers of these Departments; copies of which are attached to this Memorandum as Appendices 2 and 3. The reply given to the Memorialists by the Government of India was that:—" .....Pensions and leave are subjects of reference to the Public Services Commission, and as no doubt the Commission will inquire into these matters and submit recommendations, the Government of India consider that no useful purpose will be served by considering the prayers of the memorialists at this stage." (Government of India's letter, Public Works Department, No. 1399-1408 E, dated July 23rd 1913.)

In these circumstances it is confidently hoped that the Royal Commission will be able to recommend that the leave allowances sanctioned for officers of the Indian Civil Service, and Military Officers subject to civil leave rules, may be made applicable to Civil Engineer Officers of the Public Works and Railway Departments on the Imperial list. There is no valid reason why they should receive less favourable treatment than the other officers named. It is pointed out that feeling on this question is very strong, and that communications received from members of this Association show that there is great discontent throughout both Departments regarding the inadequacy of leave allowances.

It is urged that where the allowances are drawn in India they should be paid in the equivalent in rupees, at fifteen rupees to the pound sterling.

Furlough earned by an officer should be granted at any time after the completion of eight years' service, subject to the exigencies of the service, unless the applicant has returned within eighteen months from privilege leave covering a period of three months.

Special Leave.—The existing rules regarding the grant of special leave require no alterations, but the allowances should be the same as in the case of furlough.

Privilege Leave.—(i) Under the present rules an officer can earn privilege leave to the extent of one calendar month for every eleven complete calendar months of duty, and such leave is cumulative up to a period of three months only. In the case of officers who have accumulated the full period it frequently happens that the exigencies of the public service prevent their being granted privilege leave when they desire it, and this leads to the leave lapsing through no fault of their own. It would in a measure mitigate against this loss of leave on full pay which an officer has fairly earned, if the cumulative period were extended from three to six months.

(ii) An officer should be allowed to avail himself of all privilege leave due to him immediately prior to retirement, and be permitted to retire from the service at the end of his leave, without having to return to duty as he is now obliged to do. This concession has already been made where privilege leave is combined with other leave, and its extension to privilege leave alone, besides removing a legitimate grievance among officers of the Departments, would lead to much less administrative inconvenience than is now the case.

Study Leave.—Modern Civil Engineering is a highly specialized profession and progress in the methods of construction is very rapid. In view of the vast undertakings of the Government of India in the Public Works and Railway Departments, it is essential for efficiency and economy, that the Engineering Staffs of these Departments should keep themselves abreast of modern engineering practice. Engineers can only accomplish this by visiting and studying works of special interest in progress in different parts of the world. That the importance of this is recognized by other nationalities is instanced by the number of engineers who are commissioned by their respective Governments or private employers, to visit works in India, in order to study Indian methods. The majority of Civil Engineers serving in these Departments who wish to visit works in the British Isles, and other countries, have to do so as private individuals, and entirely at their own expense unless they are placed on deputation, or are specially permitted to visit certain works while on leave, permission in this case usually being given only when Government require special information regarding a particular aspect of a project. In the latter case certain travelling and other expenses are allowed, but the time spent in the visits counts against the officer's period of leave. This Association recommends that officers of the Public Works and Railway Departments should be encouraged to visit works outside India, and that they should be provided with every facility for doing so. The Association thinks that either new rules should be introduced to admit of these facilities being granted, or that there should be a much more liberal interpretation of the existing rules regarding the placing of an officer on deputation.

The following instance of study leave obtaining in another professional service is cited.—In the Indian Medical Service study leave is granted in England up to one year out of total service in addition to furlough, for the purpose of allowing an officer to study any particular aspect of his profession which he may desire. During this period he receives furlough pay and lodging allowance amounting to four to eight shillings per day.

72,160. **(VI.) Conditions of Pension.**—*Retiring Pension.*—The greatest grievance of Civil Engineer officers of the Public Works and Railway Departments and one which is most sorely felt is the totally inadequate retiring pension to which they become entitled under the existing rules. Many efforts have been made, spread over a period of forty years or more, to obtain amelioration in this respect. Both the Government of India and different Secretaries of State have long recognized that all was not well, and new rules and conditions have been introduced to improve matters, but the net result has been that the present pensions are actually less than they were 40 years ago, when the qualifications demanded from men joining the service were not as high as they are now, and when the cost of living was considerably less. A short history of the Public Works Department pension rules is attached to this Memorandum, Annexure V. Numerous memorials on this subject have been submitted to the Government of India and H.M.'s Secretary of State during the last 6 years by officers of these Departments. Copies of these are given in Annexures I, II, III attached*. The first memorials were submitted in 1907, but the petitioners were favoured with no reply up to August 1912, when they were informed by the Government of India in their letter No. 942-E., dated 30th August 1912, Annexure 4, that no decision could be arrived at pending the receipt of the report of the Royal Commission on the Public Services in India. It is to the Royal Commission, therefore, that the Civil Engineer Officers now look for redress of this long standing grievance, and it is strongly and respectfully urged that the scale of pensions prayed for in the memorials of 1912–13, Annexures 2 and 3, is the least which can in equity be recommended.

Further, that as this grievance was brought prominently to the notice of the Government of India, in the memorials of 1907–08, to which they vouchsafed no reply, and as in the meantime a number of officers affected have been placed on the retired list and many more will probably be called upon to retire before a decision is arrived at, any improvements made in the scale of pensions should have retrospective effect, at least from the year 1908.

Invalid Pensions.—Prior to 1884, invalid pensions granted to Civil Engineer Officers of the Public Works Department on the Imperial List were governed by article 474 of the Civil Service Regulations; this article also governed the pensions of all officers belonging to the Uncovenanted Services as then termed. In Lord Kimberley's Despatch of 1883 referred to on page 4 of this Memorandum, (*vide* Annexure V.

* *Vide* Appendix XIII.

page 147), a new scale was introduced for Imperial Engineers and Telegraph Officers, with a view to ameliorating their conditions of service, this scale is covered by article 641 of the Civil Service Regulations. Under this article the scale has been increased from $\frac{1}{60}$ths of average salary for 10 years completed service, $\frac{11}{10}$ths for 11 years, and so on, to $\frac{20}{60}$ths for ten years, $\frac{21}{60}$ths for 11 years and so on, but at the same time the maxima limits have been reduced from those allowed by article 474. How this rule brought in with the object of improving conditions in certain Services adversely affects officers at the present time, and how much better off an invalided engineer would have been under Civil Service Regulations, Article 474 is clearly shown from a comparison of the columns in the table below.

Years of completed service.	Civil Service Regulations. Art. 641.		Civil Service Regulations, Art. 474.		
	Amount calculated on a percentage basis.	Fixed maximum.	Amount calculated on a percentage basis.		Fixed maximum.
1	2	3	4	5	6	7
		Rs.	Rs.		Rs.	Rs.
10	$\frac{20}{60}$	2,813	1,000	$\frac{10}{60}$	1,406	2,000
11	$\frac{21}{60}$	3,150	1,400	$\frac{11}{60}$	1,650	2,200
12	$\frac{22}{60}$	3,520	1,800	$\frac{12}{60}$	1,920	2,400
13	$\frac{23}{60}$	3,910	2,200	$\frac{13}{60}$	2,210	2,600
14	$\frac{24}{60}$	4,320	2,600	$\frac{14}{60}$	2,520	2,800
15	$\frac{25}{60}$	4,750	3,000	$\frac{15}{60}$	2,850	3,000
16	$\frac{26}{60}$	5,200	3,000	$\frac{16}{60}$	3,200	3,200
17	$\frac{27}{60}$	5,670	3,000	$\frac{17}{60}$	3,570	3,400
18	$\frac{28}{60}$	6,160	3,000	$\frac{18}{60}$	3,960	3,600
19	$\frac{29}{60}$	6,670	3,000	$\frac{19}{60}$	4,370	3,800
20	$\frac{30}{60}$	7,200	4,000	$\frac{20}{60}$	4,800	4,000

It is a decided anomaly that officers of other services coming under Civil Service Regulations Article 474 and drawing the same pay as an Engineer, should, if invalided, be entitled to a higher pension after 10, 11, 12, 13, 16, 17, 18 and 19 years completed service and to a less pension after 14 or 15 years service. It is urged, therefore, that to remove the anomalies pointed out, and to make article 641 of real benefit to Civil Engineer Officers now serving in the Department that the maxima limits should be at least the same as those fixed according to Article 474. Unlike the Indian Civil Service and the Military Services in India, there is no official Family Pension Fund for the Public Works and Railway Departments. The emoluments of officers in these Departments are not sufficient to admit of their making adequate provision for their families should they die in harness. The knowledge that they are unable to make such provision is a constant source of anxiety to many officers who are entirely dependant on their salary, and whose duties constantly take them into situations, which are prejudicial to health. They have also the additional anxiety of knowing that their pensions are purely personal and cease with their death. There is a strong desire, therefore, that means may be found whereby an officer may be aided in making suitable provision against the event of his death for the members of his family dependent upon him. Pension has been officially defined as deferred remuneration, which means that a certain portion of the salary which would have been paid to an officer, had there been no pension attached to his appointment, is kept back to provide for a pension on retirement. This view is corroborated by the fact that when an officer is transferred on Foreign Service he is made to contribute towards the cost of his pension at the rate of one-sixth of the pay he would have received had he remained in the service of the Government of India. It may be presumed, it therefore, that an officer only receives six-sevenths of the pay he would have received had there, been no pension to provide for, and that one-seventh is kept back by Government as the officer's contribution towards his pension fund. If the officer had the option of investing the amount assumed to be retained by Government to provide for an annuity with a private Insurance Company, he could probably so arrange the terms, that a portion of his annuity would be assured to his widow or other member of his family dependent upon him, should his death take place within a certain number of years from the date his annuity fell due, with the additional security that his family would be covered against the risk of his death, should it take place during the time he was subscribing to his annuity, in the guarantee of a considerable sum of maney. Could some such scheme be worked out by Government on an actuarial basis a large number of officers, not only in the Public Works Department but in other services similarly unprotected, would be glad to avail themselves of it and to subscribe towards the extra cost.

There is a strong wish among the members of this Association, that there should be one set of leave and pension rules for all Civil Engineer Officers on the Imperial List, irrespective of the source from which they were recruited. Such differentiations as still exist should the Association considers be abolished.

72,161. **(VII.) Such limitations as may exist in the Employment of Non-Europeans and working of the existing system of division of Services into Imperial and Provincial.**—As regards the employment of Indians in the Imperial Branch of the Public Works and Railway Departments, the majority of the members of this Association consider that the European element must largely preponderate for a good many years to come to admit of the present standard of efficiency being maintained. The number of appointments to the Imperial Service which may at the present time be reserved for Indians is ten per cent., and this number should, it is considered, not be exceeded at present.

The Association does not feel called upon to express any views regarding the division into Imperial and Provincial Services as it is a question outside its scope, neither does the Association consider it within its province to make suggestions regarding the constitution of the Provincial Branch of the Department.

72,162. **(VIII.) Relationship of the Service to the Indian Civil Service and other Services.**—It is considered that the relationship as existing between the Public Works and Railway Departments and other Services in India is on the whole satisfactory and should remain unaltered.

72,163. **(IX.) Any other points within the Terms of Reference to the Royal Commission not covered by the preceding Heads.**—*Travelling Allowance on Transfer.*—The Association desires to bring to the notice of the Commission the inadequacy of the existing Travelling Allowance Rules in the case of Transfers. The Association is aware that the question is common to other Departments. While admitting that transfers in the interests of the Public Service must inevitably involve some expense to the officers transferred, and the practical impossibility of framing any rules suitable to all cases that will obviate it, they consider that the actual out-of-pocket expenses, especially in the case of long trans-

fers, are frequently more than an officer should be called upon to incur, and often amount to a distinct hardship. The Association believes that the question was under the consideration of the Government of India some six or seven years ago and would suggest that the question be again considered with a view to the present rules, which contain several anomalies, being made more liberal.

General Provident Fund.—Under the rules of this Fund interest on the account of a deceased depositor ceases from the date of tender of payment to the person legally entitled to receive the balance at credit of the account. It frequently happens that from inexperience in matters of the kind and other causes, it is inconvenient to draw the amount immediately on tender of payment being made. The Association therefore suggests, that it should be permissible for the balance at credit of the account to remain for a reasonable period after tender of payment has been made and to continue to draw interest during that period.

Inadequate recognition in the Honours Lists.—There has been for a very long time a growing dissatisfaction among Engineers in India with the Honours distribution, which has resulted in what is felt to be an implied public slur on the profession. It is felt that the power to confer Honours on the Public Services was entrusted to the General Administration as a means of giving public recognition to individual merit impartially to all public servants deserving such recognition, and that given impartial exercise of this power, the Honours List would be, to some extent, an index of appreciation by the Administration of services rendered by any given branch of the Service. Judged by this standard, a study of the Honours List indicates a marked lack of appreciation of services rendered by the Engineers of the Public Works and Railway Departments which is felt to be unjust. There is, so far as is known, no other country in the world, where a similar system of Public Service Honours obtains, in which the Engineering profession is held in such light esteem, as is evidenced in the Honours List in India, while, certainly in some of its aspects, the work of the Department in India stands out prominently as of a high order of merit, as has frequently been proved by the deputation of Indian Engineers to other countries as experts in their particular profession.

Although it is not definitely known to the Association what system is followed in framing the Honours Lists, it is generally believed that the results, which are the subject of dissatisfaction, are due to the fact that the recommendations are almost exclusively in the hands of the Civil Service, and that this has led to a gradually increasing tendency to restrict Honours unduly to that Branch of the Service.

It is believed that if the matter is considered worthy of notice by the Commission, an expression of opinion by them would carry much weight and lead to rectification of what is a very substantial grievance. The figures given below speak for themselves.

ANNEXURE NO. V.

Short History of the Public Works Department Pension Rules.

Prior to 1884 the Pension Rules for the Public Works Department were identical with those in force for all other services outside what was known as the Covenanted Service. These rules had their birth in 1831, when the following rules were drawn up for subordinate officers of the Civil Department, excluding sowars, jemadars, &c.

The officers were divided into two classes, *i.e.*,

(1.) Law officers and native judges, with whom were subsequently included educational officers, and

(2.) All others in superior services.

The rules were briefly as follows:—

(1.) No pension could be claimed by any officer unless incapacitated for further service by old age, protracted ill-health, or other infirmity.

(2.) Subject to this proviso a pension not exceeding one third of salary could be claimed by Class 1 after fifteen years service, and by Class 2 after twenty years service. After twenty-two years service, Class 1 could claim an increased pension not exceeding half salary; Class 2 had the same privilege after completing thirty years service.

(3.) At first there was no limit of age from which pensionable service commenced; subsequently the limit was fixed at 16.

The principal points to observe about the above rules are that there was no maximum limit of pension, and these were not retiring pensions, but could only be claimed by persons incapacitated for further service.

The result of no maximum having been fixed was that when uncovenanted officers began to obtain the higher appointments they were able to claim pension much in excess of anything contemplated by the Court of Directors, and consequently in 1855 a rule was introduced limiting the pensions to £500 per annum for uncovenanted officers "hereafter appointed to the service." In some cases the pension sanctioned under the old rules had been as much as £900.

In 1862 the Bombay Government proposed that every officer appointed before 1855 should, on promotion to a salary of Rs. 10,000 per annum or upwards be called upon to renounce his claim to a pension of more than £500 a year. With this however the Government of India did not altogether agree, and in submitting the proposals to the Secretary of State pointed out, that the original rules which had been framed chiefly in reference to natives of India, among whom it is probable that no salary higher than Rs. 500 or Rs. 600 per mensem would have been found, merely fixed a maximum which was not to be exceeded; and that while the Government would be quite justified in framing new pension rules which would be applicable to all classes of appointments, it was a somewhat doubtful proceeding to refuse promotion to a deserving officer unless he would consent to abandon that to which it was assumed he had a right under the existing rules. In reply the Secretary of State considered, that when the rules were framed a larger pension than £500 could never have been contemplated, and laid down that the full pension should not be given as a matter of course, but only awarded in case of extraordinary merit.

This correspondence led up to the Revised rules of 1864, applicable to the whole of the uncovenanted services of India. These may be briefly summarized as follows:—

(1.) An officer, on production of a medical certificate of unfitness for further service in India, could claim—(*a*) If under 15 years service, a gratuity not exceeding 12 months' pay; (*b*) after 15 years' service, one third of salary, subject to maximum of Rs. 3,000 and 2,000 according as the salary was above or below 1,000 a month; and (*c*) after 25 years, one half of salary, subject to a maximum of Rs. 5,000 and Rs. 4,000, according as the salary was above or below Rs. 1,000 a month.

(2.) After 30 years' service a retiring pension (*i.e.* without medical certificate) of one-half of salary subject to the maximum limit of Rs. 5,000 and Rs. 4,000 could be claimed as the reward of 30 years' faithful and efficient service.

The limit of age from which pensionable service counted was raised from 16 to 22 and it was ruled that privilege leave in India was the only leave which could be counted towards pension. At the same time provision was made for the payment of pensions through the Home Treasury.

In 1855 a few English trained Civil Engineers with some practical experience had been sent out for the first time by the Court of Directors, and with reference to these the Hon'ble the President in Council was pleased to resolve that "such of the uncovenanted servants of the Public Works Department as receive above Rs. 10 a month of salary, should be entitled to a superannuation pension under the provision of the Pension Rules of the 4th January 1831, but that in no case should a larger pension that £500 or Rs. 5,000 per annum be granted to uncovenanted servants receiving salaries above Rs. 1,000 per mensem whether the retirement may be from ill-health (after either 20 or 30 years' service), or without a medical certificate after 35 years' service."

The regular appointment of Civil Engineers from home in large numbers was only commenced by Lord Stanley in 1859, after the Mutiny, when the administration of the country had been taken over by the Crown.

The position of these men as regards the general pension rules was defined in Despatch No. 84, dated 31st March 1865, when the Secretary of State ruled that "Civil Engineers who entered into covenants when the old uncovenanted Leave and Pension Rules were in force" might be allowed "the benefit of those rules in regard both to leave of absence and pension, and any covenanted Engineer so situated may have the option of selecting which rules he will abide by, but having once made his selection he is not to be permitted to avail himself of any of the advantages of the other rules."

This concession to Covenanted Civil Engineers and certain Civil Covenanted Officers of the Telegraph Department who entered the service before 1864 was finally summarised in Financial Department Resolution No. 1555,* dated 1st July 1870, where it is stated

---

* (1) Officers entering the service before 1855.
(2) Convenanted Civil Engineers in the Public Works Department and certain Civil Covenanted Officers of the Telegraph Department who entered the service before the promulgation of the new rules, and have elected to abide by the Pension Rules.
(3) Native judges who were in the service on 26th October 1866.

that "limitation prescribed by the Uncovenanted Service Pension Rules of April 1864 in regard to the third and one-half pensions do not apply to the uncovenanted servants of the three cases noted in the margin. Ordinarily the limit of pension for these classes of servants will be £500 per annum.

All Civil Engineers appointed subsequently to 1864 came under the new rules promulgated in that year for the uncovenanted service generally, but in 1869 the disadvantageous position in which they were placed as compared with their Royal Engineer confrères doing exactly the same work in the Department, was recognised by the Government of India; and in Circular No. 84 P. W., dated 6th October 1869, referring to the position of the Civil Engineers it was stated that "the Government of India has lately had before it proposals which it is hoped will take early effect, for improving their position generally, and placing them in respect of their emoluments on precisely the same footing as all other officers employed on the same duties."

The Government of India proposals were more clearly defined in their Despatch of 28th March 1870, to the Secretary of State, an extract from which reads as follows:—

"We may remark that we have already recommended the equalisation of the pay of the Military and Civil branches of the Department, and we are gratified to find this proof that Her Majesty's Government are likely to receive that proposal favourably. On this point we only add, that we shall be glad to see some plan adopted by which the furlough allowances of Civil Engineers shall be equalised with those of Military Officers in the Public Works Department, and so far as practicable their advantages of pension also."

Government machinery moves slowly, and matters seem to have remained at this stage till 1883, when Lord Kimberley, then Secretary of State for India, announced in a despatch that the Public Works Department Officers were no longer to remain under the general uncovenanted service rules, but that a special chapter was to be introduced into the pension code to meet their case. Accordingly in 1884, what are known as the more favourable pension rules came into force and the following privileges were accorded to English trained Engineers and Telegraph Officers:—

(1) The right of claiming a pension up to Rs. 4,000 on completing 20 years' services and up to Rs. 5,000 on the completion of 25 years' service (the pension is reckoned at 1s. 9d. to the rupee).

(2) Additional pensions of Rs. 1,000 and 2,000 over the above maximum limit for three years' service as Superintending and Chief Engineer respectively.

(3) The right of counting the following periods of furlough as pensionable service (Civil Service Regulation 408):—

2	years	in	20	years'	service
3	,,	,,	25	,,	,,
4	,,	,,	30	,,	,,
5	,,	,,	35	,,	,,

(4) The right of adding a period not exceeding three years to their pensionable service on account of previous experience in their profession. The regulation regarding the counting of previous professional experience towards pension is no longer in force.

After having been in existence for 14 years, the Chief Engineer and Superintending Engineer special pensions were abolished in 1898. Officers however who have shown special energy and efficiency during an effective service of three years as Chief Engineer, or first grade Superintending Engineer, may, at the discretion of the Government of India, be allowed an additional pension of Rs. 1,000 a year, subject in the case of entrants to Government Service after 31st December 1909, to the condition that the officer must not retire voluntarily before the completion of a total qualifying service of 28 years (Civil Service Regulation 643).

The actual pension earned is still regulated by the maximum fixed in 1864, and compares very unfavourably with what is nominally earned on the percentage basis.

Pension has been officially defined as an officer's deferred remuneration, and hence should bear a definite relation to the amount of salary. It is obviously due either to the officer himself as a provision for his old age on retirement, or else to those dependent on him in the event of his dying in harness. In the case of an officer going on foreign service all contributions made towards that officer's pension are calculated on a percentage of salary basis and consequently the logical way of calculating the pension itself would seem to be on the same basis. At present the great drop of income on superannuation in the case of an officer who has devoted the best years of his life, to the service of India, necessitates on retirement an almost complete severance from his former life, inasmuch as, in order to live on his reduced income he has to set up house in a humbler way among more humble surroundings. This is obviously a hardship, and almost inevitably forces a married officer with children to educate and start in life to again seek employment, either at home or outside the Department in India, at an age when, owing to the unfavourable conditions under which he has worked in India, he is no longer considered by Government as fit for duty. On superannuation under such circumstances an officer is entitled to a sufficient superannuation allowance to enable him to live in honourable retirement in approximately the same state as he has been encouraged to live during his 25 or 30 years in India, and not to be forced, in premature old age, to dispense with any little luxuries to which he may have been accustomed.

Amount of Pension.—The amount of the pension was limited to a maximum of Rs. 5,000 in the 1864 rules and though this has never been specifically declared to be the equivalent of £500, such was obviously the intention at the time, and this was the equivalent paid in England under the rules till the official rate of exchange began to drop in the early seventies. This £500 payable in England was on exactly the same footing as the £1,000 payable to the covenanted service, and it is very evident that this limit was fixed as the moiety of the pension of the covenanted service which the Government at the time undertook to contribute.

In 1870 the Presidency Annuity Funds were abolished, and Government undertook to provide every Civil Servant who had completed 25 years' service, of which 21 had been spent in India, with an annuity of £1,000 payable in England. Towards this the officer was to continue to contribute throughout his service 4 per cent. of his salary.

Previous to 1862, a Civilian, in the event of his subscription falling short of what would cover his own moiety of his annuity, had to pay up the balance in a lump sum, on retirement, but in 1862, the Secretary of State decided that the Government should be assumed to provide £600 as its share, and that at least the balance should be provided by the annuitant from his subscriptions to the fund. This however only benefited those who had not contributed largely to the funds.

It is difficult to say how much a Civilian at the present actually contributes towards his annuity, but actuarial calculations made by the European Civil Service Association in reply to a speech made by Sir J. Gorst in the House of Commons in 1889, brought out the fact that with the rupee at 1s. 4d. a civilian on the average contributes at the rate of 4 per cent. of his salary, only sufficient for an annuity of £300 on retirement, leaving Government to make up the remaining £700.

This is also the amount of the pension ordinarily granted by Government in the case of the Indian Army, the I. M. S. and the R. E. Officer subject to the Civil Rules, and it is on this basis that the Imperial Engineer, with his equally expensive training asserts his right to a £700 pension after 30 years' service.

As matters now stand it would often pay an able man to retire on completing twenty years' service when he would be entitled to a Rs. 4,000 pension. Such a man would be at his prime and would probably not have much difficulty in finding suitable remunerative employment elsewhere. By judiciously investing his pension, in ten years he would have accumulated half a lakh, and this amount at 4 per cent. would

provide an additional income of £175 in perpetuity, while he would be under no obligation of retiring on his fifty-fifth birthday. If the money were invested in an annuity it would supplement the pension to a figure far beyond what the officer would have received on superannuation had he remained in Government Service until compelled to retire under the fifty-five year rule.

MR. W. S. DORMAN called and examined.

72,164. (*Chairman.*) The witness represented the Civil Engineers' Association, which numbered 560 members drawn from all Provinces in India, and which included 48 Indians out of 65 in the Imperial Service. The Association was confined to men in the Imperial branch of the service and those who have retired.

72,165. The members of the Association were practically unanimous in considering that the training should be at a college on the lines of Cooper's Hill as it would be of advantage to the service in fostering *esprit de corps*, but they recognised that there would be difficulties in the way of re-establishing such a college.

72,166. He could not say what the views of the members would be with regard to a competitive examination coupled with nomination in substitution for the present system of selection by the Secretary of State. That was the system in force prior to the formation of Cooper's Hill, and recently he had come across a note recorded by the Institution of Civil Engineers in 1871 in which they pointed out that the system in force prior to the formation of Cooper's Hill was bound to lead to disappointment as it in no way tested any of the qualifications of an engineer except a retentive memory and a certain aptitude for figures, and the Institution appeared to think that competition was bound to fail.

72,167. The present age at which recruits joined the service, was satisfactory; whether they should join earlier was a matter of opinion.

72,168. The best qualifying test for a candidate who submitted himself for selection would be one of the University Degrees recognised by the Institution of Civil Engineers as exempting from their own examination. He thought the approved Universities included all the representative colleges in England as well as the McGill University in Montreal, the University of New Zealand and the Sydney University.

72,169. The balance of opinion in the Association was in favour of a year's practical training in England. If opportunities were offered, however, in the shape of big operations in India there were advantages in a training in India. Personally he believed that some elasticity should be allowed so that when large operations were going on in India a recruit might be sent out at once.

72,170. With reference to the division of the service into Imperial and Provincial branches, the Association had decided that this question was outside their scope and that any opinions upon it might be left to individual members. There was undoubtedly a certain amount of discontent with the present system, and that discontent must naturally react injuriously upon the service. The Association had not considered whether the discontent would be removed by the abolition of the invidious distinctions in regard to service, title, etc., but personally he believed the removal of those distinctions would largely tend to remove the discontent.

72,171. The mandatory rule that 10 per cent. of the vacancies in the Imperial Service should be reserved for Indians ought to be abolished. If the 10 per cent. was retained the field should be made wider so that when an eligible candidate was not to be found in England he could be drawn from India.

72,172. He thought a central college in India would have many advantages but did not know sufficient about the present colleges to offer any useful criticisms.

72,173. Engineers in the Public Works Department were not against a period of probation, but feared that candidates might not come forward if a probationary period was established. There was nothing undesirable about it. Personally he did not think it would be difficult to obtain recruits on probation. In the interests of the service it would be a good thing to be able to get rid of an unsuitable man and it would also be of benefit to the probationer if he were sent away as early as possible in his career.

72,174. With regard to the appointment of Royal Engineers being so made as not to impair the prospects of civil engineers of the same standing, the Association did not mean that when brought in they should be placed at the bottom of the list for purposes of seniority. At present a Royal Engineer coming into the department counted for promotion in the department as though his service began two and a half years after the date of his first commission. That rule was introduced in order to put Royal Engineer Officers on a level with Cooper's Hill men of the same age. Now that men being recruited from the open market were on the average older than the Cooper's Hill men that period of two and a half years might have to be modified in future so as to keep the two classes on an equality. The average age of Cooper's Hill men was about twenty-two, while the average now was twenty-three to twenty-four. If civilians could be recruited at twenty-two, the two and a half years would still be fair to the Royal Engineer. Provided there was equality of age he had no objection to a Royal Engineer being brought into the Department somewhere above the bottom of the list. Hardship occurred at times, however, for instance, in his own Province two men came out from Cooper's Hill in the same year and two Royal Engineers from the same Chatham batch subsequently entered the department, one some time ago, and one recently with the rank of an Executive Engineer; they had gone into the same year as the Cooper's Hill men, but it happened that their seniority counted about a fortnight earlier than the two Cooper's Hill men, and other things being equal the latter would suffer in the long run when it came to promotion to the administrative grades.

72,175. The Association laid the greatest emphasis on improved pension and leave allowance. If an increase were made in the amount of pension the officers would be content with the present scale of salaries. If improvements in the pension were made conditional on the abolition of the twenty years retiring pension the junior men would probably raise an outcry. The concessions of optional retirement after twenty years had not been taken advantage of to a large extent, but men in the department looked forward to the possibility of being able to retire after that length of service. It was only when a serious block was impending that the privilege was likely to be taken advantage of to any great extent. It did not do any harm and Government did not suffer. The officers did not ask for any improvement in the pension paid after twenty years as there was no desire to encourage early retirements but they wanted some improvement in the pension paid for more than twenty years' service. Personally he believed if the pension was improved the abolition of the twenty years' period would be a reasonable condition.

72,176. The service very much desired a family pension fund to be established, guaranteed and subsidised by Government. The officers were quite prepared to contribute and would accept the fund if it had a Government guarantee behind it.

72,177. Officers were deterred from taking leave because they could not afford it. It was practically impossible for a married officer to save anything out of his salary beyond his Provident fund contributions; and the leave allowance of a junior officer was very inadequate.

72,178. There was some feeling in the service with regard to the Honours List, but it was not a point upon which much emphasis was laid.

72,179. (*Sir Murray Hammick.*) The Crystal Palace School of Engineering was not one of the recognised colleges on the list of the Institution of Civil Engineers. Many Indians went to the school, but personally he had not much confidence in it.

72,180. (*Sir Valentine Chirol.*) Bringing out trained engineers on a terminal contract for five years would not meet the requirements of the department. The men brought out would be much older than the men who came out on probation and would not be suitable men to bring in at the bottom of the cadre. If

young men were brought out they would have no experience, and the five years' service would practically be a probationary period. He himself had come out at the age of twenty-four on a five years' covenant and was brought on to the permanent cadre at the end of the term with the loss of one year's service in reckoning for seniority in the Department.

72,181. (*Mr. Abdur Rahim.*) He would not fix a maximum of Indians for the Imperial Service but would confine that service to officers recruited in in England.

72,182. The question of paying indigenous labour the same rates as imported labour was an economical one for the Government to consider. The Association had not put forward any suggestions on the subject. Personally he believed that a man working in his own country should not be paid the same as a man who came in from abroad. It was necessary to offer sufficient terms to attract men to India, but whether those terms should be higher than those paid to Indians was a matter for the Government to settle. If a man came out on a certain contract, and understood the terms of the contract, he had no reason to grumble so long as the contract was fulfilled. He did not think the terms offered to Imperial officers at present would continue to attract the right stamp of men in the future. The past history of the department showed that Government had gradually to offer better terms in order to obtain the class of men they wanted. For example in the early history of Cooper's Hill it was found that the terms were not quite so good as they appeared from the college prospectus and on protest being made to the Secretary of State the pay was revised.

72,183. The abolition of the distinction of Imperial and Provincial would go a great way to remove the existing discontent, but the difference of pay was also a grievance. Personally he did not think the local recruit ought to expect the same pay as the recruit from England, but he had not discussed the matter with men in the Provincial Service and the Association had not taken up the question.

72,184. (*Mr. Madge.*) There was no recognised system in England by which men could obtain a practical training; they obtained it where they could. A great deal depended on the place and the officers under whom the candidate was trained and possibly that accounted to a large extent for the difference of opinion as to the value of a training in India or a training in England.

72,185. The general opinion of the men in the Imperial Service was that the Provincial Service men were not up to the same standard as the Imperial Service, but it was difficult to prove anything from actual facts.

72,186. It was felt by the Association that it would be advisable that Royal Engineers should join the department early in their service. The Royal Engineer came into the Public Works Department because he received improved pay, and he did not think it would be fair to the Royal Engineer to bring him in at a time when his pay corresponded to the pay of the lowest grade in the Public Works Department.*

72,187. A five year contract system was not practicable as a recruiting base for the department. Old experienced men would not be amenable to the rules of the department, and would probably cause discontent. Another objection was that the men would come in on higher pay.

72,188. (*Mr. Fisher.*) At present officers could not obtain study leave, but a man of less than 12 years' service could obtain permission when on furlough to inspect definite works, about which he had to submit a note, and if that note was considered satisfactory his railway fare was paid. That was quite inadequate. The Association felt there ought to be something on the lines of the facilities offered to the Indian Medical Service.

72,189. (*Mr. Sly.*) The fifty-five years' rule for retirement was originally introduced to accelerate promotion in the department when there was a block. Now another block seemed inevitable but apart from this there were no special conditions in the Public Works Department which made it necessary that the rule should be retained.

72,190. According to the present prospectus sent to candidates a man had a reasonable expectation of reaching the executive grade after a certain period of service, and if he failed to do so through no fault of his own the fault must lie with erratic recruitment on the part of the Government. It was true there was a specific statement in a footnote that an officer would not rise above Rs. 800, in the ordinary course, but that required to be made much more clear, because read in conjunction with the paragraph in the prospectus itself the meaning was open to doubt.

72,191. The Association felt that the expense of living of a Public Works officer was just as heavy as that of an Indian Civil Service officer, and also that the Public Works officer's education was equally expensive. The better pay of the Indian Civil Service and the plums in that service were necessary to attract the best brains to the premier service and to enable the officers to keep up their position in India but taking everything into consideration officers of the Public Works Department were entitled on retirement to an equal pension in so far as this was contributed by Government.

72,192. The claims put forward in the written statement in regard to privilege leave involved an alteration of the principle on which privilege leave was granted, but at the same time there was the question of whether a man who had earned his privilege leave was not entitled to it. He himself at present was entitled to three months' privilege leave but saw no chance of getting it. The suggestion put forward by the Association provided an economical remedy as against the more logical method of an increased cadre. The claim for the allowance of privilege leave prior to retirement was also, he admitted, opposed to the principle on which privilege leave was granted.

72,193. If a family pension fund was established there would not be the same need for the provident fund as at present.

72,194. The question of private practice on the part of officers had never come prominently before the Association, but it was felt that during leave it would be advantageous to allow an officer to take private practice, not with the idea of his making any considerable profit, but with the idea of his obtaining experience in English methods. Private practice during service in India was negligible.

72,195. (*Mr. Chaubal.*) 75 per cent. of the Indians in the Imperial Service were members of the Association, and presumably the memorandum had been seen by them, as a copy was supposed to have been sent to every member. He could not say whether it had been approved by the Indian members, but it had been given to him as the official memorandum of the Association. The memorandum was drawn up by a committee formed of officers stationed in Simla but no Indian member was on the committee. No general meeting was called, as it was impossible to have a meeting of such a large number of members from all over India.

72,196. (*Sir Theodore Morison.*) He did not think there had been any reduction of maximum invalid

* The witness afterwards wrote: "I find my reply was not quite accurate and the following comparative table which has been prepared by Captain Holme, R.E., Under Secretary, Buildings and Roads, Punjab, may be of use.

The last column gives the pay (including exchange compensation allowance) of a Royal Engineer officer in the Military Works Service, while the previous column gives the corresponding pay in the Public Works Department.

The starting pay shewn for the Military Works Service is the pay drawn 2½ years after the date of first commission. The pay is shewn in rupees per mensum:—

Service in P. W. D.	P. W. D.	M. W. S.
1st year	384	442
2nd „	420	442
3rd „	460	442
4th „	500	442
5th „	540	$\frac{442 + 548}{2} = 495$
6th „	580	548
7th „	620	548
8th „	660	548
9th „	700	$\frac{548 + 780}{2} = 662$
10th „	750	780
11th „	800	780"

pension and the statements in the memorandum on this point required some modification. His own impression was that subsequent to the introduction of the chapter in the pension code to which Civil Service Regulations 641 now corresponded the paragraph (now Civil Service Regulation 474) regarding the allowances of the other uncovenanted services had been revised. The relative figures given in the memorandum were, however, correct. The complaint really was that the regulation fixing the maximum pensions of the uncovenanted services had been revised (*vide* Finance Department order No. 414, dated 25th January, 1888), and no corresponding revision had been made at the same time in the invalid pension rules of the Imperial Engineers, though it had been ruled that the latter were entitled to special treatment, and better pension rules than those governing the services formerly classed as uncovenanted.

(The witness withdrew.)

At Madras, Wednesday, 28th January, 1914.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

THE EARL OF RONALDSHAY, M.P.
SIR MURRAY HAMMICK, K.C.S.I., C.I.E.
SIR THEODORE MORISON, K.C.I.E.
SIR VALENTINE CHIROL.
MAHADEV BHASKAR CHAUBAL, ESQ., C.S.I.
ABDUR RAHIM, ESQ.
WALTER CULLEY MADGE, ESQ., C.I.E.
FRANK GEORGE SLY, ESQ., C.S.I.
HERBERT ALBERT LAURENS FISHER, ESQ.

And the following Assistant Commissioners:—

S. D. PEARS, ESQ., Acting Secretary to Government, Public Works Department, Madras.
S. BHASKARA AYYAR, ESQ., Executive Engineer, Madras.

R. R. SCOTT, ESQ. (*Joint Secretary*).

COLONEL W. M. ELLIS, R.E., Chief Engineer, Madras.

Written Statement relating to the Public Works Department.

72,197. **(I.) Methods of recruitment.**

IMPERIAL SERVICE.

Present Regulations.—This service is recruited from selected candidates appointed in England by the Secretary of State for India in Council. The selection of candidates in England is made on the advice of a Selection Committee including at least one eminent representative of the Engineering profession. Natives of India who are British subjects are eligible for appointments to this service and are selected to the extent of 10 per cent. of the total number of Assistant Engineers thus recruited, if otherwise duly qualified, viz., by age, examination, &c.

Remarks. — Generally the method of selecting the Imperial Engineers is satisfactory. It is considered that one member of the committee should be an Engineer who has served in India as a Chief Engineer in the Public Works Department.

One member of the committee should be a retired member of the Indian Civil Service.

It is also considered that the 10 per cent. proportion of Indians who are now selected in England by the committee should be selected in India by the Local Government and that the field of selection should include all qualified men up to the age of 30 years and embrace men already serving in the Provincial or Subordinate establishment. It is believed that by such a system more efficient Engineers could be secured.

In regard to the matter of appointment of Indian Engineers it is believed that the locally-bred and trained men are likely to be more efficient than men belonging to other provinces or trained in England. Generally speaking, local men are likely to be professionally and administratively the equals of Indians appointed in England, while they have the advantages of being in close touch with the language, customs and mode of life of the local Indian population. This is frequently not the case with the Indian appointed in England. I am of opinion, speaking generally and as regards average, that the Indian Engineer is inferior to English Engineers, i.e., in ability to apply in practice his theoretical knowledge and training and in practical self-reliance and resource and energy.

If a local man, he, however, possesses the advantage of closer touch and knowledge of the people and this is frequently a considerable asset. In the case of the Indian appointed in England, this advantage is frequently lost, while the disadvantages remain. I am of opinion that the best method of appointing Indians to the Imperial Service is by the selection periodically from among the Provincial Service Engineers for transfer to the more highly-paid service, and not by direct appointment either in England or in India.

PROVINCIAL SERVICE.

Present Regulations.—This service is recruited—
(1) From the students of the College of Engineering, Madras, being natives of India as defined in the Statute 33 Vict., Chapter 3, Section 6, at the rate of one every year, and

(2) From the Upper Subordinates of the Department at the rate of one in alternate years. The recruitment for the College is made annually by the Chief Engineer, Public Works Department, in consultation with the Principal of the College and the appointment is conferred on the student, either Civil or Mechanical Engineer, judged most suitable on the results of the examination and the promises shown by him and his general behaviour during the College course.

Remarks.—It would be an advantage if the selection of an Engineer direct from the College of Engineering, Madras, for appointment to the Public Works Department could be improved on. It is by no means a foregone conclusion that the man who is top of the year will prove the most efficient practical Engineer.

It is considered reasonable to guarantee the number of appointments to Indian Engineering graduates, but the selection under existing conditions in practice is confined to two—the first Civil and first Mechanical Engineer student in order of passing out from the College. It has been suggested that selection from among the passed Engineers after two years' service in the Department as Section and Sub-Division Officer would result in getting the best men with much more certainty than the present method. Such a system is, however, open to the objection that it entails employment of several inexperienced men in positions of responsibility with a view of seeing which was best suited for such a position. From this both Government work and the interest of the unsuccessful men are likely to suffer. This objection is so grave a one as to render the suggested reform of doubtful value. In the interests of Government more efficient men would be obtained by giving the yearly post now given yearly to a selected passed Engineer student from the College to any passed Engineer graduate of the Madras College under the age of, say, 30 years. This would secure a wider field for selection among proved and tried men, but would naturally be unpopular with College students.

The system of recruitment of the Provincial Service from Upper Subordinates of the Department is quite satisfactory.

72,198. **(II.) Systems of training and probation.**

Imperial Service.

Present Regulations.—Candidates who had passed through a College course and obtained one of the degrees prescribed should have had at least one year's practical experience in Civil Engineering under a qualified Civil Engineer at the time when they appear before a Selection Committee. Those who have taken no College course should have had a full three years of such practical experience. In the event of any candidate being selected who has not, in the opinion of the Selection Committee, had sufficient practical experience, he may be required to undergo, after arrival in India, a year's probation in charge of works and his final appointment is made dependent upon the result of such probation.

Remarks.—It is considered that both Imperial Engineers appointed in England and Provincial Engineers appointed direct from the Madras College of Engineering should be on probation for a period of two years after appointment. The apprentice period of one year for Provincial Engineers to be in addition to this. This may be considered as taking the place of the practical training required of English-appointed men before appointment. In cases of doubt, extension of the period of probation by not more than one year should be permissible. At the end of the period of probation the engagement should be terminable by either party. The termination of either party of the engagement should, in the case of Engineers appointed in England, carry with it title to a free passage to England.

Provincial Service.

Present Regulations.—Students recruited from the College of Engineering, Madras, are appointed by the Local Government as apprentices on Rs. 100 a month. They are promoted to Rs. 150 after six months' period, provided they have given satisfaction during that period and to Assistant Engineer on Rs. 250, Provincial Service, after a year provided they are then considered to be in all respects competent to hold charge of a sub-division. In the case of an apprentice who at the end of the first year's service is not considered qualified for confirmation in the department, the Local Government may decide whether he is to be given a further trial or be removed from the Department; and ordinarily one who is not within three years from date of appointment as apprentice Engineer recommended for promotion to Assistant Engineer will be so removed.

72,199. **(III.) Conditions of service.**

Present Regulations.—Under Article 649, Civil Service Regulations, any Civil Engineer of the Public Works Department who, on reaching the age of 50 years, has not attained the rank of Superintending Engineer will be liable to be called upon to retire.

Under Article 650 of the Civil Service Regulations, all Civil Engineers of the Public Works Department are required to retire on attaining the age of 55 years.

The same rules apply to Military officers also—*vide* Articles 615 and 616, Civil Service Regulations.

This heading is too vague to give any more information on the subject.

Remarks.—The alteration suggested in the way of extended probationary period on first appointment has already been made. It is, however, too much to expect that such an extended period of probation will have the effect of excluding inefficients from the department and under the existing conditions of service the matter of getting rid of an inefficient officer either Imperial or Provincial is one involving great difficulties.

This is especially so when the period served is such as not to entitle the officer to a pension. In every department there are a few inefficients in the position of superior officers and the Public Works Department is no exception. There are Assistant Engineers who are considered unfit for executive charges of divisions and who it may be added are bad Sub-Division Officers as well.

It is open to Government to reduce such servants or refuse to promote them, but this does not meet the case—reduction or non-promotion will not produce efficient work and is indeed likely to result in still more inefficient performance of duties on the part of a man who has lost all prospect of advancement. It is obviously in the interests of Government to dispense with the services of men who prove unprofitable public servants, while in the case of the junior men, in such a case, it is probably also in the interests of the men themselves. Under existing circumstances, in the absence of gross misconduct or default, there is no regular method of getting rid of an inefficient. It is essential that an officer of the Public Works Department who is considered unfit for charge of an executive division after sufficient service as Assistant Engineer in charge of sub-divisions (say six years) should be got rid of.

It is desirable that Government should treat with generosity men whose services are dispensed with for general inefficiency; in some cases the fault does not lie with want of effort on the part of men themselves, and indeed while the most deserving, these are the most hopeless cases of all. It is to be considered that in unwittingly appointing such men there has been an error of judgment on the part of the appointing authority and such things must be paid for. It is recommended, therefore, that special powers to compulsorily dispense with the services of all officers at suitable notice (say one year) for general inefficiency as shown by their record of service be a part of the "conditions of service" but that officers whose services are so compulsorily terminated be given double gratuities if dispensed with before a pension is earned or in the case of pensions some increase to pension where the services are dispensed with at less service than 20 years.

No increases are to be allowed in the case of an officer whose services are dispensed with on account of specific gross fault.

There may be some difference of opinion as regards the giving special extra gratuities to special inefficient officers, but there can be little doubt as to the desirability of holding the power to get rid of a useless man and the necessity for this is pressed on the attention of the Royal Commission.

72,200. **(IV.) Conditions of salary.**

The rates of pay and allowances in force in 1890 and 1900 and at the present time are:—

Imperial Service.

—	Rates of pay.		At the present time.
	In 1890.	In 1900.	
Chief Engineers—	Rs.	Rs.	Rs.
First class... ...	2,500	2,500	2,750
Second „	2,000	2,000	2,500
Third „	1,800	1,800	Abolished.
Superintending Engineers—			
First class... ...	1,600	1,600	2,000
Second „	1,350	1,350	1,750
Third „	1,100	1,100	1,500
Executive Engineers—			
First grade ..	950	1,000	Rs. 800—50—1,250, the increment of Rs. 50 being given annually for approved service.
Second „ ...	800	850	
Third „ ...	700	700	
Fourth „ ...	600	Abolished.	
Assistant Engineers—			Rs. 380—30—700—50—750, the increment of Rs. 40 being given annually for approved service until Rs. 700 is reached, the next increment being Rs. 50 a month.
First grade ...	500	550	
Second „ ...	*350	450	
Third „ ...	250	350	

* Assistant Engineers, second grade, after three years' service in the grade, received Rs. 400 a month if recommended.

Remarks.—While as regards salary generally for both services it is considered that officers are adequately paid, there is as regards Madras an exception in the case of the Chief Engineers' grade and this is especially so when one has regard to the scale of pay of the Superintending and Executive Engineer officers.

The Chief Engineers of the Madras Public Works Department are put to considerable extra expense in moving with the Government and upkeep of houses both at Madras and Ootacamund which the position they occupy entails on them and especially on the officer who is head of the Department considerable unavoidable extra expenditure.

The responsibilities of the posts are great—much greater than those of Superintending Engineers—while the actual work is more arduous and more harassing. This is more specially so as regards the head of the department who has the dealing with all establishment questions in addition to his administrative professional duties. This officer draws Rs. 250 a month more than the second-class Chief Engineer, but his extra responsibilites and work are much more onerous and the difference of salary an altogether inadequate recognition of these.

Provincial Service.

—	Rates of pay.		At the present time.
	In 1890.	In 1900.	
Chief Engineers—		Rs.	Rs.
First class ...		2,500	2,750

Third „ ...	two separate	1,800	Abolished.
Superintending Engineers—	services—Imperial and Pro-		
First class ...	vincial—in	1,050	1,600
Second „ ...	1890. The En-	900	1,400
Third „ ...	gineers ap-	750	1,200
Executive Engineers—	pointed in England and in India were borne on the same list and were drawing the same rate of pay which is shown under Imperial Service for 1890.		Rs. 535—35—850,* the increment of Rs. 35 a month being granted annually for approved service.
First grade ..		650	
Second „ ...		550	
Third „ ...		475	
Fourth „ ...		Abolished.	
Assistant Engineers—			Rs. 250—25—675, the increment of Rs. 25 a month being granted annually for approved service.
First grade ...		400	
Second „ ...		350	
Third „ ...		250	

* A special increment of Rs. 50 may be granted by the Local Government to a deserving Executive Engineer who after completion of five years' service on the maximum pay of Rs. 850, is not promoted to administrative rank.

Remarks.—The salaries of the Provincial Service are considered adequate and suitable.

72,201. **(V.) Conditions of leave.**

Imperial Service.

Present Regulations.—The following is a summary of the principal regulations to the leave admissible to Engineers appointed to the Imperial Service by the Secretary of State from the United Kingdom:—

Short leave.—Privilege leave may be granted to the extent of one-eleventh part of the time that an officer has been on duty without interruption; and it may be accumulated up to three months, earned by 33 months' duty. During privilege leave the officer retains a lien on his appointment and receives an allowance equal to the salary which he would receive if he were on duty in the appointment on which he has a lien. An interval of six months must elapse between two periods of absence on privilege leave.

Privilege leave may be prefixed to furlough, special leave or extraordinary leave without allowance. The whole period of leave thus taken in combination is known as combined leave. Combined leave cannot be granted for a shorter period than six months, nor, except on medical certificate, may be extended beyond two years.

Extraordinary leave without allowances may be granted in case of necessity and, except in certain specified cases, only when no other kind of leave is by rule admissible. It may be granted in continuation of other leave.

Subsidiary leave in India for a minimum of ten days, usually with half average salary, may be granted to an officer proceeding on or returning from leave out of India or on retirement, to enable him to reach the port of embarkation or to re-join his appointment. It is admissible only at the end and not at the beginning of combined leave.

Short leave is also granted to enable officers to appear at examinations, etc.

Long leave.—Furlough and special leave with allowances are admissible to an aggregate maximum amount of six years during an officer's service. The amount of furlough "earned" is one-quarter of an officer's active service and the amount "due" is that amount *less* any enjoyed.

Furlough without medical certificate can, if due, be generally taken after eight years' active service and again after intervals of not less than three years' continuous service. It is limited to two years at a time. After return from privilege leave of more than six weeks, furlough cannot be taken for 18 months.

Furlough on medical certificate may be granted (*a*) to an officer who has rendered three years' continuous service for not more than two years but capable of extension up to three years and (*b*) to an officer who has not rendered three years' continuous service up to one year in any case, and up to such longer period, if any (but not exceeding two years), as the officer may have furlough due to him.

The *allowances* admissible during furlough are—

(1) During the first two years of furlough without medical certificate and during so much of furlough with medical certificate as may be "due," half average salary subject to certain maximum limits.

(2) After the expiration of the period for which the foregoing allowances are admissible, one-quarter of average salary subject to certain maximum and minimum limits.

Special leave may be granted at any time for not more than six months with intervals of six years' service; allowances calculated as during furlough are given during the first six months only whether taken in one or more instalments.

General rules.—Leave of absence, whether on furlough or on privilege leave, can never be claimed as of right, and is given or refused at the discretion of Government.

After five years' continuous absence from India an officer is considered to be out of the employment of Government.

When leave allowances other than privilege leave pay are paid at the Home Treasury, or in a Colony where the standard of currency is gold, rupees are converted into sterling at the rate of exchange fixed for the time being for the adjustment of financial

transactions between the Imperial and Indian Treasuries unless any other rate has been exceptionally authorized. But for the present the rate of conversion is subject to a minimum of 1*s.* 6*d.* to the rupee. [Privilege leave pay when issued from the Home Treasury (this is only admissible when privilege leave is combined with other leave) is converted at 1*s.* 4*d.* to the rupee.]

Remarks.—It is considered that the leave rules are too complicated and require revision. It appears unnecessary to restrict the amount of privilege leave accumulated to three months, and this specially operates as a hardship in the case of officers whose services cannot, in the interests of the public service, be spared and who continue to serve without leave after they have earned three months' privilege leave.

It is frequently the case that officers, especially married officers, with families to educate in England, cannot afford to take furlough entailing as it does half salary, and it is recommended that officers should be allowed to take furlough on full pay, the same being counted against them as if double the period on half pay. This should be subject to a proviso that not more than two-thirds of the total furlough at credit of an officer should be taken on full pay and further the total period on full pay in any one absence might be limited to one year.

The limit requiring active service for eight years before being eligible for the first furlough should be reduced to five years.

Provincial Service.

Present Regulations.—The *privilege leave* rules are the same as those for Imperial officers.

The *long leave* rules applicable to Provincial officers are those given in Chapter XIV of the Civil Service Regulations. Briefly these are:—

Leave on medical certificate may be granted for three years in all but not for more than two years at one time, and no officer can have leave on medical certificate out of India more than twice.

After six years' service, *leave on private affairs* for six months may be granted to an officer who has not had furlough and reported after intervals of six years:—

(*a*) After ten years' service, furlough for one year or any less period; and thereafter, at intervals of not less than eight years, one year or such other period as together with all periods already spent on furlough may not exceed two years, or

(*b*) After eighteen years' service, furlough for two years or any less period; and thereafter, at intervals of not less than eight years, any such period as together with all periods already spent on furlough may not exceed two years. Provided—

(i) That the service for furlough of an officer who has had leave on private affairs counts only from the date of his last return from such leave;

(ii) That the aggregate amount of furlough or of furlough and leave on private affairs taken together shall not exceed two years;

(iii) That an interval of not less than eighteen months has elapsed between last return from privilege leave of over six weeks' duration, whether taken by itself or combined with leave on medical certificate, and the furlough, or privilege leave, if any, with which the furlough is combined.

Extraordinary leave without allowances may, in case of necessity and when no other leave is by rule admissible, be granted for such time as may be necessary—

(*a*) An officer on leave on medical certificate is entitled to half his average salary for the first fifteen months of each period of such leave but not for more than thirty months in all. For the rest of his leave he is entitled to a quarter of his average salary.

(*b*) An officer on furlough or on leave on private affairs is entitled to half his average salary.

Half average salary and quarter average salary are subject to certain maximum and minimum limits.

Remarks.—The rules should be modified in the same respects as those recommended for Imperial services as regards privilege leave. As regards restrictions on interval between periods of furlough, it is considered the first furlough should be admissible after five years' active service and further furlough subject to an interval of four years. The total furlough admissible should be one-eighth of the active service subject to a maximum of four years in the total service. The privilege of converting furlough for half the period on full pay recommended for Imperial Engineers is recommended only when the furlough is spent in Europe.

72,202. **(VI.) Conditions of pension.**

Imperial Service.

Present Regulations.—The following is a summary of the principal pension rules applicable to Engineers appointed to the Imperial Service by the Secretary of State from the United Kingdom:—

An officer is eligible for a pension on voluntary retirement after completing 20 years' qualifying service or attaining the age of 55 years. If at an earlier date he is compelled to retire from the service through ill-health not occasioned by irregular or intemperate habits, he becomes eligible for an invalid pension or a gratuity according to the length of his service.

The amount of pension or gratuity is regulated as follows:—

After a service of less than ten years, an invalid gratuity not exceeding one month's emoluments for each completed year of service.

After a service of not less than ten years an invalid pension not exceeding the following amounts:—

Scale of pension.

Years of completed service.	Sixtieths of average emoluments.	Maximum limit of pension.
10	20	Rs. 1,000 a year or Rs. 83⅓ a month.
11	21	Rs. 1,400 a year or Rs. 116⅔ a month.
12	22	Rs. 1,800 a year or Rs. 150 a month.
13	23	Rs. 2,200 a year or Rs. 183⅓ a month.
14	24	Rs. 2,600 a year or Rs. 216⅔ a month.
15	25	Rs. 3,000 a year or Rs. 250 a month.
16	26	
17	27	
18	28	
19	29	

After a service of not less than twenty years, a retiring pension not exceeding the following amounts:—

Scale of pension.

Years of completed service.	Sixtieths of average emoluments.	Maximum limit of pension.
20 to 24	30	Rs. 4,000 a year or Rs. 333⅓ a month.
25 and above	30	Rs. 5,000 a year or Rs. 416⅔ a month.

Officers who have shown special energy and efficiency during an effective service of three years in certain appointments may, at the discretion of the Government of India, be allowed an additional pension of Rs. 1,000 a year, subject to the condition that the officer must not retire voluntarily before the completion of a total qualifying service of 28 years.

Subject to certain prescribed conditions, rupee pensions are now issued at the rate of exchange of 1*s.* 9*d.* the rupee to pensioners residing in countries in which the Indian Government rupee is not legal tender.

Remarks.—I consider the rates of pay now allowed to Imperial Engineers adequate, but some improvement in the pension is urgently called for.

The standard of living and the cost of necessaries both in England and in India has greatly increased in the past 30 years and this has been recognized and suitable increases of salary have been given.

In the matter of pension, actual reduction owing to the fall of the exchange value of the rupee has been sustained. I consider that pensions should be raised to a standard approaching those given to Military officers of the Indian Army and Royal Engineers who have served continuously in India. It is considered that the ordinary pensions of officers should be raised to £300 sterling after 20 years' service and to £600 after 30 years.

Extra pensions of £100 a year should be given for approved service as a Superintending Engineer for three years and an additional £30 for each year's service as a Chief Engineer subject to a maximum of £150.

Provincial Service.

Present Regulations.—An officer is eligible for a pension on voluntary retirement after completing thirty years' qualifying service or on attaining the age of 55 years—*vide* articles 464 and 465, Civil Service Regulations. If at an earlier date he is compelled to retire from the service through ill-health not occasioned by irregular or intemperate habits, he becomes eligible for an invalid pension or a gratuity according to the length of his service.

The amount of pension or gratuity is regulated as follows:—

(*a*) After a service of less than ten years a gratuity not exceeding (except in special cases and under the orders of the Government of India) one month's emoluments for such completed year of service. If the emoluments of the officer have been reduced during the last three years of his service, otherwise than as a penalty, average emoluments may, at the discretion of the local Government, be substituted for emoluments.

(*b*) After a service of not less than ten years, a pension not exceeding the following amounts:—

Years of completed service.	Scale of pension (60th of average emoluments) of last three years.	Maximum limit of pension a year.
		Rs.
10	10	2,000
11	11	2,200
12	12	2,400
13	13	2,600
14	14	2,800
15	15	3,000
16	16	3,200
17	17	3,400
18	18	3,600
19	19	3,800
20	20	4,000
21	21	4,200
22	22	4,400
23	23	4,600
24	24	4,800
25 and above	30	5,000

Remarks.—It is considered that the period of service to qualify for voluntary retirement on pension should be reduced to twenty-five years.

The maximum limit of pension should be as at present up to twenty-five years' service, but should be raised at the rate of Rs. 200 per year up to thirty years. The final maximum will then stand at Rs. 6,000.

72,203. **(VII.) Limitations on the employment of non-Europeans and the working of existing system of division of services.**

Present Regulations.—The employment of non-Europeans (Statutory Natives of India) is restricted to the appointments made in India and 10 *per cent.* of those made in England.

The working of the existing system has not caused any difficulty.

Remarks.—It is considered that the appointment of Indians in England is inadvisable for the reasons already given above under the heading (I).

Appointments in England should be limited to Europeans.

The existing system of division of services into Imperial and Provincial is a logical one and has worked well.

72,204. **(VIII.) The relations of the Public Works Department with the Indian Civil Service and other departments.**—The relations with the Indian Civil Service and other services are good. There is generally little friction and it is not considered that alterations are called for in this respect.

72,205. **(IX.) Other points within the terms of reference not covered by the above heads.**—*Travelling allowances.*—These have not been raised for very many years and are frequently inadequate to cover out of pocket expenses. Generally it may be said an officer is out of pocket when travelling by road for every day on which he moves. Those officers who move slowly halting several days at each camp, recoup their losses on the move by gains on the halting allowances. Officers whose duties require constant moving in camp receive inadequate allowances. When it is considered that the cost of carts and forage has risen over 50 *per cent.* since the allowances were fixed, it is not surprising that such a result ensues. The daily allowances for the days when an officer moves his camp should be increased. The rules further require some revision to suit the more modern mode of travelling—the bicycle, the motor car, etc.

Officers in this Presidency in the Public Works Department generally feel they are unjustly treated in the matter of carrying horses and camp equipment by rail on Government service.

The readings of the rules on this subject (Civil Service Regulations, article 1000) are generally opposed to considerations of justice or common sense and on plea of protecting the public purse—the grossest injustice is occasionally done to officers.

Cases of hardship in regard to conveyance of horses, etc., most frequently occur in connection with transfers, but I have known also cases of intolerable injustice in causing officers to carry their horses by rail when taking them about in the execution of their ordinary duties.

It is considered that officers on transfer should be allowed actual expenses incurred up to some fixed limit for each grade.

For District officers on tour the provisions of Civil Service Regulations, article 1062, may be made to apply. This gives the option of claiming actual expenses for the first journey out of and back to headquarters.

Inspection of engineering works in Europe.—Greater facilities for seeing works in Europe by officers on leave should be given. The suggestion that a party tour should be organized each summer by the India Office for Engineer officers on leave to visit engineering works in progress in England is supported. Adequate allowances for personal expenses on such tours should be given to officers accompanying them. The time spent on tour should generally count as part of the furlough.

Colonel W. M. Ellis, called and examined.

72,206. (*Chairman.*) He held the post of Chief Engineer for Irrigation and joined the Public Works Department in 1888. Previously to joining the department he spent four years in Burma.

72,207. The present method of selection in England was satisfactory and the recruits coming out from the different engineering colleges compared favourably with those who came out in the old days from Cooper's Hill. He objected to recruitment by competition amongst selected candidates. The present qualifications of the recruits were adequate.

72,208. Imperial engineers should be on probation in India for a period of two years, not so much with a view to training as with a view to enabling the local officers to judge of their suitability. It was desirable that a man should have some practical experience of works, but it did not make much difference whether that experience was gained in

England or in India; in fact if works were available at the time there would be certain advantages in India.

72,209. He favoured the existing system of division into Imperial and Provincial but would do away with the present rule under which 10 per cent. of Indians were recruited in England. Recruitment in India would give a better selection of men who were in touch with prevailing conditions. He would leave it to the discretion of the local governments to select men from the provincial or subordinate services, but there would be no objection to leaving the posts open to the whole profession whether in Government or any other service. He had sent in the written statement under the impression that it was his business to put forward views which would be acceptable to Government but discovered later that it was his own personal views which the Commission required. His own opinion was that there was no necessity for the 10 per cent. and that Government could get better value for their money by appointing the English engineer in England and the Indian engineer in India.

72,210. There appeared to be a certain amount of dissatisfaction amongst provincial officers with the designation provincial and he would favour the removal of any form of nomenclature which might create invidious distinctions. Officers doing the same work should be in the same service, but he held to the principle that a European recruited officer should have a compensation allowance over and above the ordinary pay of the service.

72,211. He was the only Royal Engineer in the service at the present time and none were being recruited to the department.

72,212. He had not considered the question of a central college but saw no great objection to it. The engineering training at the Madras college was adequate. He did not lay much stress upon the actual detail of the courses at engineering schools; if a man was going to make a good engineer he would benefit by the course at any engineering college provided it attained a fair standard. The difference between two men of equal capacity after ten years would not be very great if one went to a rather inferior school and the other to a somewhat superior school. He agreed, however, that the better the school the better a man was likely to be, and he desired to see the Indian given an opportunity of a standard equal to that of the engineering colleges in England.

72,213. A recruit joining the upper subordinate service was given a year's practical training when he came out of the college and did not get an appointment till some time after that. The upper subordinate officer was working satisfactorily.

72,214. Temporary Engineers had been working in the service for the last seven or eight years, and some of them were doing permanent work in connection with irrigation, roads and buildings. All kinds of work were included in the duties of an executive engineer, the only officer allocated to a separate branch being the Chief Engineer for Irrigation. It did not pay where works were scattered to have officers for different classes of work. The subordinate officer had to take any work that might occur within his charge. For buildings and roads, he took his orders from the officer in charge of buildings and roads, and for irrigation from the irrigation officer. Temporary engineers at present were in a very poor position in regard to prospects and he had a great deal of sympathy with them. Those who had been on permanent work for some years might be taken into the cadre of the service. In doing so age and standing would have to be considered and also due regard paid to the position of the officers in the service. A Temporary Engineer could not be put at the bottom of the list if he had any experience or length of service; on the other hand if he was brought on to the cadre at some point up the scale it would rouse a grievance amongst the officers.

72,215. It was very important that inefficient officers should be compulsorily retired. If Government now possessed that power it did not appear to use it. A man could be reduced but that did not meet the case as in his reduced capacity he continued to do still more inferior work. A man retired for inefficiency should be treated generously; up to ten years he might be given a double gratuity and between ten and twenty some increase of pension. That was open to the objection that it would be treating him more generously than an invalided officer, and perhaps the proposal was not a good one; in any case Government should have the option of giving compensation. It was possible that a man might wish to leave the service and with malice aforethought might perform his work inefficiently, and therefore it was necessary that Government should have discretionary power.

72,216. Increased salary was necessary for officers in the grade of Chief Engineer. The difference between his pay and that of the Superintending Engineer was not commensurate with the extra responsibility of the post. The Chief Engineer now received Rs. 2,750 and Rs. 250 as Secretary to Government, and he should receive at least Rs. 500 more than the man below him. The Chief Engineer for Irrigation received Rs. 2,500 and Rs. 250 as Secretary to Government, so that the difference between the officers was Rs. 250, whereas the responsibility of the higher post was worth a great deal more than Rs. 250. The present salary of Rs. 3,000 could not be called a bad salary.

72,217. It would be an advantage to the service to separate the Assistant Engineer and Executive Engineer and have two time-scales, with selection from one grade to the other. A man's qualifications were always carefully considered before he was given charge of a division and if a man was not considered fit he was passed over. At present an officer had occasionally to wait in the Rs. 800 grade before he received executive rank, on account of there being no vacancy. If he had to wait for two years before being promoted he should take up his position in the time-scale allowing for the two years he had waited. It would be rather hard on an officer not to compensate him for being kept back through no fault of his own.

72,218. Very few officers took advantage of the privilege of optional retirement at twenty years, but the concession was very much valued. From the point of view of the service twenty years was rather short. If they had to chose between a larger pension and the retention of optional retirement after twenty years the majority would prefer a longer term of service and a larger pension.

72,219. He did not think that private contractors could do the work so cheaply as the Public Works Department. There were a few large engineering firms who were prepared to make designs and to act as engineering contractors, but the majority of contractors were only collectors of labour and practically looked for supervision to the engineering staff. The rates of tender of large firms for miscellaneous works were very much higher than the rates of the Public Works Department. In any case a certain number of engineers would have to be maintained by the department.

72,220. (*Lord Ronaldshay.*) He was not aware that the Government had the power of retiring inefficient officers but did not exercise the power because they had no discretion to award pensions to officers so retired.

72,221. There should be nothing derogatory to a locally recruited service, which performed the same work and was on the same list for promotion as the service recruited from England. An officer recruited in India would draw less pay and would be under different rules with regard to leave and pension. The only alterations he proposed were, first, to change the name of provincial service and secondly to stop recruitment of Indians in England.

72,222. (*Sir Theodore Morison.*) The periods of leave now allowed were liberal. An officer should, however, be allowed to commute his furlough into shorter periods on full pay within certain limits.

72,223. A pension of £600 should be payable to an Executive Engineer on retirement after a full period of service, and Superintending Engineers should be eligible for a pension of £700 and Chief Engineers for a pension running up to £850. That proposal was put forward in order to bring the pensions of Public Works Department officers into line with those

of Royal Engineer officers, who received £700 no matter what their rank.

72,224. (*Mr. Chaubal.*) He was against any form of competition and preferred the present method of selection. Any firm engaging an Engineer would do so by selection. It was true there was some difference between a system of recruitment for a recognized service and the occasional employment of an Engineer by a private firm, but the men obtained would be pretty much the same. Men might be brilliant in an examination and yet be inefficient, but the chances of obtaining such men were reduced by selection. It might be more satisfactory to the public to know that a man was being chosen on his merits by an examination, but his proposal was made rather with a view to efficiency than with the object of satisfying public feeling. He knew of instances in which candidates successful in examinations had proved failures, and had also known of failures amongst selected candidates, but the failures were fewer amongst the latter.

72,225. An Indian selected by the Secretary of State had generally lived in England about three or four years, and three years' absence at such a time of life rather put him out of close touch with the languages, customs, and mode of life of his own people. An Indian who was appointed in England might belong to the Punjab or the United Provinces and be posted to Madras, where he would be as much a stranger as a young Englishman. An Englishman had certain general advantages over an Indian and an Indian had certain general advantages over an Englishman. The Englishman was generally able to apply his theoretical knowledge in a more practical way, while the Indian was more in touch with the labour of the country, but by going to England he lost some touch with his own province, though no doubt he was more acquainted with it than the Englishman. It could not be said that an Englishman who served in India for twenty years lost touch with the manners and customs of the English people as he lived amongst his own people in India and spoke the same language. It might be of advantage to an Indian to be trained in the better institutions of England, and to live and move about for some years in western society, but the field of selection of such men would be extremely limited.

72,226. If a European officer received the pay that he would receive in his own country, *plus* 50 per cent. as a compensation allowance for serving in India he ought to be satisfied, but the question arose as to whether men could be obtained on such terms.

72,227. (*Mr. Sly.*) Important works were carried out generally by a system of petty contracts. As a rule large contractors were not forthcoming at reasonable rates. Large works had not been constructed in Madras for a great many years. In Madras town a single building as a rule would be taken up by a single contractor, but there was one in the town who was prepared to work on a large scale.

72,228. (*Mr. Fisher.*) The Indian Assistant Engineers generally received their engineering education in the presidency, their appointments being all made from the Madras college. Temporary Engineers might come from anywhere, and most of those now employed were educated outside the presidency. The facilities at the Government college were not sufficient to meet the demand for engineers. The output of subordinates was much below what was required and practically the department had to take anybody it could get. There had been a great increase in the demand for engineers and subordinates, especially the latter, by district boards and municipalities. Therefore a considerable extension was needed in the Madras college.

72,229. (*Mr. Madge.*) The period of probation he had recommended would practically mean that a man came out on an engagement and that at the end of that period was either kept on permanently or his engagement terminated. There was a good deal of difference of opinion as to whether such uncertainty of tenure would present the better class of engineers coming forward, but personally he believed that a man who had confidence in himself and who had a guarantee that a certain percentage of the men who came out would receive a permanent appointment would generally think he would be one of the permanent men. There should be power of dismissal at any period of a man's career. Cases were by no means rare of a man who was quite good in his youth but became worthless later in life, and when a man was useless he should be got rid of whatever might be the cause. That might prejudice recruitment and that was why he had said that inefficient officers should be treated with great generosity and not be thrown on the world without provision.

72,230. He did not know whether promotions of Anglo-Indians had been made from the upper subordinate grades, but there had been several such promotions from the domiciled community. There were very few Anglo-Indians in the subordinate ranks of the department. On the average their work was much the same as that of other officers in the department. There was only one promotion by selection every two years.

72,231. (*Mr. Abdur Rahim.*) Indian trained officers were employed on construction to a very considerable extent, but no very large work had been done since the Periyar and Rushikulya works many years ago, neither of which was in charge of provincial engineers, though provincial engineers and upper subordinates were employed on the works. Some of the Indian college trained men had done very excellent work indeed. The two works he had mentioned were built twenty years ago when there were fewer Indians in the service than there were now.

72,232. There had been a great deal of investigation work going on but that was quite different from the actual execution of works. Investigation work consisted in surveying and considering the lines on which projects ought to be drawn up and in making designs for large works, and he agreed with a statement made by a witness that in the investigation of some of the big projects in the Madras Presidency the Indian trained element was greatly in requisition and had to bear a very considerable share of the burden and responsibilities of the work. He also agreed that whatever was possible should be done to foster Indian engineering talent, but personally he did not think it would be to the advantage of the Government service that Indian college trained engineers should be employed in larger numbers in the Public Works Department. Whether it would be a matter of policy was another matter. Excluding the exceptional men, of which there were several brilliant examples in the department, the Indian did not make as good an engineer as the Englishman; he excelled in book work, but was not quite so good in the practical application of his learning. The best brains of the presidency went in for law where there were a great deal more openings than there were in engineering.

72,233. He was not prepared to say that the probationary training was everything it might be, in the case either of the European or of the Indian officer. They were sent to a division to learn their work, but the Executive Engineer as a rule had very heavy duties of his own and could not give a great deal of time to the training. He denied, however, that a difference was made as between European and Indian probationers. As a rule the probationers were not taken round with the Executive Engineer when he was on his tour. The training might be capable of improvement if officers were appointed to go about with the probationers and give them the teaching which the Executive Engineer had no time to give.

72,234. (*Sir Valentine Chirol.*) He would be prepared to admit a claim for higher pay by Indians serving in a different province from their own, as an Indian would not go to another province unless he did receive more pay. He agreed with a previous witness that a Bengali serving in Madras would be as much a foreigner in a foreign country as a European serving in Madras; but at the same time he would far rather have a Madrassi serving in Madras than a Bengali.

72,235. (*Sir Murray Hammick.*) Diaries of the probationers did not go to the Superintending Engineer through the Executive Engineers, but probationers as a rule were reported on quarterly or half-yearly to the Superintending Engineer who would send the reports on to the Chief Engineer, and if the Superintending Engineer was not satisfied with the training he would make a note on the reports accordingly.

72,236. (*Mr. Pears.*) He would not insist on students passing out of the college serving as upper subordinates in the Public Works Department in the

interval between their passing out of the college and the occurrence of a vacancy.

72,237. In saying that the time scale was adequate he assumed that the condition of pension and leave would be improved. At present the salaries were not adequate to make up for deficiencies in pension.

72,238. He could not see any object in the restrictions now placed on the taking of privilege leave immediately before retirement. The rule involved Government in a certain amount of inconvenience, as it was rather apt to lead a man within a year of retiring to take any leave due to him in order not to lose it. If he was allowed to take it at the time he retired he would probably take it just before retiring and there would be no break in his service. There was also a certain amount of administrative inconvenience arising from the fact that a man on returning from privilege leave had sometimes to occupy a post for three months before he retired.

72,239. He objected to the rate of exchange for the rupee being 1*s.* 9*d.* for a man retiring in England and 1*s.* 4*d.* for a man living after retirement in India. When a man was paid out of Indian revenues he should not be penalized for settling down in the country.

72,240. The question whether a Temporary Engineer placed in a permanent post would cause a grievance amongst the permanent men superseded would depend on the place in which the officer was put. It he was put in somewhat below coevals he was not likely prejudicially to affect the men below him until it came to selection for administrative ranks.

72,241. There was not a great deal to choose between departmental work and contract work in regard to quality. Quality depended on the efficiency of the supervision of the engineer in charge.

72,242. He could not recall any instance in the presidency where an engineer had been kept waiting for a division owing to there being no vacancies.

72,243. Investigation of a project would involve a good deal of local inquiry from ryots as to rainfall, flood level, value of land, etc., and for such enquiries an Indian engineer would be specially suitable, but the advantage of the Indian officer would not be so great when it came to the execution of the project. For the execution of minor projects in Madras Indian engineers had been employed in certain cases.

72,244. (*Mr. Bhaskara Ayyar.*) Where projects had been worked out by Indian engineers he had no reason to doubt they had performed their work thoroughly well, but as he had only assumed charge of his present office recently he was not in a position to give an opinion. He was not prepared to say that Indian engineers had not shown energy and resourcefulness in their work.

72,245. If Indians were given the same charges as European engineers and were as efficient he had no objection to giving them any amount of pay, but he did not think it was necessary from the point of view of Government to pay a man above the reasonable market rate, and the market rate of an engineer in his own country was different from the market rate of the imported engineer. If there were men in the country able to do the work he did not object to their being largely employed, on the understanding that they were as efficient in every respect.

72,246. He would not exclude a member of the subordinate establishment from being appointed to the Imperial service if he was considered a good man. He would appoint the best available man in each vacancy as it occurred but would bar any man over thirty years of age.

(The witness withdrew.)

W. J. J. Howley, Esq., Superintending Engineer, Madras.

Written Statement relating to the Public Works Department.

72,247. **(I.) Methods of recruitment.**—The present method of selection of Imperial Engineers by a Selection Committee in England is satisfactory, but it is suggested that at least 50 per cent. of the Selection Committee should be senior officers of the Public Works Department, either on the active or the retired lists.

72,248. **(II.) Systems of training and probation.**—*Probation.*—It is considered that there should be no period of probation after appointment. The opinion is that a period of probation after appointment would act as a deterrent preventing the best men from offering themselves; and, moreover, that it would be of very little use unless unduly prolonged. The Selection Committee should be in quite as good a position to decide as to a man's fitness for permanent appointment as his superior officers in India would be after a probation of say one year

Training.—It is suggested that a recruit after appointment should have a year's practical experience on engineering works in the British Isles, instead of this being required as a condition of appointment. It should be ascertained to what Presidency and to what branch the new assistant would be posted, so that he might be sent to works where he would gain experience likely to be useful to him on joining his appointment. During this period of training the Assistant Engineer would be required to prove himself a competent horseman and to study the vernacular of his province (or such one of them as might be prescribed). His knowledge of the vernacular should be tested by examination during this practical course: the standard required need not be high.

72,249. **(III.) Conditions of service.**—It is suggested that the cadre of Permanent Engineers should be more frequently revised, and less dependence placed upon the employment of Temporary Engineers.

Much dissatisfaction has occasionally been caused by the transfer of Temporary Engineers to the permanent scale. It is suggested that future appointments of Temporary Engineers should be on the distinct understanding that no man so appointed shall under any circumstances be brought on to the permanent scale. With regard to Temporary Engineers already serving, it is considered that the interests of men permanently appointed in the usual way should be fully safeguarded for promotion to administrative rank.

72,250. **(IV.) Conditions of salary.**—Although the scale of pay of the Public Works Department was revised and placed on an incremental basis in 1908, the Exchange Compensation Allowance formerly given was withdrawn and the net increase in actual emoluments is not commensurate with the greatly increased cost of living during the past decade.

Under the re-organisation scheme of 1908 it is ruled that an officer may not draw more than Rs. 800 per month unless he is in charge of a Division, or in a charge which the Local Government consider to be of equal importance. This rule is a hardship to an Officer who, though fully qualified, does not obtain a divisional charge simply because there is no vacancy for him. It is therefore suggested that an officer of the Imperial Service reported as fit for divisional charge should continue to receive the ordinary increments, irrespective of his being in actual divisional charge.

Under the reorganisation scheme of 1908, Executive Engineers attain their maximum pay of Rs. 1,250 per mensem after 19 years' service. It is urged that if an Executive Engineer, though otherwise qualified, is not promoted to a Circle charge after 20 years' service, he should continue to draw annual increments of Rs. 50 per mensem, subject to a maximum of Rs. 1,400 per mensem.

72,251. **(V.) Conditions of leave.**—The rules governing the grant of furlough to Imperial officers of the Public Works Department appointed in England are practically identical with those which apply to the Indian Civil Service and to Military Officers in Civil Employment; *except* as regards the amount of allowances. In the case of the two classes of officers just mentioned, furlough allowances are subject, if paid at the Home Treasury, to a *minimum* limit of £500 per annum, or the full amount of salary last drawn, whichever is less; and to a *maximum* limit of £1,000 per anum. On the other hand, for Civil Engineer officers of the Public Works Department, there is *no minimum* limit, while the maximum has

been fixed at only £800 per annum. The following table shows the *maximum* furlough allowances permissible to Imperial Civil Engineers under the present rules:—

Years of completed service.	Maximum furlough pay. £
8	279
9	297
10	316½
11	337½
12	360
13	382½
14	405
15	427½
16	450
17	472½
18	495
19	517½
20	540
21	555
22	562½
After 3 years as Superintending Engineer, 3rd Grade	675
After 3 years as Superintending Engineer, 2nd Grade	787½
Thereafter	800

It is urged that Civil Engineer Officers on the Imperial list should not be subject to *maximum and minimum limits* of leave allowances different from those applicable to officers of the Indian Civil Service and to Military Officers subject to civil leave rules. A Royal Engineer in the Public Works Department, with 8 years' service to his credit, is entitled to *almost double* the furlough allowances of a Civil Engineer officer doing exactly the same class of work and having the same service in the Department. It is not till a Civil Engineer officer has completed 18 years' service that he can draw an allowance approaching that of a Royal Engineer officer after only 8 years' service. There is no valid reason why Civil Engineer officers should be so very much less favourably treated than their brother officers in the Royal Engineers. It is, however, not merely on the ground that other classes of Officers doing the same work draw much higher leave allowances that a claim is made for an increase in these allowances, but because the present furlough allowances are so inadequate that a large number of Civil Engineer officers cannot avail themselves of the furlough due to them, and which the state of their health demands that they should take. This question of improved leave allowances has already been raised in Memorials submitted by Civil Engineer officers to His Majesty's Secretary of State for India in 1912 and 1913.

Special leave.—It is suggested that the allowances paid during special leave should be the same as in the case of furlough.

Privilege leave.—Under the present rules privilege leave can be accumulated up to a period of three months only. It is a frequent occurrence that when an officer has accumulated the full period of privilege leave admissible (three months), the exigencies of the public service do not permit of his being allowed to take the leave, and in consequence his service ceases, for the time, to count for privilege leave. It is suggested that in order to avoid this loss of valuable leave on full pay, the period up to which it may be accumulated should be increased from three to six months.

An officer should be allowed to avail himself of privilege leave due to him immediately before retirement, and to retire from the Service at the end of his leave, instead of having first to return to duty, as is the case under existing rules. This concession would remove a legitimate grievance and would obviously tend to reduce administrative inconvenience.

The concession has already been applied to privilege leave when combined with any other form of leave and all that is asked for is its extension to privilege leave alone.

Study leave.—It is very desirable that officers of the Public Works Department should be allowed every opportunity of making themselves acquainted with modern developments in Engineering practice at Home and abroad. At present Civil Engineers can visit works in the British Isles and elsewhere only as private individuals and at their own expense, unless placed on deputation or specially permitted to visit certain works while on leave. In the latter case, certain travelling and other expenses are allowed, but the time spent in the visits counts against the officer's period of leave. It is suggested that officers should be allowed greater facilities for inspecting work outside India and should be encouraged to do so. In the Indian Medical Service, for example, an officer is allowed Study Leave in England up to one year out of total service, in addition to furlough. During this period he receives not only furlough pay, but also lodging allowance amounting to four to eight shillings per day.

72,252. **(VI.) Conditions of pension.**—The question of pensions is the greatest grievance of Civil officers of the Public Works Department. The amount of retiring pension admissible under the existing rules is totally inadequate and has formed the subject of numerous Memorials to the Government of India and to His Majesty's Secretary of State for India. Notwithstanding the great increase in the cost of living and the much higher qualifications now required from officers entering the Service, the present pensions are actually less than they were 40 years ago. Copies of the Memorials submitted by Civil officers of this Department during the past six years are attached as Appendices.* Although the first memorials were submitted in 1907, no reply thereto was furnished till August, 1912, when the petitioners were informed by the Government of India that no decision could be arrived at pending the receipt of the report of the Royal Commission on the Public Services in India. Civil Engineer officers, therefore, now look hopefully to the Royal Commission for redress of this long-standing grievance, and respectfully urge that the scale of pensions prayed for in the Memorials of 1912 and 1913* may be recommended.

In full confidence that the Royal Commission will realise the justice of these claims it is further urged that any improvements made in the scale of pensions should have retrospective effect, at least from the year 1908, seeing that the grievance was brought prominently to the notice of the Government of India in the Memorials of 1907-1908, to which no reply was vouchsafed, and that in the meantime many officers have been placed upon the retired list and many more will probably be retired before any decision is arrived at.

Invalid pensions.—Prior to 1884, invalid pensions granted to all officers belonging to the Uncovenanted Services, with which the Public Works Department was then classed, were governed by Article 474 of the Civil Service Regulations. In Lord Kimberley's Despatch of 1883, however, a new scale of pensions (known as the "more favourable" pension rules) was introduced for English-trained Engineers and Telegraph officers. Under this scale, which is governed by Article 641 of the Civil Service Regulations, the fixed maximum rate of invalid pension has been reduced, although the amount calculated on a percentage basis has been increased. The net result is that a Civil Engineer officer, if invalided after 10, 11, 12, 13, 16, 17, 18 or 19 years, would draw a *less* pension than officers of other Services coming under Civil Service Regulations, Article 474, and drawing the same pay; while if invalided after 14 or 15 years' service he would draw *more pay*. In order to remove this anomaly it is urged that the fixed maximum limits under Article 641 should be increased to at least the same as those fixed under Article 474.

* *Vide* Appendix XIII.

The following comparative table will make clear the difference:—

Years of completed service.	C.S.R. Article 474.		C.S.R. Article 641.		
	Amount calculated on a percentage basis.	Fixed Maximum.	Amount calculated on a percentage basis.		Fixed Maximum.
		Rs.		Rs.	Rs.
10	10/60	1 406	20/60	2,813	1,000
11	11/60	1,650	21/60	3,150	1,400
12	12/60	1,920	22/60	3,520	1,800
13	13/60	2,210	23/60	3,910	2,200
14	14/60	2,520	24/60	4,320	2,600
15	15/60	2,850	25/60	4,750	3,000
16	16/60	3,200	26/60	5,200	3,000
17	17/60	3,570	27/60	5,670	3,000
18	18/60	3,960	28/60	6,160	3,000
19	19/60	4,370	29/60	6,670	3,000
20	20/60	4,800	30/60	7,200	4,000

Family Pension Fund.—Unlike the Indian Civil Service and the Military Services in India, there is no official Family Pension Fund for the Public Works Department. The emoluments of officers are not sufficient to admit of their making adequate provision for their families. Pension has been officially defined as "deferred remuneration," which means that part of an officer's salary is withheld as a contribution towards the cost of his pension. Now if an officer dies while still in the service, or shortly after retirement, the whole, or almost the whole of this "deferred remuneration" is lost and his family may be left utterly destitute. If, however, the officer had the option of investing with an Insurance Company, the amount assumed to have been retained by Government as his contribution towards his pension, he could so arrange that in the case of his death before the date from which the annuity would commence a considerable amount in cash or an annuity would be payable to his widow or other member of his family dependent upon him. There is therefore a desire that some form of Family Pension Fund, applicable perhaps to other Services similarly unprotected as well as to the Public Works Department, should be introduced by Government.

72,253. **(VII.) Such limitations as may exist in the employment of non-Europeans and the working of the existing system of division of services into Imperial and Provincial.**—It is considered that if the present standard of efficiency in the Department is to be maintained, the European element must largely preponderate in the Imperial Branch for some considerable time. The number of appointments in the Imperial Service at present reserved for Indians is 10 per cent. and this proportion appears to be suitable for the present.

It is considered that Engineers recruited in England should receive a higher rate of pay than those recruited in India, whether all are included in one Service, as has been proposed, or in two distinct Services (Imperial and Provincial) as at present.

72,254. **(VIII.) Relationship to the Indian Civil and other services.**—The relationship between the Public Works Department and the Indian Civil and other Services in India is considered to be satisfactory.

72,255. **(IX.) Other points within the terms of reference to the Royal Commission not covered by the preceding heads.**—It is considered that some revision of the present Travelling Allowance Rules is necessary, especially with regard to transfers. At present a transfer is frequently a matter of very considerable expense to an officer. It is suggested that actual expenses, subject to reasonable limits, should be paid. It is also considered that Article 1000, Civil Service Regulations, as at present interpreted, imposes undue restrictions, especially in this Presidency, where the charges are very large.

Mr. W. J. J. Howley called and examined.

72,256. (*Chairman.*) The witness represented the European Imperial Engineers of the Public Works Department, Madras. He had been in the service twenty-five years.

72,257. The present method of selection was generally satisfactory. It was considered by the officers he represented that a period of probation, after appointment, would deter the best men from applying for appointment. Personally he thought probation made for efficiency in the service. He did not regard the question, however, as one of special importance.

72,258. The ten per cent. limit of Indians should be maintained, but the question had not been really gone into by his colleagues. There were certain objections to a mandatory rule that ten per cent. should be appointed whether they were available or not, and on the whole it might be better to recruit Indians in India than in England. He agreed with Colonel Ellis's evidence on that point.

72,259. He saw no objection to the abolition of the present division into Imperial and Provincial branches, provided the distinction with regard to salary was maintained. The services should be all on one list with a common designation. Officers recruited from Europe should be granted an additional allowance.

72,260. He had no personal experience of the Madras Engineering College, but judging by results the training appeared to be sufficient. He saw no difference between the technical qualifications of Indians who came out from England and of Indians trained in India.

72,261. He was unaware of the exact conditions under which Temporary Engineers were appointed. They were doing the same maintenance work as permanent men. It would be reasonable to increase the cadre to the extent of the number of Temporary Engineers employed on permanent work.

72,262. With regard to salary, Assistant Engineers who were considered to be qualified for a divisional charge but for whom no divisional charge was available should continue to receive the ordinary annual increments, and there should be no check at Rs. 800. He was not looking at the matter from the point of view of economy but from the point of view of the engineers themselves. The Imperial Engineers whom he represented considered that an officer had a right to expect that, with nothing against him, he would go on getting regular increments of pay.

72,263. With regard to study leave, the Indian Medical Service and the Royal Engineers were granted a certain amount of study leave for which they received pay and allowances, but engineers had to pay their expenses out of their own pockets unless they were put on deputation. Study leave should be given with allowances, to enable men to visit constructional works in other parts of the world.

72,264. The officers he represented laid very great stress on the insufficiency of existing pensions. They did not desire to have a family pension fund in substitution for the present provident fund. They had now the right to subscribe to an insurance company and to draw on their balance in the provident fund for this purpose. They were afraid that if a family pension fund was merely established and administered by Government without the promise of any Government contribution, they would not get as good terms as from leading insurance companies. There was a difference of opinion amongst the officers as to whether just as good or better terms would not be obtained from insurance companies as from Government.

72,265. (*Sir Murray Hammick.*) His colleagues were in favour of commutation of pension. There was the risk of an officer using the money up before his death, but it involved too much interference with a man's personal liberty for the Government to say in what manner he should deal with his own money. The officers he represented claimed that they paid largely for their pension annuity, that it was partly deferred pay, and on that ground they looked for liberal assistance from Government in the event of a family pension fund being established. They would not care for a Government family pension fund unless it was

contributed to by Government and based on more favourable terms than the terms of an insurance company. Possibly it was the right of Government to some extent to see that an officer made reasonable provision for his family, and it was on that ground that contribution to a provident fund was compulsory.

72,266. (*Mr. Abdur Rahim.*) The Indian engineer who had been to England, although possibly no better theoretically than an Indian trained engineer, had certainly an advantage in that he had visited works and learned how works were carried out by European contractors. He also had some advantage in dealing with his brother officers, as European training was of value in creating an *esprit de corps* in the service. On that ground there was no reason why a small percentage of recruitment in England should not continue.

72,267. (*Mr. Madge.*) No Temporary Engineers, so far as he knew, had been discharged on account of there being no work for them; and there were Temporary Engineers filling posts of a permanent nature. If the cadre was increased by including trained and tried Temporary Engineers it would do no harm until the question of their promotion to the Superintending Engineer grade came up, but their absorption in the cadre would be always looked upon as a grievance by the men below them. If the administrative ranks were also increased there would be no objection. The work in the divisions was so large that they might well be broken up and extra divisions formed.

72,268. Engineering work was increasing in India, but it was not up to the standard of work in Great Britain, and it was more useful for an officer to visit works in that country. He did not suggest that an engineer should specially go to Europe for study, but when at home he should have an opportunity of visiting works, and receive an allowance for doing so.

72,269. (*Mr. Pears.*) It might be sufficient to guarantee the out-of-pocket expenses of officers on study leave and to allow the study leave to be treated as part of an officer's furlough.

72,270. It would be a good arrangement to convert some of the present half pay furlough into a shorter period of furlough on full pay.

72,271. If a man was entitled to draw a pension in England at 1*s.* 9*d.* he should be allowed to draw it at the same rate in any other part of the world; and more especially in India, as it was obviously undesirable to penalise men for spending in India pensions paid from Indian revenues.

72,272. If a family pension fund was introduced it should be as a separate fund and not merely a modification of the present provident fund. If good engineers could be obtained on a much lower pay in India that might be, from an administrative point of view, a sufficient reason for not recruiting them in England.

72,273. (*Mr. Bhaskara Ayyar.*) If the Secretary of State was prepared to increase the 10 per cent. of Indians, he had no objection to offer on the part of the men he represented. He recommended different rates of pay for officers recruited in India and in England on the ground that a European officer was put to a much greater expense owing to his domicile being in England.

72,274. The view of the majority of officers he represented was that probation would deter the best men from applying for appointment.

72,275. It was not easy to learn the vernacular in England, but a certain grounding in Hindustani could be obtained. Although the vernacular was better learned in the place where it was spoken, a student in England might, during his period of probation, utilise part of his time in language study.

72,276. He would apply the proposed concession with regard to pay being continued when an officer had to wait for a vacancy to the Provincial as well as to the Imperial Engineer.

(The witness withdrew.)

M.R.Ry. R. A. Srinivasa Ayyangar Avargal, Executive Engineer, Madras.

Written Statement relating to the Public Works Department.

72,277. **(I.) Method of recruitment.**—The Engineer Officers of the Department are at present recruited in 5 ways.—

(1) By appointment by selection in England, of Civil Engineers by the Secretary of State for India assisted by a committee;

(2) By appointment of Royal Engineers;

(3) By promotion of Temporary Engineers, howsoever recruited in the first instance;

(4) By appointment of passed Engineer Students of the Indian Engineering Colleges; and

(5) By promotion of deserving Upper Subordinates.

The method at present followed for recruitment of Civil Engineers in England is to appoint the men selected by a Committee of Engineers appointed by the Secretary of State for India. There is no competition whatever and as such, there is no guarantee that the best available men have been selected. A system of selection, on the results of a competitive Examination, from candidates nominated by a Committee, is likely to secure far better results and is therefore recommended for adoption. The Examination should be in Engineering and allied subjects with special reference to the requirements of India. There must be at least three candidates selected for every post to be competed for.

There is a restriction placed with regard to selection in England of Natives of India and only 10 per cent. of the appointments made in any year is given to them. This restriction does not seem to be called for and there should be no restriction of race, caste or creed in respect of the appointments made in England, except in respect of the candidates belonging to the Colonies of South Africa and Australia. Inasmuch as the Governments of the Colonies do not treat the Indians with the consideration due to them, their subjects ought not to be admitted to the service of the Government of India in any capacity.

No appointments of Royal Engineer Officers have recently been made, and those that were at one time reserved for them are now being allotted to the Civil Engineers appointed from England.

There have been cases in which men who were appointed Temporary Engineers in the first instance and for whom no hopes of permanent appointment were held out, were subsequently made permanent and promoted over the heads of many of their seniors. This has caused a good deal of dissatisfaction.

With regard to appointments of men from the Indian Engineering Colleges, the practice in Madras was, till recently, to appoint the student who stood *first* in the Engineer class *in the final examination held by an independent Board of Examiners*, provided he successfully passed through the practical course. But recently, the system was changed and the rules provide for a selection by the Principal and the Chief Engineer *from among the students of the Engineer Class who pass at the final examination held by the College staff*. This latter system is likely to lead to undesirable results, and we would recommend the reversion to the older system.

The promotion of deserving Upper Subordinates to the Engineer Establishment, as followed in Madras, has not attracted the best of the available men, as they were always appointed with the starting salary of an Assistant Engineer. The rules are not against giving higher salaries, and a more judicious system of appointing deserving men to any class and on any salary is likely to produce better results.

According to the reply given to a question asked in the House of Commons on 19th April 1911, the number of Civil Engineers recruited in England has averaged 30 for a series of years. The number appointed in India is 14 (9 from the Colleges and 5 by promotion of Upper Subordinates). The correct figures for the last ten years are that 507 Imperial Engineers were appointed by the Secretary of State for India, which gives an average of 40·7 per year,

and 140 Engineers were appointed in India, which gives an average of 14. Thus the annual recruitments have been 74 per cent. from England and 16 per cent. from the Indian Colleges and 10 from the Subordinates. Thus 84 per cent. of the appointments is made by Selection and only 16 per cent. by open competition. The number of Indians appointed from England during this period of 10 years is only 13, which gives an average of 1·3 per year or 24 per cent. of the recruitments. Thus, the proportion of the appointments is 72 per cent. for Europeans and 28 per cent. for Indians (including promotions from the Subordinate grades).

Taking the figures for the last 6 years since the abolition of the Cooper's Hill College, there have been 221 appointments by the Secretary of State, of which 12 are Indians and 84 appointments in India, the percentages being almost the same.

The above figures are for the whole of India. The figures for Madras are as noted below:—

Period.	Recruitments.			Percentages.	
	England.	India.	Total.	England.	India.
1904-1912 ...	26	22	38	70	30
1908-1912 ...	11	8	12	64	36

Comparing the present circumstances with those that existed at the time of the Public Service Commission, it will be found (*vide* page 362 of Appendix O of the Report of that body) that the annual recruitment from England and from the Indian Colleges was, at that time, in the proportion of 21 to 9, against 40·7 to 9 at present. Whereas the Indian Colleges got 30 per cent. of the annual appointments at the time of the Public Service Commission they get only 16 per cent. at present.

Another point that has to be noticed in this connection is that the Public Service Commission found that the recruitment from the Cooper's Hill College was excessive and recommended that 50 per cent. of the Engineers should be recruited from Cooper's Hill, 20 per cent. from the Royal Engineers and 30 per cent. from Indian Colleges. No effect has been given to this recommendation, and the recruitment from India is only to the extent of 26 per cent. of the annual recruitments, of which 10 per cent. is made up of men promoted from the Subordinate grades.

Circumstances have changed since then, the Cooper's Hill College has been abolished and no appointments are made from the Royal Engineers. The places reserved for the Royal Engineers should have been distributed equally between the recruitments in England and in India. Thus 40 per cent. of the annual appointments should have gone to the Indian Colleges.

The evidence taken by the Commission of 1886 leads one to conclude that there is very little to choose between the best Indian Engineer and his English rival. The training imparted in the Indian Colleges is sound and fairly exhaustive. This fact has, moreover, been publicly admitted by such eminent persons as Lord MacDonnell and Sir J. P. Hewett. The training is further directed wholly to the requirements in India. Taking all the above facts into consideration, it will only be reasonable if it is asserted that the legitimate aspirations of the public in India cannot be satisfied unless a greater proportion of the superior appointments is reserved for competition in India. It is suggested as a suitable remedy that at least 50 per cent. of the total annual recruitment may be made in India at present, and that this proportion should be gradually increased as conditions change.

72,278. **(II.) Systems of training and probation.**—As there is no guarantee that the preliminary training given to the recruits from England is such as to meet the requirements of the profession in India, they should be given two years practical training under selected Executive Engineers and where large works are in progress. During this period, they should be trained in Section and Sub-Division work, in the investigation of projects and in designing. Opportunities should also be given to them of becoming acquainted with the agricultural conditions of the province in which they are employed. They should also gain, during this period of probation, sufficient colloquial knowledge of the local vernacular language. If any probationer fails to give satisfaction at the end of this period, his term of probation may, at the discretion of the local Government, be extended by another year, and his services should be dispensed with at the end of three years if he proves a failure. Any plea that this is unfair or will deter candidates from England, by reason of the attached risk, may be met by the provision of free return passages to rejected probationers.

As the Indian recruit is to be appointed only on completion of one year's practical course, according to the system in force now, no further probation is necessary in his case.

Before confirmation, however, every Engineer must pass the Professional Examination prescribed in the Public Works Department Code. The English recruit should also pass an examination in the local vernacular.

72,279. **(III.) Conditions of service.**—The two years spent on probation by the English recruit and one year in practical training by the Indian recruit should count towards qualifying service for promotion to the Executive Engineer class and for leave, pension, &c.

Officers should be compelled to retire when they attain the age of 55 years, and the provision for the retirement at 50 of officers not promoted to the administrative grade may stand. Government should, also, have power to compulsorily retire any officer, at any time, for continued inefficiency. An officer who finds that his claims for promotion have been continuously overlooked should be given the option of retiring voluntarily at any time.

72,280. **(IV.) Conditions of salary.**—The present incremental system of salary has given complete satisfaction and may be continued.

The salary of the English recruit during his probation may be fixed at the initial salary of an Assistant Engineer, and that of the Indian recruit during his practical course at Rs. 250 per mensem. On being made permanent they may draw the salary due to them in the third and second year of service respectively as Assistant Engineer.

The pay of the Indian recruited element is approximately two-thirds of that granted to officers recruited in England. This is unfair and unsuitable, and has caused great discontent. Both classes of officers are recruited for and are required to do exactly the same work and bear the same responsibilities, and emoluments should depend solely on services rendered. The distinction between the two classes of officers who do the same kind of work and bear the same responsibilities should therefore be obliterated.

72,281. **(V.) Conditions of leave.**—There is much disparity between the conditions applying to each of these two classes of officers. There is also a difference between the rules applying to the Indian and the European recruited Imperial Engineers. Great stress has been laid on the advantage to be derived by an Engineer in visiting works in foreign countries, and the element recruited in England has received undue credit on this account. Unless the conditions of leave are the same, it becomes impossible for an Indian trained Engineer, even if he desires to do so, to secure the same advantage in this direction as English recruited Engineers.

The maximum furlough admissible to the Indian recruited Engineer under the existing rules is 2 years, the first furlough can only be taken after 10 years of active service and the interval between any two furloughs is eight years. In order to enable the Indian recruit to visit works in foreign countries when he is still young, it should be possible for him to go on furlough after six years of active service. The interval between any two furloughs ought not to be more than three years and the maximum amount of furlough admissible should also be increased to one-sixth of the active service subject to a limit of four years.

It must, also, be stated here that the duties of a Public Works Department officer are very onerous and trying, and he requires more frequent rest for

recruiting his health than any other class of officers. In this respect both Europeans and Indians are alike and there should therefore be no distinction between them.

The allowance during furlough should be half the average emoluments subject to a maximum of Rs. 1,000 per mensem if paid in India and £800 per annum if paid in a foreign country.

Privilege leave. Under the present rules an officer can earn privilege leave to the extent of one calendar month for every eleven complete calendar months of duty, and such leave is cumulative up to a period of three months only. In the case of officers who have accumulated the full period it frequently happens that the exigencies of the public service prevent their being granted privilege leave when they desire it, and this leads to the leave lapsing through no fault of their own. It would, in a measure, mitigate against this loss of leave on full pay which an officer has fully earned if the cumulative period were extended from three to six months.

An officer should be allowed to avail himself of all privilege leave due to him immediately prior to retirement and be permitted to retire from the service at the end of the leave without being obliged to return to duty as he is now obliged to do. This concession has already been made when privilege leave is combined with other leave, and its extension to privilege leave alone, besides removing a legitimate grievance among officers of the Department, would lead to much less administrative inconvenience than is now the case.

Study leave. Modern civil engineering is a highly specialised profession and progress in the methods of construction is very rapid. In view of the vast undertakings of the Government of India in the Public Works and Railway Departments, it is essential for efficiency and economy, that the engineering staff of these Departments should keep themselves abreast of modern engineering practice. This can only be accomplished by visiting and studying works of special interest in progress in different parts of the world. The officers of the Public Works Department should be encouraged to visit large works wherever in progress and should be provided with every facility for doing so. Either new rules should be introduced to admit of these facilities being granted, or there should be a much more liberal interpretation of the existing rules regarding the placing of an officer on deputation.

72,282. **(VI.) Conditions of pension.**—Here again there is a much resented distinction (Vide Art. 636 Civil Service Regulations) which will create invidious and unjust anomalies. As it is a well and universally established principle that pensions are granted as retiring provisions for specific services rendered to the State, it is illogical and unjust to create or maintain any distinction in this direction between persons who have, in fact, rendered exactly the same services. In other words pensions ought to be wholly and solely dependent on specific services rendered and not on the place of original recruitment, for this does not involve any special merit.

The maximum amount of pension should be raised to Rs. 7,500 per annum as the cost of living has considerably increased since the amount was fixed at Rs. 5,000.

The service required for voluntary retirement is rather long and may be fixed at 25 years.

The period of furlough to be counted as service for pension requires to be increased as noted below:—

After a total service of	15 years ...	1 year.
do.	20 years ...	2 years.
do.	25 years and above	3 years.

The emoluments of officers in the Public Works and Railways Department are not sufficient to admit of their making adequate provision for their families should they die in harness and there is no official family pension fund for these departments. The knowledge that they are unable to make such provision and that their pensions are purely personal and cease with their death is a source of great anxiety to many an officer whose duties take him into places which are prejudicial to health. There is a strong desire, therefore, that means may be found whereby an officer may be aided in making suitable provision against the event of his death for the members of his family dependent on him. As pension has been defined as deferred remuneration it means that a certain portion of the officer's salary is kept back to provide for pension after retirement. As an officer deputed to foreign service has to contribute towards his pension at the rate of one-sixth of the pay he would have received in the British service, it may be presumed that an officer now receives only six-sevenths of the pay he would have received had there been no provision for pension. It is recommended that a portion of this amount which is thus kept back from the salary of an officer may be commuted as an annuity for his widow and children if he happens to die in harness or soon after retirement.

72,283. **(VIIa) Limitations in the employment of non-Europeans.**—At present the employment of non-Europeans (Statutory Natives of India) is restricted to the appointments made in India and to 10 per cent. of those made in England. This limitation is uncalled for, as no irreducible minimum of the European element seems necessary in a department which is a purely professional and scientific service and has no share in the political administration of the country and in which the employment of purely Indian element will in no degree imperil the British supremacy.

It has already been suggested under the head Recruitment that 50 per cent. of the appointments may be from England and 50 per cent. from India. The recruitment in England should be open to all British subjects (except to those of the Colonies) irrespective of domicile, caste, creed, or colour.

72,284. **(VIIb) Working of the existing division of service into Imperial and Provincial.**—The division of the Public Works Department into Provincial and Imperial sections has been anything but a success and can never be so, in view of the surrounding circumstances and the past history of the Department. The distinction created between the two classes of officers who do exactly the same work and bear exactly the same responsibilities is intensely resented and will, inevitably, result in splitting up the whole Public Works Department into two hostile camps and this must greatly injure efficiency. The interests of the two classes of officers are now widely divergent and this is conspicuous in their relations. The lower pay that the Provincial receives has branded him as belonging to an inferior service and has lowered him considerably in the estimation of the public.

So long as the two classes possess, on the average, equal educational qualifications and professional attainments—and this is undoubtedly the case—any differentiation between them is unworkable. It is impossible to force a distinction in pay where none exists in attainments and any attempts to do so must create complication and raise issues which it would be as well to avoid.

It has already been stated that the training given in the Indian Colleges compares very favourably with that given on the Continent of Europe and it is a fact that many Indian trained Engineers possess superior qualifications to some officers recruited in England. It is also an admitted fact that in the investigations of some of the big projects in the Madras Presidency the Indian trained element was greatly in requisition and had to bear the greater share of the burden and responsibilities of the work.

It is therefore urged that the differentiation between the two services should be abolished and that the alumni of the Indian Engineering Colleges should be restored to the position they formerly occupied; that is to say, there should be only one service in the Public Works Department.

72,285. **(VIII.) Relations of the service with the Indian Civil Service, &c.**—It would be for the good of the country if the relation between the Public Works Department and the Indian Civil Service were more cordial than at present.

72,286. **(IX.) Other points.**—The restriction now imposed on the people of one province (other than those of the domiciled community) disabling them from competing for the guaranteed appointments in other provinces should be removed.

The College of Engineering at Madras does not attract the best available talent in the country, as the prospects of passed students other than those who get the guaranteed appointments are not very encouraging in the Public Works Department, and as the door for entrance to other Departments such as Revenue Survey, Salt and Abkari, Trigonometrical Survey, Railway and Telegraphs, where they can be employed advantageously on account of the special training received by them is now practically closed to them. The passed students should therefore be employed wherever their special training will be beneficial so that the best available talent may be attracted to the College and thereby a still better class of men be had for local recruitment of our requirements and the efficiency of the department be thereby increased.

When I submitted my first Memorandum I dwelt in detail on the subordinate Service. But this service has been since reorganized more or less on the lines indicated by me and the only point that requires consideration is whether the incremental system of salary will be preferable to the present graded system. The concensus of opinion seems to be in favour of the former.

If after all it is decided to have a Provincial Service in the Public Works Department as in the Revenue and Judicial Departments, it is suggested that a few appointments of Executive Engineers may be listed as in those services for the promotion of deserving subordinates. Six such appointments may, for the present, be listed. The Provincial Service should, in such a case, be intended solely for the Subordinates and those promoted to the Executive Engineer grade from the Subordinate service. All those recruited as Assistant Engineers whether in India or in England should belong to one service, i.e. the Imperial. Even this is not liked by the Subordinates. When a Subordinate is considered fit to be promoted to an Engineer's place, he must receive the same remuneration as his brother officers doing the same work.

The scales of travelling allowance given to officers and subordinates were fixed long ago and since then circumstances have changed, the cost of everything, including servants and cart hire, has increased, the allowances are found inadequate to meet the cost of travelling and many officers are obliged to meet a portion of their travelling expenses from their salary. It is therefore reasonable that these allowances should be increased by 50 per cent.

Officers are put to much expense when they are transferred from one place. The expenses of breaking up establishment in one place and of setting it up in a new place and the loss incurred by the sale of furniture, carriages, &c. at one place and buying new ones at the other are in themselves very heavy. Add to this, the cost of moving one's self with family, servants, and the necessary articles of luggage is considerably more than what is paid by Government. The net result is that many an officer is considerably out of pocket by a transfer which is, therefore, regarded as a great punishment. It would be more satisfactory if a liberal set of rules were introduced which would enable an officer to recoup what he actually spent. The Scale recommended by the Madras Government in July, 1912, may be adopted.

M.R.Ry. R. A. Srinivasa Ayyangar called and examined.

72,287. (*Chairman.*) The witness represented the Indian engineers of the Imperial service. He was recruited under the rules by which one guaranteed appointment was given; there were only five such officers now in the service. There were two recruited under the 10 per cent. rule. He was Executive Engineer of the Chingleput district, and had completed nearly twenty-eight years' service.

72,288. The Public Works Department should be recruited both in India and England by competitive examination, and the division into Imperial and Provincial branches should be abolished, as the training given in Indian colleges was as efficient as that given in English colleges.

72,289. Fifty per cent. of the superior posts should be filled by recruitment in England and 50 per cent. by recruitment in India, but Indians should be allowed to compete in either country. The 50 per cent. recruitment in England was only suggested as a temporary measure, as the indigenous element might be introduced in greater proportion as time went on. The 50 per cent. in either country might consist of all Indians or all Europeans according to the results of the examination. The present proportion of officers recruited in India had been laid down by the Government as 30 per cent., but there had not been sufficient time for that percentage to be reached. Since 1886 a relatively smaller number of students had been taken from the colleges. In the early days the bulk of the students came from Rurki and were Europeans. The system of recruitment in India would be on the results of a final examination similar to that at the Madras Engineering College. The competition should also take into account college work, and it might be confined to provinces. He had no objection to a central college if it could be arranged. The superior service might be concentrated in the one college and the provincial colleges might train only for the subordinate services.

72,290. He did not approve of the present system of payment of officers recruited in England and in India. An allowance might be given to the European but that should be based on what he would receive in his own country and not on market values in India. If an Indian served in England it would be reasonable for him to be paid something more tahn he would be paid in India in consideration of the fact that he was serving in a foreign country.

72,291. If the distinctions of title were removed as between Imperial and Provincial, and the pay of officers made the same, it would remove some of the dissatisfaction now existing amongst provincial officers, but the question of the foreign allowance would be a difficult one to deal with. If the pay that a European received in India was a little more than that which he would receive in his own country there appeared to be no necessity for paying any foreign allowance. The grievance might be removed if the European officer received the same salary *plus* a foreign allowance.

72,292. Certain posts in the Executive Engineer grade should be allotted to upper subordinates, if the division into Imperial and Provincial continued, but if there was only one service the proportion of promoted upper subordinates should be left to the discretion of the Government.

72,293. (*Lord Ronaldshay.*) He was drawing the same pay as European officers and he only put forward the complaints in his written statement in the interests of his countrymen.

72,294. (*Sir Theodore Morison.*) At present the provincial service salaries were not adequate to keep up the status and dignity of an engineer. It was true that men came into the service, but for the present they had no other choice. The engineering college was not popular and only a few students entered it.

72,295. (*Mr. Madge.*) He attached a great deal of importance to the passing of an examination, but did not think mere examination was a sufficient test. Recently the system in the Madras college had been changed. Formerly there was an independent board of examiners but now the examiners were the college staff. He advocated a return to independent examiners.

72,296. There were Anglo-Indians in the subordinate service but none in the provincial. So far as he had seen the work of these subordinates, there had been some good and some bad specimens.

72,297. Any foreign allowance given might also be based upon the difference in the cost of living between the two countries.

72,298. There was a risk that, if men were discharged during the period of probation, recruitment would be affected owing to the uncertainty of appointment, but that could not be helped.

72,299. (*Mr. Abdur Rahim.*) He had known of no Madras College Engineer being employed on the railways.

72,300. The Assistant Commissioners, Inspectors and Assistant Inspectors in the Salt and Abkari Depart-

ment had to do a good deal of constructional work for which a knowledge of engineering was required, and a training in the Madras College would help them considerably. They were given some training now in engineering.

72,301. (*Mr. Pears.*) He had heard of no difficulties in securing recruits in England. With regard to training under an Executive Engineer, it was part of that officer's duty that he should allot time for the work. On the whole the training given by executive engineers was adequate, but it might be improved if the probationers were taken over works. That was possible under the present system, but it was not always done.

72,302. With regard to the system of promoting deserving upper subordinates and its failure to attract the best of the available men owing to their being appointed on the starting salary of Assistant Engineers, that was due to the fact that the highest men in the upper subordinate service were getting more pay than they would get at the bottom of the provincial list. Asked whether the college would not become unpopular if the promotion of the officers were retarded, the witness said that if upper subordinates were promoted to a higher class of the provincial service, the promotion of men who came in direct from the college would be retarded to a certain extent, but generally speaking the men in the upper subordinate grade had also come from the engineering college.

72,303. (*Mr. Bhaskara Ayyar.*) From his personal knowledge of the expenses of provincial officers he was able to affirm that the present scale of salaries for the provincial service was inadequate. The pay the Imperial engineer received was just sufficient to enable him to maintain his position. He would not be content with a scale of pay midway between the present pay of the Imperial and Provincial engineers; it was necessary that the pay should be on the Imperial scale.

(The witness withdrew.)

M.R.Ry. N. Swaminatha Ayyar Avargal, Executive Engineer, Madras.

Written Statement relating to the Public Works Department.

72,304. **(I.) Methods of recruitment.**—The method of recruitment followed in England for the Imperial Service of the Public Works Department has not been the same all along. First there were the Royal Engineers who are not being appointed now and have almost disappeared as a class. Subsequently there was the Royal Indian Engineering College at Coopers Hill from where the men required for Service in the P.W.D. were appointed. The College too has been abolished and the method followed at present is appointment by selection by the Secretary of State for India assisted by a Committee. It is too early yet to say whether this method will prove satisfactory; but it appears fairly certain that it is not likely to secure the best talents suited to the requirements of service in this country. Selection on the results of an unrestricted competitive examination in Engineering and allied subjects fixed with special reference to the needs of service in this country and in one Indian Vernacular, so as to secure only persons of proved educational qualifications will be far more satisfactory than any other system which could be thought of and will not be open to reproach as the other methods of selection pure and simple or selection on the results of a competitive examination of the nominated candidates.

In the case of the Provincial Service the method of recruitment was till recently, to appoint the student of the Engineer class who came out first in the examination held by a Board of Examiners, after his completing satisfactorily one year's apprentice course in the Department. This system has been changed and the rules provide at present for a selection by the Principal and the Chief Engineer from among the students of the Engineer class who passed the examination held by the College staff. This latter system is likely to lead to undesirable results as it places the students under the mercy of the Principal of the College and a reversion to the former system which has worked hitherto with such good results is very necessary. If there are any grounds for complaint, they are due mostly if not entirely to the defects in the constitution and working of the College and the unattractive openings held out to passed men about which more will be said later on.

There is also another source of recruitment to the Provincial service by the promotion of deserving Upper Subordinates already in Service at the rate of one in every alternate year. Considering how the prospects of Sub-Engineers have been improved recently, their promotion to the Engineer Establishment on the initial salary of an Assistant Engineer is not at all attractive and as a result of this the whole class of Sub-Engineers have no stimulus to work well and earn this special promotion. Better results will be secured if promotions are made to any class and grade of Engineer Establishment on any salary.

72,305. **(II.) Systems of training and probation.**—As the practical training had in England is not likely to meet the requirements of service in India, the recruits from England should be given two years' practical training in this country under selected Executive Engineers in all kinds of work they will be called on to do. During this period they should gain sufficient colloquial knowledge of the local vernacular. At present their experience is gained wholly while in active service; this not unfrequently places them at a disadvantage resulting in inefficiency and should not be allowed to continue. If any probationer fails to give satisfaction at the end of the period, his term of probation may, at the discretion of the local Government, be extended by another year. His services should be dispensed with if he proves a failure at the end of 3 years. Any plea that this will deter candidates from England by reason of the attached risk may be met by the provision of free return passages to such rejected probationers.

In the case of men appointed locally the training and probation might be limited to one year; but they should be given proper facilities to learn work. At present they are left severely alone and nobody takes care of them. With their own unaided effort they have to learn what is necessary for doing the work of the Department and it is nothing surprising that it takes a longer time than necessary for them to learn and do their work efficiently. Their inexperience is only too readily mistaken for inefficiency. If they are only taken care of properly and proper opportunities are given them to learn work they will prove very efficient indeed in the space of one year. If any probationer fails to do so, his term of probation may, at the discretion of the local Government be extended by another year.

72,306. **(III.) Conditions of service.**—For one work and same responsibility there should be one service with absolutely no distinction of any kind. All officers required to carry out the ordinary work of the Department should be in one list and treated alike in every respect. The special posts requiring specific qualifications should be filled by special men and these latter should not be asked to do the ordinary work of the Department. Also the men appointed temporarily for carrying out specific works should be employed on those works only and their services terminated as soon as they are completed.

Officers should be retired compulsorily when they attain the age of 55 years and the provision for the retirement at 50 of officers not promoted to Administrative grade may stand. Government should also have the power to compulsorily retire any officer at any time for continued inefficiency. Also an officer who finds that his claims for promotion have been continuously overlooked should be given the option of retiring voluntarily.

72,307. **(IV.) Conditions of salary.**—The present incremental system appears to be quite suitable. But

there should be no difference in the salaries of the men appointed to do the same duties merely because they are recruited differently. Any such difference is felt as a great grievance when both do the same work, and what is worse, brands those receiving less, as being inferior. Very often the treatment given to those receiving less pay is also different and to give only a few instance of the same there are:—

(1) The denial of the grant of Presidency Allowance to Provincial officers, when their Imperial brethren are having it, there being no reason for this anomaly;

(2) The way in which the reorganisation of the services was carried out in 1908 failed to give satisfaction to the Provincials and it proved an uphill task for them to get it modified. Even the one recently sanctioned in 1912, though an improvement on the previous one, does not abolish all distinction between the two services. The one main principle to be recognized is that the pay is for the post and not for the man. No difference can be logically maintained without destroying efficiency.

72,308. **(V.) Conditions of leave.**—The duties of a P.W.D. Officer are very onerous and trying and he requires more frequent rest for recruiting his health than any other class of officers. In this respect both Europeans and Indians are alike and there should therefore be no distinction between them. But there is at present much disparity between the conditions applying to each of these two classes of officers.

The maximum amount of furlough admissible at present for Indians is only 2 years and the first furlough can be taken only after 10 years of active service, the interval between any two furloughs being 8 years. It should be possible for an officer to go on furlough after six years active service and the interval between any two furloughs ought not to be more than three years. The maximum amount of furlough admissible should also be increased to $\frac{1}{6}$ of the active service subject to a limit of 4 years.

The allowances during furlough should be half the average emoluments subject to a maximum of Rs. 1,000 per mensem if paid in India and £800 per annum if paid in a foreign country.

Privilege Leave and *Study Leave*.—(The representation under these heads is the same as that in paragraph 72,281 *ante*.)

72,309. **(VI.) Conditions of pension.**—(The representation under this head is the same as that in paragraph 72,282 *ante*.)

72,310. **(VII.) Such limitations as may exist in the employment of non-Europeans and the working of the existing system of division of services into Imperial and Provincial.**—(*a*) At present the employment of non-Europeans is restricted to the appointments made in India and to 10 per cent. of those made in England. This limitation is uncalled for as no irreducible minimum of the European element seems necessary in a Department which is purely a professional and scientific service and has no share in the political administration of the country. The percentage of recruitment made from England for the Madras Presidency during the last 10 years is 70 while that from India is 30 inclusive of those promoted from the subordinate service. Considering the fact that the training imparted in the Indian colleges is sound and fairly exhaustive and is further directed wholly to the requirements of the service in this country and that there is very little to choose between the best Indian Engineer and his English rival, it will be only reasonable to employ local talent to the fullest possible extent without any restriction whatever, by reserving a very great proportion of the appointments for competition in India. The recruitment from England should be limited to

(1) the special posts requiring specific qualifications,

(2) the minimum number of ordinary posts which will enable the filling up of half the number of higher posts in the administrative grade.

This end will, it is believed, be achieved by recruiting from England about one-third the number of men required for the Department exclusive of the special posts, the remaining two-thirds being recruited from the local Colleges. In fact no proportion need be fixed at all regarding the employment of the latter, and what is suggested above is only as a tentative measure.

(*b*) The division of service into Imperial and Provincial which came into force only in 1896 has proved very unsatisfactory and is felt as a great grievance. The lower pay the Provincial draws has lowered him in the estimation of public. Not only this, the Imperials consider themselves superiors, and treat the Provincials as their inferiors. There is thus a distinct line of cleavage between the two, which increases with their service in geometric progression. One of proved merit in the Provincial Service has at present no chance before one of the Imperial Service who is not quite so good. Owing to the unfair treatment accorded to the Provincials and the lack of opportunities to show themselves they come to lose interest in their work and are pronounced as failures. The division of services should cease to exist as soon as possible.

72,311. **(VIII.) Relations of the service with the Indian Civil Service and other services.**—As a result of the division of service into Imperial and Provincial and the consequent differences in pay, treatment, etc., the latter do not command the same respect from the officers of the Indian Civil Service and other services. Consequently they do not move with them as much as they should. An improvement in their relationship is highly desirable and the abolition of the division of service into Imperial and Provincial advocated above will surely hasten it.

72,312. **(IX.) Any other points within the terms of reference to the Royal Commission not covered by the preceding heads.**—The method followed at present in the appointment of Temporary Engineers in the Public Works Department on higher salaries for doing the regular work of the Department is felt as a sore grievance both by the men who have entered service from the way in which their prospects are affected and by those who have passed out of the College, from the way in which their claime have been overlooked for no obvious reason, very often, in favour of others who are not possessed of the same educational qualifications. Too much stress is laid on the value of practical experience and theoretical knowledge which is taken at a great discount in support of the above policy. But its effects are very far-reaching and has resulted in keeping out capable students from entering the College, as their prospects are miserably poor and disappointing, when they fail to come out first.

The recruitment of the Upper Subordinate Establishment employed so largely to assist the officers in carrying out the work of the department deserves to be considered specially in the grade of Sub-Engineers as success is dependent in a large measure on them. The majority of the men who are to do the onerous duties of Sub-Divisional Officers are drawn from this class and it cannot be said at present that they are all able to carry out their duties intelligently and efficiently, as they do not possess the requisite educational qualifications nor do they take pains to improve themselves. It is highly desirable to limit the selection and take in only the promising and deserving men. The deficiency in their number should be made up by appointing the passed Engineer students of the local Engineering College as temporary Engineers and after some years' trial they might either be confirmed as Sub-Divisional officers or done away with. This is not done at present with the result that the capable passed Engineer students first seek employment either in the Local Fund or Native States and those who fail to secure such appointments enter the Public Works Department in a subordinate capacity as temporary Overseers; because there is no scope for employment outside the above services nor can they afford to take up any other line after incurring all the expenditure and trouble in completing this course. Instances are not wanting even among these men leaving the Public Works Department when they are able to secure a place elsewhere. Thus the Public Works Department fails to secure the services of all capable men while it could have the choice and engages only those who are not quite so good and this policy results in the inefficiency of the subordinate service. Government too do not get proper return for the money spent in the education of such students in the Engineering College. If after

securing the capable students as Temporary Engineers, there are still grounds for complaint as regards the quality of men who come out of the college, the proper course will be to alter the constitution and working of the College suitably to meet the requirements of the Public Works Department. In doing so, the requirements of the other allied services, viz., the Local Fund, Municipal and Sanitary, might be considered. For instance a general course might be prescribed to all students entering the Engineer and Subordinate classes for about 2 years or so, and opportunity given in the last year or two to specialize themselves either in Civil, Mechanical, Electrical, Municipal, Sanitary and Road Engineering. There will be then no complaint about the dearth of qualified men for the several services on the one hand and want of scope for the employment of passed men on the other. This latter will in its turn result in attracting capable and intelligent students to enter the College and making the service more efficient. The scope for employing local talent without impairing the efficiency of the services will also be increased.

Travelling allowance.—(The representation under this head is the same as that in paragraph 75,286).

M.R.Ry. N. Swaminatha Ayyar called and examined.

72,313. (*Chairman.*) The witness was an Executive Engineer of twelve years' service, and represented the Provincial Engineers of the Public Works Department. He was trained in the Madras college.

72,314. The present division into Imperial and Provincial branches should be abolished and recruitment in England should be limited to special posts requiring specific qualifications such as Superintendent of Workshops, Electrical Adviser to Government, etc. The remainder of the service should be recruited one-third in England and two-thirds from local colleges. A proportion of the two-thirds recruited in India would come from the subordinate service. Most of the subordinate officers had been educated in the college, and they did not endeavour to improve themselves after entering the service and therefore did not make efficient sub-divisional officers when they attained that rank. They had lower educational qualifications as they had only to pass the school final examination, whereas the qualification for the provincial service was that of graduate. In the college they were trained in separate classes and under separate masters.

72,315. The most successful students in the Engineer class of the Madras Engineering College entered the Public Works Department and the next best went into local services or to Native States. Most of them preferred to go into Native States where they rose to positions of rank and responsibility. If any were left over they entered the Public Works Department in a subordinate capacity.

72,316. He did not agree with the principle that a European serving in India should have an additional allowance in the shape of pay, but he might be given something in the form of first-class passage money to and from England when going on leave or furlough. He would be willing to serve in England himself without any extra allowance provided his passage money was paid. He thought the members of the service would all take that view and would be prepared to serve thousands of miles away from their own home on the same pay they were receiving in India.

72,317. (*Sir Murray Hammick.*) His reason for saying that the new system of appointment was not likely to secure the best talent was that the members of the selection board were not likely to know intimately all the merits of the candidates who appeared before them. He knew nothing about the method of selection in England, but thought that the selection board would be able to judge the men properly. When the number of candidates was so large it was impossible for a committee to obtain any intimate knowledge of them. Further, the men were drawn from several institutions no two of which had a common standard.

72,318. With regard to his remarks in the written statement on the subject of selection by the Principal of the College and the Chief Engineer, the difficulty was that the student had a suspicion that if he offended the Principal he might not have the same chance. It might not be a justifiable suspicion but it acted on the student. The Chief Engineer was generally swayed by the recommendation of the Principal and there was a suspicion that intelligence and merit might not obtain their reward. He himself apprehended no unfairness but the suspicion was there.

72,319. At present he was drawing Rs. 630 a month. He did not consider any extra allowance would be necessary if he were appointed to serve in Peshawar.

72,320. (*Mr. Abdur Rahim.*) The apprentice in the engineering department was simply attached to a division under the orders of an Executive Engineer. He was allowed to learn what he could by going about the place, and taking notes which he submitted every three months. No remarks or orders were passed thereon. The engineer under whom the apprentice was placed did not give him any instructions. He did not know how the English probationer was treated, but he did not suggest there was any difference in the manner in which the two classes of probationer were trained.

72,321. In his opinion an apprentice should be made to do the work of a sectional officer for some time, to inspect large works, and to take notes of them with the help of the officer who might be in charge. At a later period he should be given the charge of a sub-division.

72,322. The travelling allowance of an apprentice engineer was sufficient; he received Rs. 3 per day and first-class fare.

72,323. (*Sir Valentine Chirol.*) He had never served out of the Madras Presidency. He had never been to Peshawar, but he had friends there. They had not told him what the conditions were. He would not claim any extra allowance merely because he was sent to a foreign district.

72,324. (*Mr. Madge.*) He did not think the British element was at all necessary in the service.

72,325. (*Mr. Chaubal.*) If he served in Peshawar he would take his wife and children with him. When his children were old enough he would send them back to Madras to be educated. That would mean more expense to him than if he was appointed to the Madras Presidency, and he would expect some allowance to be made. This allowance should not have anything to do with pay.

72,326. With regard to travelling expenses, he would expect to receive travelling allowance for himself and his wife and children.

72,327. (*Lord Ronaldshay.*) He suggested that an Indian vernacular should be a necessary subject for engineer officers recruited in England in order that such men could show their attitude or otherwise, for learning the vernacular. He admitted it would be rather unfair to an English engineer officer who was not successful in the competitive examination to have been obliged to spend a large part of his time in learning a language which would clearly be of no use to him in his later life, but he pointed out that Indians, who would compete with the English officer, were also under a similar disadvantage in having to learn the English language. At the same time he agreed that a knowledge of English would be of advantage to an Indian engineer even if he failed in his examination. He had not viewed the matter in the light that if a knowledge of the Indian language was insisted upon as one of the subjects for the competitive examination, it would deter English engineers from entering the examination.

72,328. (*Mr. Pears.*) Passed-out engineer students of the Civil Engineering College preferred Native States to local funds.

72,329. (*Mr. Bhaskara Ayyar.*) He did not mean to suggest that the present system of selection was badly exercised. What he meant to say was that, however fair a Principal might wish to be, it was impossible for him to avoid an unconscious prejudice, arising from the circumstances that he had known the students in his college, and had formed some impres-

sion about them. If one scale of pay was made common to all the Provincial and Imperial engineers, and the Imperial engineers were given a foreign allowance, and the recruitment of Indians was increased, the discontent of the Provincial engineers would not be in any way mitigated. There must be absolute equality in pay, and also a larger recruitment in India.

(The witness withdrew.)

W. H. James, Esq., B.Sc., Principal, College of Engineering, Madras.

Written statement relating to the Public Works Department.

72,330. [The undersigned is not a Public Works Department Officer and can express no opinion based on actual experience in regard to the conditions of service in the Public Works Department but, as principal for some years past of the institution from which a great majority of men employed in the Department are drawn, is closely concerned with the subject of recruitment.]

ENGINEER OFFICERS.

Recruitment in England.—No information is available as to the considerations that influence the Secretary of State's Advisory Committe in making appointments to the Public Works Department cadre, but I would, in any case, advocate that no engineer should be regarded as eligible for service in India unless he has had at least two years' practical experience in workshops or on Engineering works, in preferably some subordinate position and not as a premium apprentice. The longer this practical training up to a limit of say four years, concomitant with his having pursued a thorough theoretical course, the better fitted I should regard the candidate for employment in this country. There should also be a real and effective period of probation for two or three years before confirmation as a permanent officer.

Recruitment in India.—This is a matter of very great importance, for, India like all other countries, must in this mechanical age come to depend more and more for her progress and development on technical and in particular on Engineering skill, and whatever is possible should be done to foster indigenous talent.

The provision of adequate and up-to-date facilities for preliminary theoretical training is naturally called for in the first place, but the creation of well-qualified and practical class of experts is only possible if those Indians, who take up Engineering work, are encouraged in every way and given full scope for exercising their projession.

It can hardly be denied that, in general, the best brains of the country are at present drawn to seeking careers away from technical work. This, perhaps, is due partly to there having been no tradition in the past leading the higher and more intellectual classes to the study of applied science, but a greater present bar is the limited opporunity afforded in connection with Engineering work, and also the much larger prizes to be won in other walks of life.

For admission to this institution the general educational qualification demanded is of the standard of the Intermediate Examination in Arts of the University of Madras with Mathematics and Physics as the chief subjects. Selection from among the candidates is made by the Principal on the University examination records, and the students after admission pursue a college course extending over four years, followed by one year in workshops or on engineering works. After the first two years, the course bifurcates, and the students elect to qualify either as civil or mechanical engineers.

One appointment as Apprentice Engineer in the Public Works Department is conferred annually by the Chief Engineer, Public Works Department, in consultation with the Principal, College of Engineering, on the student, either civil or mechanical engineer, judged most suitable on the results of the examination and the promise shown by him and his general behaviour during the college course. The Apprentice Engineer is brought on to the permanent establishment of the Public Works Department as an Assistant Engineer at the end of the year of apprenticeship.

So far as Madras students are concerned, this is the only appointment open in the Engineer Establishment of the Department. The Government Order sanctioning the first regular and annual appointment of this kind is dated as long ago as May 14th, 1872, when the number of officers serving in the Public Works Department was naturally smaller than at present, and the question might very well now be considered whether something cannot be done in this direction.

I am myself not particularly in favour of appointment direct from College and would prefer selection should be made from among the three or four best students of the year after a probationary period of say two years in the Department. Selection might still remain with the Chief Engineer in consultation with the Principal of the College, based as at present on the results of the examinations and promise shown during the college course, but together with the further information that would then be available in regard to the aptitude shown by the probationers for practical work.

I would throw open more appointments in the Superior Service to men selected under such conditions, so that they may be afforded ample opportunities to show their worth, but promotion to the higher executive grades should be strictly on merit and not a mere matter of seniority. Men who after some years are regarded as unfit for promotion should be asked to resign and to allow of this being done without a suggestion of hardship, they may be granted some kind of retiring or compensation allowances with liberty to engage in other work.

UPPER SUBORDINATE OFFICERS.

Some appointments to the Engineer Establishment are made from among the Upper Subordinates. The College training of the subordinate is appreciably lower in standard than that of the Engineer student. The educational qualification for entry is the equivalent of Matriculation, and our present system is to admit the student in the first place to what is termed the Probationary Subordinate Class. Selections are made after two years from among the students of this class for promotion to the Upper Subordinate Class for a further course extending over two years, followed by a year of practical training in the Public Works Department. The unselected pass out at the end of the third year as Lower Subordinates. This arrangement, which really constitutes an attempt to improve the type of Upper Subordinate by obtaining men who at least show some promise in elementary engineering studies, was only introduced a few years back, and it will take some time to judge the results with any certainty.

After some service in the department, the more capable of the subordinate officers are offered promotion to the grade of Assistant Engineer, but this should come sufficiently early to make acceptance of some material advantage. I would not be in favour of increasing the number of promotions from that class.

Mr. W. H. James called and examined.

72,331. (*Chairman.*) The witness had occupied his present position for over six years. He had been in the service for twelve and a half years. He was appointed to the professorship of engineering when he first came out in 1901, and remained in that post for about six years.

72,332. The course of training now given at the Madras college was adequate for officers of the superior grades of the service, but it could be made better. Government had now a large scheme under their consideration, and provided that scheme was accepted, and the requisite staff and equipment were

provided, the training at the college would be considerably improved. There were 382 students at the college. There were also other students undergoing practical training, making a total number of 435. One hundred and twenty-five students were in training in the classes of the provincial service standard from which number one was appointed to the higher service every year. Of the remainder, 50 per cent. accepted appointments in the subordinate ranks of the Public Works Department, 25 per cent. went into local funds, 10 per cent. went with the Native States, and the rest took up various appointments. There were very few openings in private firms in Madras.

72,333. The pupils under training for the subordinate service were kept quite separate from those under training for the provincial service. Students who contemplated entering the provincial service underwent a higher course of training than those who contemplated entering the subordinate service.

72,334. There were no residential arrangements at the college. Students had facilities to go to the Victoric hostel with pupils of other colleges.

72,335. The present method of training for the upper and lower subordinate services was to admit pupils to a probationary subordinate class. After two years in that class, selections were made for a further course of three years, to qualify students for the upper subordinate branch. Those who were not selected stayed an additional year, and then entered the service as lower subordinates.

72,336. The students in the engineer class entered the college after having gone through the intermediate course, and naturally the college was able to train these students up to a much higher standard. The qualification for entry for pupils intended for the subordinate service was the matriculation or school final.

72,337. He was not in favour of the suggestion that in view of the very small recruitment to the provincial service each year in the various provinces, it might conduce to efficiency of training and possible economy if all the students entering the provincial service were trained at the same college. In the first place India was much too large a country, both in point of area and of numbers, for a college of that kind to serve the purpose intended. Nine or ten men each year were taken into the provincial service, and for classes of that standard, not more than twenty-five students in a class could be properly dealt with. If there was a central college of the kind suggested it meant there would be a class of twenty or twenty-five students, from which nine each year would be selected and put into the Imperial service. In his opinion Government would not get so good a selection by that method as if the appointments were distributed amongst the existing colleges. A college in each of the major provinces was absolutely essential,—apart from any considerations of recruitment for the provincial service. The training given to students who contemplated entering the subordinate service would not suffice for the 35 per cent. of men who were taken into the local funds and Native States. The latter required the same training as provincial engineers. He would also point out that difficulty might arise in getting the best men from Madras to go to a central college, as they might not desire to leave the presidency.

72,338. He regarded it as very important to give every opportunity to Indians to become thoroughly trained, because he considered that as engineering works developed in India, as much indigenous talent as possible should be employed. Therefore he was anxious to see each of the provincial colleges brought up to the highest possible standard. He would throw open more appointments in the superior service to Indians trained in India. At present the figure was 30 per cent. He would prefer to see the 10 per cent. of Indians now recruited by the Secretary of State in England recruited in India by local governments.

72,339. The course at the Madras college lasted four years, with one year on works. That was a year more than Rurki. Therefore, Madras college naturally thought its curriculum was a little more advanced than that of Rurki. He could not put in a return as to the difference between the two curricula, as Rurki college did not publish their syllabus in the calendar. He thought it was necessary to have a fourth year. From the experience he had obtained of work in India, he had himself advocated the lengthening of the period. The four-year course had only been in vogue two years, and the results of the change were not yet available, but he believed the extra year would effect a great improvement. The reason for the extension was that formerly students in the Madras college were accepted after they had passed the B.A. degree. They came in up to the age limit of twenty-two and he found they were rather old to start engineering. Therefore the qualification had been cut down to the intermediate, and the course lengthened, in order to give the students an additional year of special training. Students at present were taken in up to twenty years of age.

72,340. Although he was not in favour of increasing the number of promotions from the upper subordinate service to the superior service, he certainly would have no objection to promoting an exceptional man.

72,341. He did not suggest any improvement in the training for subordinates.

72,342. At present the Madras college gave a very inadequate workshop course. The surveying work was carried out very satisfactorily, because students were given a month in the field. What was chiefly wanted in the college were workshops and laboratories.

72,343. He would not suggest sending Indian students to England after they had been turned out of college; he would after the period of practical training put them straight into the service.

72,344. (*Lord Ronaldshay.*) No Madras college students went into the Telegraph Department. They were given instruction in electrical engineering, but the college had only just started a course in that subject, and their great desire was to increase the laboratory facilities in order to give proper instruction.

72,345. Students who had passed the regular course of the college were as efficient theoretical engineers as students who had passed through a course in an English engineering college.

72,346. (*Sir Theodore Morison.*) The longer the period of practical training the better, but students who were getting on in years desired to earn money at the earliest possible moment.

72,347. With regard to the opportunities for practical training which were given to pupils who did not get into Government appointments, all the upper subordinate and engineering students who left the Madras college received a year's practical training, during which time they were paid a maintenance allowance. Those who went into Native States also received the same training.

72,348. Although he would like to see recruitment confined to Indian colleges, he would not absolutely exclude those Indians who had been trained in England.

72,349. (*Mr. Chaubal.*) There could not be the same facilities in India for learning electrical engineering as there were in England, but it was quite possible to equip Indian colleges to give a good enough training in that subject. There were at present no facilities in the Madras college for teaching telegraphy.

72,350. (*Mr. Sly.*) Engineering students in the Madras college were charged Rs. 140 a year. That sum was paid by the students themselves. There were for each class division two open Madras Government scholarships, and a third for which Muhammadans, Indian Christians, Eurasians or Europeans had a prior claim and there were a number of students holding scholarships from Native States. The one year's practical training had to be undergone before a student obtained his degree in engineering. The University laid down the condition that the student must have been on works for one year before being admitted to the degree. The Madras college insisted on the student going through a year's practical training under the supervision of Public Works officers of the Madras Government. All the upper subordinates and engineering students were posted to the Public Works Department for one year. The one year's probation which a man had to undergo after leaving the college was in addition to that.

72,351. The student's position on the list at the final examination did not depend on the written test at that examination, but on his work right through the course. There was a separate examination for the University degree. The college course had nothing to

do with the University except that attendance qualified for admission to the University examinations. The college diploma certified a man for employment.

72,352. (*Mr. Madge.*) Apart from maintaining a British element, he was desirous of improving the standard of training in India to such a high degree that recruitment would mainly take place in India. He was pretty familiar with the conditions in England, and he saw no reason whatever why the engineering training in India should not be as good as that in England.

72,353. (*Mr. Abdur Rahim.*) Practically none of the Madras college students were employed on railways. He did not know the reason for that. Several efforts had been made in that direction, but they had all been unsuccessful. No specific reason had been given. The training received at the Madras college would fit a student for theoretical railway work, but he would need a little practical training.

72,354. (*Sir Valentine Chirol.*) There was very little difference of standard between the one man who was fortunate enough to get into the provincial service, and the best of the others who failed. The students highest up on the list who had just missed the provincial service appointment, usually went to local funds or Native States as assistant engineers. Those on the lower half of the list usually obtained employment in the Public Works Department.

72,355. (*Sir Murray Hammick.*) The men who went into the local fund employ had received the one year's practical training in the Public Works Department. They went into the local fund as assistant local fund engineers, with a prospect of becoming local fund engineers. That was a career which, in Madras, led to something between Rs. 400 and Rs. 900 a month.

72,356. Students who came from the Native States with scholarships usually applied to the Native States for employment, and they were taken on as opportunity offered. The Native States continually applied to the college for men, but for the higher appointments the students themselves usually put in their applications. Last week he had had an application from a Native State for eight engineers, but there were no men available. If the new scheme which was before the Government of Madras was carried out, and the college was enlarged, there would be ample employment for the increased number of students turned out.

72,357. (*Mr. Bhaskara Ayyar.*) The training of the Civil Engineer in India was quite as good as it was in England. It was not possible to obtain experience of irrigation work in England.

72,358. He was not in favour of the direct appointments of passed students from the college to the service; he preferred a period of probation. He did not mean that they should be appointed on probation, but he would select three or four students, make them them undergo a period of probation, and then make a final choice from amongst those three or four. His idea was that they should all serve in turn under the same officers.

72,359. With regard to his statement that after the practical training was over, the Chief Engineer and the Principal should select the candidate to be appointed, he did not say anything about the Principal being able to judge a man's fitness during the practical course except from the reports received, but what he did maintain was that the Principal, having known the student for four years, and carefully watched his career during that time, would be in a favourable position to form some opinion as to his ability and character. A pupil's character was not likely to be altered during the period of practical training.

72,360. He meant exactly what he said, when he stated that owing to there having been no tradition in the past leading the higher and more intellectual classes to the study of applied science, it was not quite popular in India. He admitted that there had been engineering works constructed in olden days.

72,361. (*Chairman.*) His suggestion was that after the completion of the college course the three or four best students should be placed in turn under the same officers in the Public Works Department. He would place each one under an officer, and change them about, so that all four would in turn have been under the same men. The officers would then write reports about each of them, and the Chief Engineer would be able to judge who was the best man. He was not particularly keen about acting as selector with the Chief Engineer, but he would know more about the student than anybody else. The appointment was always in the hands of the Chief Engineer, and not in the hands of the Principal of the college. If two men were equally good, and there was only one vacancy, the claims of the man who was not selected might be considered in the following year.

(The witness withdrew.)

At Bombay, Saturday, 21st February, 1914.

PRESENT:

THE RIGHT HON. THE LORD ISLINGTON, G.C.M.G., D.S.O. (*Chairman*).

THE EARL OF RONALDSHAY, M.P.
Sir MURRAY HAMMICK, K.C.S.I., C.I.E.
Sir THEODORE MORISON, K.C.I.E.
Sir VALENTINE CHIROL.
ABDUR RAHIM, Esq.
WALTER CULLEY MADGE, Esq., C.I.E.
FRANK GEORGE SLY, Esq., C.S.I.

And the following Assistant Commissioners:—

R. J. KENT, Esq., Superintending Engineer, Bombay.
J. H. ADVANI, Esq., Executive Engineer, Bombay.

R. R. SCOTT, Esq. (*Joint Secretary*).

H. F. BEALE, Esq., Chief Engineer and Secretary to Government in the Public Works Department, Bombay.

Written Statement relating to the Public Works Department.

72,362. [NOTE.—When opinions upon controversial matters are expressed in the present memorandum, or preference shown for any particular line of action, it must be understood that I speak for myself, and not as the mouth-piece of Government. I also demonstrate as far as possible the wants of the various sections of our department, and make remarks on them from the point of view of my position in the department.]

72,363. **(I.) Methods of recruitment.**—In common with many other Engineers I regret the abolition of Coopers Hill as the training establishment in England for the Indian Public Works Department. But I think the Selection Committee at home seems to be doing its work very well on the whole, and the men recruited as Imperial Engineers are nearly all talented and well trained. A weak point in this system of selection however—and it hits our department very hard—is that the Committee have no means of gauging the tact and the qualifications of the candidates in the management of men, nor have they any sure method of examining their manners and temper. A man, who has to be in residence at a college for three years, learns, before he goes out into the world, some valuable lessons in the art of forbearance and companionship, and if he has rough corners they are knocked off by raily contact with men of his own age, approaching the period when they must become entirely self-dependent and responsible members of society. The spirit of comradeship survives in the case of most of the college men, throughout their service in India. A man selected by the Committee may have no such experience, and may be absolutely ignorant of the conditions of public life or service. It is important that the right stamp of man should be chosen, as far as the present system allows, and I

think the aid of two or three Public Works Department Engineers, retired or on furlough, would be a very useful addition for the purpose to the Selection Committee.

The Provincial Establishment which was sanctioned in 1892, and came into being in 1896, is recruited from the College of Engineering, Poona, one man in each year, and from the ranks of Upper Subordinates one man in every 2nd year. The ultimate strength of the Provincial Service in the Bombay Presidency is supposed to be 30 men. The recruitment is satisfactory, except that it is now felt that Upper Subordinates should be promoted to the Provincial Service, before they have served very long as subordinates. The Public Works Code directs that men should be selected as a rule from the Sub-Engineer grade and only very exceptionally from among the Supervisors. There are various objections to this:—

(i) It is no pecuniary benefit, and may be a loss to a man to be thus promoted.

(ii) He is too old to rise above junior Executive rank, even if he gets as far.

(iii) He has lived himself into the subordinate groove, self and family, and is like a fish out of water in the new circles to which he is then raised: a trial to the men he has to associate with, and too often in a very uncomfortable position himself.

Whereas early promotion is a rapid reward for energy and brilliance, and the man promoted has the best part of his life before him.

As a reward for the senior subordinates (Sub-Engineers) I suggest that a grade of Deputy Engineer be instituted with a rise of Rs. 100 in pay. At present a Sub-Engineer may get Rs. 500 maximum + Rs. 30 Sub-divisional allowance; the Deputy Engineer should get Rs. 600 + Rs. 30.

A third form of recruitment is the appointment of R. E.s. If they are drafted in at the bottom of the department and rise with their Civilian colleagues, there can be no objection to their appointment. If senior men are drafted in, they should not take precedence of men of their own age; but even then it will be a hardship to the juniors unless an increase in the cadre is sanctioned at the same time.

The same argument applies to taking temporary covenanted men on to the permanent establishment. The Secretary of State decided* that such men (duly selected for their efficiency) should be graded one year below the permanent men they came out with, but still such appointments are felt as a hardship by the permanent men, unless there is an increase in the cadre to absorb them.

The general recommendation, therefore, is not to take temporary men on to the permanent establishment; but it would be wrong and inexpedient to make this a hard and fast rule.

72,364. **(II.) Systems of training and probation.**—At present when a man has had one or two years' practical training in England before selection he is appointed at once as a permanent member of the Department, but if his training has been short he is sent out on probation for a year. I doubt much the value of this probationary period, except perhaps that it makes a man buckle to from the start. A man's character can be gauged during the period, but it is always a difficult and disagreeable task to get rid of an officer (even on probation) unless he is really bad. A stigma must necessarily attach to any such discharge, except on the score of health. The training at home is now principally useful in giving a man an idea of public life and responsibility.

The Provincial Engineer appointed from the College in India is differently placed. He is engaged as an Apprentice for a year, and then confirmed, if good. This year is really a period of training and probation in one, and it cannot be abandoned. Of course men from the subordinate ranks are not put on probation when promoted to the Engineer establishment.

72,365. **(III.) Conditions of service.**—The permanent cadre of the Bombay Public Works Department is insufficient, but an application for increase has been refused by the Government of India (letters attached†). We have 106 permanent and 28 temporary men.

I attach a statement† showing the recruitment year by year from 1880 to 1913. I submit that spasmodic recruitment, as shown periodically therein and particularly in 1907, 1908 and 1909, is essentially wrong, unless the men are appointed in various ranks, so that they may retire in succession. The Government of India have stated* that uneven recruitment will not produce a block, because they are able to correct any redundance of officers in one rank by an annual adjustment of the limiting scale. I regret that I do not know how this is done, but hope it may come into use when the men of 1907—1909 rise to the senior grades. At present they are on the annual increment system, but if Executive Engineer charges are not available for them when they reach that rank their increments will have to be withheld. When they have 20 years' service only a few will be accommodated in the administrative ranks, and our department has very few outside appointments indeed to look to.

What the Bombay Government has asked is that we may be allowed to look ahead and commence recruiting steadily at once for an increased cadre. Meanwhile if we want older men to fill up the increased establishment we can appoint them (without injustice) against the greater cadre to be sanctioned and they will retire leaving places for the younger men to fill.

The staff required for construction is always greater than the maintenance establishment. So it must be perfectly safe to work up to the latter limit the moment any project is sanctioned (or even likely to be sanctioned, because recruitment is always very slow and can if necessary be stopped, if it should happen that a promising project is suddenly rejected).

The balance of men required, over and above the sanctioned cadre of permanent officers, must of course be temporary men, but these should not be more numerous than can be helped. The cadre must be constantly checked and revised. If properly done the revision will always take the form of an increase in numbers; if carelessly done there will be fluctuation, sometimes more, sometimes less.

Article 650 of the Civil Service Regulations provides for the compulsory retirement of all permanent Public Works Department officers at 55 years of age. This is a suitable provision. Article 649 provides for the discharge of officers at 50 years, who are not of administrative rank and are considered unfit for it. But a further provision is necessary. It should be possible, without positive cruelty, to discharge at any time men who are incompetent or lazy, and definitely proved to be so by the successive report of three different officers. I think a bonus should be given to them. This bonus might be, for example, $\frac{1}{3}$ to $\frac{2}{3}$ of a contribution Government might make at the rate of 75 per cent. of the deposits of the officer in the Provident Fund. No definite amount should be fixed. This may apply equally to Imperial, Provincial and Temporary Engineers.

With regard to the last it is thought that for two reasons better terms should be offered than at present because

(i) they will attract better men, and

(ii) Government will have some hold over the men.

The following arrangement might be adopted:—

The terms already offered to some covenanted men should be offered to all temporary engineers. All the new men have been directed to subscribe $9\frac{3}{8}$ per cent. of their salary to the Provident Fund. Government should add to this half yearly 75 per cent. of the subscription, the sums to earn $3\frac{3}{4}$ or 4 per cent. compound interest.

In case of misdemeanour the Government contribution would be withheld and in case of inefficiency, followed by discharge, the Government contribution might (as explained above) be partially withheld.

In no case should a permanent Engineer be allowed to claim any bonus for voluntary retirement before he has earned his first pension, and after he has earned his pension there will no more be any question of bonuses.

The temporary Engineers desire† that the one month's notice on either side should in future be changed to three months' notice. This is a reasonable request.

72,366. **(IV.) Conditions of salary.**—The increment scale of salary, introduced in 1908, and modified

* *Vide* Government of India, Public Works Department, letter No. 842-E., dated 2nd August, 1906 (Annexure 5 on page 174).

† *Vide* Bombay Government Memorandum, Appendix XVI.

* *Vide* Government of India, Public Works Department, letter No. 1463-E., dated 3rd November, 1905 (Annexure 4 on page 174).

† *Vide* Annexure 4.

in 1912 as regards the Provincial* Service, while giving better pay generally, at the same time abolished as usual the exchange compensation allowance.

The cost of living is generally on the rise, and if on this account the pay of other departments is to be increased the Public Works Department should share. That the present scale is by no means high is shown by the fact that Engineers are very much averse from serving in Poona, where they cannot save at all, and in Bombay, where they perforce must run into debt.

There are one or two cases, which require consideration independently of a general increase all round—

(*a*) The two Chief Engineers who are Secretary and Joint Secretary to Government have to migrate with Government and as heads of their department have to do a great deal of entertainment. They are not like other Secretaries comparatively junior men, about half way up the ladder, looking forward to much higher emoluments, but they are the senior men of the department enjoying, as far as may be possible, what looks on paper like high pay, compared with the men next below them. Their responsibility extends over the whole department in the Bombay Presidency including Sind and Aden. The joint Secretary gets a house allowance in Bombay, the Secretary does not. It is suggested that their pay should be—

Rs. 2,500 as Chief Engineer,
+ Rs. 500 as Head of the department in either branch,
+ Rs. 250 for Joint Secretary's duties, without house allowance.
and + Rs. 500 for Secretary's duties, without house allowance.

Thus the senior man would draw Rs. 3,500 (which is not more than the pay of the Commissioner† of a division in Bombay) and the junior man Rs. 3,250.

(*b*) The Government of India have already been addressed‡ upon the necessity of granting a Presidency Allowance to the junior Public Works Department officers in Bombay itself, *viz.*, Rs. 250 for Executive and Rs. 150 for Assistant Engineers. It is hoped they will sanction this now, for the reasons given in the Government letter, as it is a very urgent want.

(*c*) There is an order that an Executive Engineer not holding a district charge should not draw over Rs. 800 (Imperial) or Rs. 535 (Provincial). Unless the officer is unfit for an Executive Engineer's charge this seems an unfair restriction, as the fault is not his that there are no vacancies, and I consider it would be fair to permit him to draw his increments as they become due.

(*d*) There is an order that if a man is reported unfit for Executive Engineer's charge he should draw the pay of an Assistant Engineer only, *i.e.*, Rs. 750 (Imperial) and Rs. 475 (Provincial). I suggest that he should come under the previous rule that Rs. 800 and Rs. 535 should be the limit but that if he continues to be a good sub-divisional officer he should get two increments at 5 year intervals of Rs. 50 each as compensation for not being promoted to the charge of a district. (A Provincial Executive Engineer debarred from administrative rank is compensated, if he is a good Executive, by an increment of Rs. 50, and I think a second Rs. 50 should be added in his case also.)

At present, the rule as it stands is very unfair indeed upon Provincial Engineers promoted from subordinate rank for special ability, if they are not sufficiently expert to hold charge of a district. Such a case actually exists in our department, and the officer in question draws less than he would have, had he refused the honour of promotion to the Engineer establishment. It is a very great hardship for a man who has done excellent service for the State. He is debarred from rising above Rs. 475, and my suggestion is that he should be drawing Rs. 535, *viz.*, only Rs. 5 more than a Sub-Engineer, 1st Grade, and that he should be allowed two increments at 5-year intervals up to a maximum of Rs. 635. The latter figure, it will be noticed, is only Rs. 5 more than the pay I suggest for Deputy Engineers.

In the matter of pay, I have a representation* from the temporary Engineers that, compared with permanent men occupying the same posts, they should be given 10 per cent. more, because of the precarious tenure of their appointment, and the fact that after some years of work in India they are virtually precluded from obtaining work elsewhere. Also, they request that some further addition should be made to compensate them for earning no pension. They suggest that regular increments should be given on the same basis as for the permanent men, and all their allowances.

The whole demand is a natural one, but I doubt if Government would be well advised to accede to these requests. Temporary Engineers are obtained in the open market; there is no fixed scale of pay for them and there is no particular reason why Government should bind themselves down to give increments. Each man has to be treated on his merits. I think, however, it would be right, and wise, too, if Government were to contribute towards their Provident fund, as already explained under III. (paragraph 72,365). This would meet part of their demand.

Certain Engineers who have been given permanent appointments in the Imperial Establishment, ask† for a reconsideration of their position on the seniority list. They were older, when selected by the Secretary of State, than the usual run of men appointed to the Public Works Department, and they came out on a 5-year covenant, they were all graduates in Engineering, and had 2 to 8 years' training at home. They were made permanent at or before the expiration of their covenant, and were then placed a year or 15 months below the permanent men who commenced their Indian career at the same time, and are thus 3 to 7 years' older than the latter. Their request is to be placed in a position more suited to their age and experience, and they contend that because the incremental system has been introduced, and because the promotion to Superintending Engineer rank is done entirely by selection, no permanent man will suffer any hardship by their advancement. I sympathise with these officers, but must explain that the Government of India pointed out (when the matter was under discussion) that it was a great concession to temporary men to make them permanent. Though these officers were more or less obliged by circumstances to take whatever terms were offered, yet they must realise that when first sent out to India they had already passed the age at which they were eligible for the Indian permanent establishment, and they secured entrance only by virtue of coming out on a short covenant. Again though selection is the rule for the administrative ranks, yet among men nearly equal the senior officer must be chosen, and hardships would result.

72,367. **(V.) Conditions of leave.**—The leave rules are now being revised by the Government of India, and they will be very much improved. I think no difference should be made between the various Imperial Services; at present there are one or two small differences.

Provincial Engineers come under the Indian Service rules, and these are also being improved.

Temporary Engineers appointed in India may have privilege leave, if no extra expense is incurred thereby. Those who are appointed by the Secretary of State may have privilege leave, and also sick leave up to six months, the latter on half pay, or as a special case, leave as admissible to the Provincial Service.

The temporary Engineers have asked to be brought under European Service rules, and that leave due should be given even after discharge. They also ask for proportional furlough, if discharged before 8 years' employment.

Perhaps some concession may be recommended such as the following:—

For Europe-trained Engineers European leave rules, and for India-trained Engineers Indian leave rules, after three years' continuous service; also privilege leave due up to a limit of three (or six, if the new rule be that) months may be given after discharge, but not furlough.

* For the Imperial Engineers the two periodic increments of Rs. 50 admissible to Executive Engineers, 1st grade, were abolished (Rs. 1,250 maximum), but for Provincial Engineers a special increment of Rs. 50 was sanctioned (850 + 50 = 900) after 5 years if not promoted to administrative rank.

† The pay of Commissioners of Divisions in the Presidency proper is either Rs. 3,000 or Rs. 3,500 per mensem and that of the Commissioner in Sind is Rs. 3,750 per mensem.

‡ *Vide* Bombay Government Memo.—Appendix No. XVI.

* *Vide* Annexure 2, page 173. † *Vide* Annexure 3, page 173.

A most important point is the question of furlough pay. Indian Civil Service and Military Officers in civil employ draw a minimum furlough allowance of £500 or full pay if less, and a maximum of £1,000 a year. The Imperial Engineer begins on about £280, and after 18 years' service is still below £500, while his maximum, viz., £800, is reached in about 30 years.

It is evident, then, that nearly throughout his service he does not draw a living wage while on furlough. The result is that most officers not only absorb their small savings in the short periods of furlough they venture, or are obliged to take (for considerations of health, putting children to school, etc.), but very frequently run into debt. They should be treated like the other Imperial Officers, having like needs.

The Provincial Officers get very much less pay (their furlough allowance is half their salary), and could not be expected to take much home leave, but furlough in India is not expensive. However, they wish naturally in this, as in all other respects, to be placed on a par with the Imperial Engineers.

The Bombay record shows that Indian Officers (both Provincial and Imperial) do not take much furlough as a rule. Of Indian Officers in the Public Works Department twenty have over 10 years' service and eight have over 20 years.

Those who have taken furlough are on the Imperial list; one, with 31 years' service, has had 3½ years' furlough, and four others have had between 1 and 2 years.

Study leave, such as is granted to the Indian Medical Service, would be a useful concession to Public Works Department men. At present they can be put on deputation for a definite purpose, during which they may draw pay at two-thirds of their salary.

72,368. **(VI.) Conditions of pension.**—The pensions of Engineers are so small that it is difficult to think how retired officers can exist at home. The pension fixed in 1864 was Rs. 5,000, and is still that, but in those days the equivalent was £500, while now, 50 years later, it is £437½.

The pay drawn is too low to permit of appreciable savings, and the small savings are soon eaten up by any furlough that may be taken on the allowances referred to in V. above. At the end of 30 years' service an Engineer without any private means is very badly off, unless he is a bachelor. A married man must make provision for his wife and family, so cannot risk much by insuring for an annuity as an addition to his pension. His Provident Fund, even with 10 per cent. contributions, is at best a comparatively small figure.

In pensions it is the maximum limit imposed which hits the officer. The Civil Service Regulations provide that a man shall get thirty-sixtieths of his pay as pension after 25 years' service or over, but he is limited to Rs. 5,000 as Executive Engineer and Rs. 6,000 as Superintending Engineer. In the first case the calculation would give Rs. 7,500, and in the second Rs. 10,500, so the limits imposed involve a very heavy reduction.

The Imperial Service officers have represented their case to the Government of India and Secretary of State more than once, and only desire to be brought on a par with the other Imperial officers, Civil and Military. For the Provincial Service the pensions are the same as for the Imperial, but it appears that the concession as regards Superintending Engineers' and Chief Engineers' pensions will only be granted under very special condition (Article 636, Civil Service Regulations).

It may be interesting to compare the retirements and casualties between European and Indian officers. Taking the period from 1894 to 1913, 20 years:—

Number of officers who	Europeans.	Indians.
Died while in service	17	8
Retired before 55 years of age	32*	5
Retired on pension at 55 or over ...	20	6

* Includes 7 resignations before earning a pension.

The retirements of the Europeans before reaching the age limit is a contrast to the Indian figure.

72,369. **(VII.) Such limitations as may exist in the employment of non-Europeans and the working of the existing system of division of services into Imperial and Provincial.**—The Bombay Establishment consists of:—

—	Imperial Engineers.	Provincial Engineers.	Total.
	81	25	106
Europeans	65	—	65
Indians with English training ...	6	—	6
Indians with Indian training ...	9	22	31
Europeans trained in India ...	1	3	4
Proportion { European	66	3	69
Proportion { Indian	15	22	37

The high proportion of Indians, in the first column, is due to the annual recruitment of 2 men from the College of Science in Poona for some years. A proportion of 10 per cent. Indian Engineers from Europe is sufficient for the present, but should be considered a limit dependent upon thoroughly qualified men being available. This view, however, is not supported by the Imperial Indian members. The point they probably lose sight of is, that in the Provincial Section Government will always have an overwhelming majority of Indians, and when the Provincial Service contains the proposed limit of 30 members, there will still be about 40 Indians in the whole cadre. To claim more than 40 per cent. would be unreasonable, and would involve a serious diminution in the efficiency of our department. I will show separately* how this heavy percentage already handicaps us.

The existing division into Imperial and Provincial seems quite suitable, and now that the men are on the same list for promotion, and the districts are interchangeable, it can in no way be said that the official status of one is lower than the other. In particular I wish to point out that there is no such thing as transfer, much less promotion, from one to the other. The inequality is in training, pay, and conditions of service, but not in status.

The Provincial Service, however, ask for absolute equality in all respects with the Imperial Service. For the same responsibilities and the same duties they want the same pay. They fail to see that the living wage is different for the Indian-born and trained man and for the European whose domicile is not in India. Life (lodging, clothes, food), education, expenditure for leave on account of health, etc., and retirement are all different, and if a definite salary is sufficient for the Indian, it necessarily follows that it is insufficient for the European. This requires no argument or further proof.

The proportion of 2:3 in pay has usually been considered suitable.

If the pay for Provincial establishment is too low, that is, of course, a different question which I do not propose to contest. I think it is too low. The pay of an Assistant Engineer only rises to Rs. 475, which is less than a Sub-Engineer (Rs. 530), and the junior Executive Engineer only gets Rs. 535. I think it should be at least Rs. 635.

72,370. **(VIII.) Relations of the service with the Indian Civil Service and other services.**—The relations between the Public Works Department and other Services are harmonious and satisfactory.

72,371. **(IX.) Any other points within the terms of reference to the Royal Commission not covered by the preceding heads.**—The heavy cost of transfers has been referred to by the Imperial representative particularly. Some relief in this respect is wanted. In recent years there has been a tendency to cut down charges very much, and the result is that travelling is generally a source of loss for officers, and transfers invariably mean a heavy tax on their private purse.

It often occurs that in the interests of Government an officer is transferred several times at comparatively short intervals; the result is very disheartening, as he is bound to lose either by selling his effects or by moving them at greater cost than he can claim from Government.

* *Vide* paragraph 72, 373.

My opinion is that Government would be well advised to err, if at all, on the side of liberality. The removal for example of a vexatious order in connection with return railway fares, has been a move in the right direction, simplifying work and control, and avoiding discouragement.

72,372. *ANNEXURES.*

ANNEXURE 1.

ANNEXURE 2.

Note by the Committee of Temporary Engineers, Bombay Presidency, dated 5th December, 1913, *on the references contained in Government letter No. E-12052 of November 29th,* 1913.

1. *Methods of Recruitment.*—No special point.

2. *Systems of Training and Probation.*—No special point.

3. *Conditions of Service.*—A. In considering the conditions of service of temporary Engineers it should be borne in mind that temporary service with Government for an extended period limits the field of all Engineers' subsequent employment and practically confines it to India.

B. In view of the difficulty of finding situations in this country and with a view to lessening the feeling of insecurity which makes the work of a temporary Engineer more exacting and arduous than that of a permanent man, three months' notice to be given by either side to terminate employment instead of one month as at present.

C. Vacancies in the permanent cadre should be filled as far as possible by suitable temporary Engineers.

4. *Conditions of Salary.*—(*a*) Owing to the conditions of service and the fact that his employment is temporary and frequently made for emergent necessities of Government, the scale of pay should be on a more generous basis than that of permanent men of similar rank.

It is suggested that a temporary Engineer should receive 10 per cent. more than the salary which would be paid to a permanent man occupying a similar post.

(*b*) The pay of a temporary Engineer during the period of his employment by Government should be incremental on the same basis as that of a permanent officer.

(*c*) As a temporary Engineer is not eligible for pension his salary should be on a still higher basis in addition to paragraph (*a*) to enable him to insure for a pension or contribute to a Provident Fund.

(*d*) Temporary Engineers should draw all allowances sanctioned for permanent men.

5. *Conditions of Leave.*—These should be identical with those of the Imperial permanent service, but having regard to the temporary nature of his service the rules should be modified so that they do not militate against him adversely.

For instance, if his services are dispensed with he should be granted any leave that may be due to him. Further he should be entitled to furlough per year of service in the event of his employment terminating before he has served the full period qualifying him for furlough under the European leave regulation.

6. *Conditions of Pension.*—(*a*) A temporary Engineer cannot earn a pension owing to the nature of his service.

(*b*) It is strongly held that a Provident Fund with a subscription by Government should be instituted for all temporary Engineers on the following lines:—

The monthly subscription to be 12½ per cent. (*e.g.*, 2 annas in the rupee) of the salary and Government to contribute a further 75 per cent. on the amount monthly.

The whole to accumulate at 4 per cent. compound interest calculated monthly.

7. *Such limitations as may exist in the employment of non-Europeans, and the working of the existing system of division of services into Imperial and Provincial.*—No special point.

8. *Relations of the service with the Indian Civil Servce and other services.*—No special points.

9. *Any other points.*—It would be greatly to the advantage of Government that temporary Engineers who are specialists should have special consideration in respect of pay and leave on deputation to enable them to keep up-to-date in the advances of their professions.

ANNEXURE 3.

Memorandum from Imperial Engineers serving in the Bombay Public Works Department who were appointed to the Permanent Establishment after serving under covenant for five years on the Temporary Establishment.

(1) Appointment as Temporary Engineers:—

(*a*) These Engineers were appointed in England by the Secretary of State for India as Temporary Engineers on a five years' Covenant after selection by a Committee at the India Office. They were selected on the strength of their Engineering training and on their approved practical experience from a large number of applicants.

(*b*) The ages of these Engineers on appointment varied from 24 to 28 and all hold Engineering degrees.

Their practical experience in Great Britain varied from two years to eight years.

(2) Appointment as Engineers on the Permanent Establishment:—

From the Temporary Engineers so appointed, a certain number were selected and appointed to the Permanent Establishment, before or at the completion of their five years' agreements.

(3) Terms of appointment:—

The terms of the appointment were that their whole service on the Temporary Establishment was to count towards leave and pension but for purposes of promotion and seniority instead of counting full service, from 1 year to 15 months were deducted.

This latter condition meant that these Engineers who, even at the time of their appointment, were

considerably older and more experienced than Engineers appointed at the same date directly to the Permanent Establishment are in the seniority list one year or more below them.

(b) In some cases as much as 18 places are lost by this condition and the result is that they are placed on the seniority list below Engineers 2 to 8 years their junior, which, apart from the pecuniary loss involved, places them in positions which are at times embarrassing and undignified.

(c) In the case of the last appointments which were made shortly before the closing of the R. I. E. College, the deduction of 15 months from their service places them below men appointed to the Permanent Establishment, after the closing of that College.

These Engineers had the same training as those appointed from the Temporary Establishment but they are considerably younger and their practical experience was much less.

(4) It is pointed out that Engineers who leave appointment in Great Britain at ages varying from 24 to 28 and serve for five years in India are placed at a very serious disadvantage when they return home and apply for appointment, as it is between the ages of 25 to 30 that an Engineer, as a rule, becomes settled in his profession. These officers were, therefore, practically compelled to accept any terms which were offered.

(5) Attention is also invited to the fact that all the Engineers, appointed from the Temporary Establishment, are Executive Engineers or will be acting as such very shortly and that therefore if the concessions asked for are granted, it will not be in any way to the detriment of officers appointed direct to the Permanent Establishment, now or later, as it has been clearly laid down that appointment to the Administrative grades shall be by selection.

(6) They request that the Commission will consider their case and recommend that they may be allowed to count at least their full services, as Temporary Engineers, towards seniority and increment and further that due consideration may be given to their ages and previous approved experience at home, when determining their seniority, as has been done in at least one case in another Presidency where for purpose of counting promotion and seniority, at least two years were added to the officer's services on the Temporary Establishment.

ANNEXURE 4.

No. 1463-E.

Government of India. Public Works Department.
Establishments.

From Mr. L. M. Jacob, C.S.I., Secretary to the Government of India, Public Works Department; to the Secretary to the Government of Bombay, Public Works Department.

Simla, the 3rd November, 1905.

Sir,

I am directed to acknowledge the receipt of your letter and telegram noted in the footnote* on the subject of the permanent appointment to the Department of Messrs. R. W. Murphy and C. Johnston, Temporary Engineers under covenant with the Secretary of State.

2. In reply I am to point out that the proposal made in paragraph 2 of your letter under reply that such men on being made permanent should be graded as supernumeraries in the Department is an unusual one. Many Temporary Engineers have been brought on to the permanent establishment in various provinces from time to time, and the invariable rule has been to accord them a position in the regular list which would be fair to them in consideration of their age and length of service, and the Government of India would suggest that the same plan should be followed in the case of these Temporary Engineers in Bombay whom it is desired to bring on to the permanent establishment.

3. I am to explain that under the system of promotion at present in force as governed by the rules in paragraph 62 of the Public Works Department Code, the Government of India are in a position by a proper adjustment of the limiting scale to regulate the rate of promotion in the different cadres to correspond as nearly as possible with the limit of time laid down as reasonable for promotion to the various grades, so that there can at no time be a serious block of promotion in any of the Executive and Assistant grades. This, in fact, they do; the limiting scales being revised each year, and if it is seen that a block in any grade is likely to occur, the limiting scale being adjusted to remove it. This being so the Government if India are of opinion that there is very little hardship, if any, to the permanent staff in bringing in a Temporary Engineer into the permanent Establishment otherwise than at the bottom of the list since the disturbance of the list can be remedied at the next annual revision of the scale. It is true that the introduction in this manner of additional officers into the scale may ultimately result in a slightly larger number of Executive Engineers, 1st Grade, at a given time than would otherwise be the case and so diminish to some extent the chances of promotion to administrative rank, but the retardation of promotion due to this cause would in any case be very slight. I am, therefore, to suggest that the proposal of the Government of Bombay in regard to Messrs. Murphy and Johnston may, with the consent of His Excellency the Governor in Council, be reconsidered in the light of the above remarks.

I have, &c.
(Sd.) E. G. Stanley,
Under Secretary to the Government of India.

Documents Accompanying:—
Nil.

ANNEXURE 5.

No. 842-E.

Government of India. Public Works Department.
Establishments.

From Mr. L. M. Jacob, C.S.I., Secretary to the Government of India, Public Works Department; to the Secretary to the Government of Bombay, Public Works Department.

Simla, the 2nd August, 1906.

Sir,

With reference to correspondence ending with your letter No. E.—488, dated 23rd February, 1906, I am directed to state that, on the recommendation of the Government of India, the Secretary of State for Inda has been pleased to sanction the appointment of Messrs. R. W. Murphy and C. Johnston, covenanted Temporary Engineers to the permanent Engineer Establishment of the Public Works Department in Bombay on the following terms:—

I. They will be granted the Imperial rates of pay.

II. Mr. Murphy will be appointed Assistant Engineer, 2nd Grade, and Mr. Johnston, Assistant Engineer, 3rd Grade.

III. They will come under the leave and pension rules applicable to officers now appointed to the Public Works Department in England.

IV. They will be allowed to count service for purposes of leave and pension from 5th January, 1901 and 12th December, 1902 respectively, the dates on which their services as covenanted Engineers commenced.

V. They will be allowed to count service for purposes of promotion from 5th January, 1902 and 12th December 1903 respectively.

VI. They will be allowed exchange compensation allowance while serving in the Assistant and Executive grades only.

2. I am to request that permanent appointment in the Department on the above terms, may now be offered to Messrs. Murphy and Johnston and on their acceptance being intimated to the Government of India the usual notification appointing them per-

* Letter No. E.—2128, dated 18th August, 1905 } not
Telegram No. 373 T., dated 24th October, 1905 } reprinted.

manently to the Public Works Department will be issued.

3. It will be observed that under item V of the terms Messrs. Murphy and Johnston are to count service for purposes of promotion from 5th January, 1902 and 12th December, 1903 respectively instead of from 5th January, 1901 and 12th December, 1902 as originally proposed. This alteration, I am to say, has been made at the suggestion of the Secretary of State and has been adopted in the case of other convenanted Temporary Engineers recently appointed to the permanent establishment in the Punjab, in order to maintain the seniority of their contemporaries who were appointed permanently to the Department.

I have, &c.,
(Sd.) F. C. Dover,
Offg. Under-Secretary to the Government of India.

72,373. *Supplementary Confidential Written Statement by Mr. H. F. Beale.**

THE VALUE OF THE INDIAN.

The reports from the Department are as follows:—

(*a*) the Europeans report adversely upon the Indian for independent, responsible positions, and favourably for positions where he will be under guidance;

(*b*) the Indians extol the ability of their own men. I may quote Mr. Chitale, a very senior Executive Engineer, who was tried but found unfit for administrative duties. He writes:—"The good points of the Indian Engineers are their continuous hard work, steady habits, general intelligence, close supervision of, and co-operation with, the subordinates under them, which are necessary qualifications for getting the work done cheaply and preventing frauds. They are, however, yet looked upon with suspicion and their good points are not often brought out."

Our effort is to get the best we can for Government out of the department. If we appoint a Superintending Engineer and he submits papers from his Executive Engineers "for disposal," or "agreeing" or making some remarks which any man might do from his chair, we call him a post office. I may instance a recent case in which a Superintending Engineer forwarded "for early orders" suggestions made by a contractor for the foundations of an important work without any comment whatever. All kinds of mistakes will pass an officer of that kind, and one will never look to him for an exhaustive report or for the expression of an opinion of value.

This is rather the type of Indian we have had as Superintending Engineer, but there have been two or three notable exceptions.

As a subordinate and an Assistant Engineer even, the Indian is quite good.

Under a zealous officer he will work well, and having a guide he moves on with confidence.

As an Executive Engineer he has the following advantages:—

(*a*) knowledge of the people, language, and country, excepting Sind;

(*b*) the confidence of the people, if he is a straightforward and friendly man;

and he should be able to make good use of the experience gained as a sub-divisional officer, but he has certain disadvantages, *viz.*:—

(*c*) he lacks prestige, unless his training enables him to hold his own in any society;

(*d*) his independence in public duties is interfered with by family ties;

(*e*) a fear of local unpopularity will affect him very much, while a European would hardly be aware of it;

(*f*) caste prejudices which often make him favour the higher caste men in preference to the lower;

(*g*) he may be subjected to temptation in places where the inborn feeling of the people is that a private remuneration must precede all useful effort, especially in the case of large contracts or special appointments: such temptations are seldom put before Europeans, because of the futility of the offer or of the physical danger involved in the process.

Then in a general way (it must always be understood that there are many exceptions) the Indian is not able to bear exposure better than, and often not as well as, the European, or perhaps it is that the latter spares himself less; the Indian seems less keen about details of work and supervision, and he has a known disinclination or disability for manual work, hence lacks some useful experience.

The Indian may be described as capable of good work, having mental ability and shrewdness and often great keenness for his duties, but as wanting in self-reliance, vigour of effort and of management, and of reliability. He is also apt to be very partisan or excessively lenient in his reports. An unfortunate and very great disadvantage he has (and it is only a few who can get over this) is his social disability. The caste system begins by making him exclusive, so he does not readily learn how to consort with officers of his own and other services. Thus he naturally tends to avoid them, is little known, and not as popular as he would otherwise be.

This feature reduces the level of our Public Works Department very materially. It is easy to mention numerous other Indian gentlemen who are very well received in society, having a good appearance and good address. If all our officers were to cultivate a higher social refinement it would be a very great advantage both to themselves and to the Department as a whole, and mutual intercourse with their fellows of all creeds and castes would help them in their every day life and work.

There is, I believe, too great a tendency for men, who do not consort with their equals in rank, to hob-nob with subordinates, which after all is only natural, as they were probably all brought up together, but it impairs discipline and certainly lowers very much indeed the prestige of the Department.

The objection to Indian Engineers in Sind is most marked. The Zamindars dislike them, and can for some reason or other not feel for them a due respect, even for a good, earnest, and active officer. The Brahmin is absolutely out of his element in Sind, and the other Indian gentlemen recruited in our Department have not the manner which the Sindhi Zamindar admires.

Mr. H. F. Beale, called and examined.

72,374. (*Chairman.*) The witness was Chief Engineer and Secretary to the Government of Bombay, and had held his present post since October, 1912. He joined the service in October, 1882.

72,375. He suggested that certain senior members of the Public Works Department should be added to the committee of selection in England to assist the committee in discovering the class of candidate best suited for India. They might be officers of the service on furlough or men who had just retired from the service.

72,376. Recruitment to the Provincial Service was generally satisfactory, but upper subordinates should be promoted to the Provincial Service at an earlier age. At present the promoted men were nearly always sub-engineers of about fifteen years' service, whereas he would prefer to promote them after eight years' service. The fact that they were placed over the heads of others in the service would not cause friction.

72,377. Recruits from the Royal Engineers were occasionally taken into the department, and two young officers had been appointed within the last two or three years. They took their seniority according to the date on which they entered and came in at the bottom of the list. Provided a Royal Engineer was recruited to the Public Works Department fairly young, there was no hardship to him or to the service. As a rule, a Royal Engineer had two or three years' service before coming into the department.

72,378. The last temporary engineers to be made permanent were two officers in 1911. There were twenty temporary engineers in the department, and ten in special posts. Two or three more appointments

* Mr. Beale was examined upon this written statement *in camera*.

would be made shortly. Although temporary engineers were recruited for certain constructional work, their services were not dispensed with when that work was completed, as constructional work was continually going on. No distinction was made between men employed on constructional work and on maintenance work, and officers might be transferred from one class of work to the other at any time. Probably next year another ten temporary engineers would be entered on account of additional work. The additional men were required in the junior grades, not in the executive grades, but the Government of India would not allow the increase of cadre of permanent men to be brought in when applied for on the ground that if too many men were put in the junior grades the senior men would suffer. Amongst the temporary engineers now in the department there were seven with more than five years' seniority, five with more than ten years, and one with more than fifteen years. He was not in favour of transferring those particular men to the permanent cadre.

72,379. Practical training in England gave men some idea of engineering life after their career as students, bnt was not otherwise of very great value. If a man had less than a year's experience in England he was entered as a probationer in India, but in the case of those who had had several years' experience, probation was dispensed with. The rule as to probation had only been in force for the last two years.

72,380. An increase in the cadre was necessary both for maintenance and construction work. As a rule permanent men were employed on construction work, and temporary men were employed on maintenance work. At present there was a good deal of building construction going on and a large amount of irrigation work; there were two very large projects in irrigation, and a third was about to be sanctioned, and when the Sukkur scheme began a vast increase in the number of engineers would be required.

72,381. If constructional work were carried out by private firms it would mean a reduction of the establishment, and the Government would have great difficulty in finding men to do the work which came within the range of the department. It would be quite possible to have work done by a private contractor, even irrigation work, but it would not pay the State to reduce the permanent establishment of the department. The cost of work by private contract would be probably in excess of the cost of work done by the department. Also there was a large amount of miscellaneous work; an Executive Engineer in charge of a district had to work out all kinds of problems while he was engaged in constructing large buildings. Looking at the question broadly, however, it would be undoubtedly of advantage to the country to have work done by private enterprise if it could be done sufficiently well.

72,382. In describing as unfair the order that an Executive Engineer not holding a district charge should not draw more than Rs. 800 in the Imperial or Rs. 535 in the Provincial Service, he was assuming that an engineer was an efficient engineer, and that for the moment an executive charge was not vacant. It did not seem fair that a man should suffer because the department had been over-recruited, and if a man could not receive an appointment he should receive his increments of salary just the same. The conditions were quite different in respect of temporary engineers, as a temporary engineer could be always on the lookout for other employment. He took work in India for a time and gained his experience, and then he could go to any other part of the world at his own price. There was no reason whatever why he should have a constant increment. In practice he remained in the department, but that was simply because he obtained better terms than he could obtain elsewhere.

72,383. No reply had been received from the Government of India with regard to the proposal to grant presidency allowances. The Superintending Engineer in Bombay should also be granted an allowance, in addition to his present salary, otherwise there was just the possibility of an Executive Engineer getting as much pay as a Superintending Engineer. That in itself, he admitted, was not a very strong argument, but he maintained that the Superintending Engineer, whose headquarters were in Bombay, was worse off than the other Superintending Engineers, and should receive a Presidency allowance.

72,384. He did not object to the 10 per cent. rule for the appointment of Indians in England, as he believed that Indians with sufficient enterprise to go to England to study should have their reward. It was not essential that an Indian Engineer should have an English training so long as the service was divided into Imperial and Provincial branches. He had been told that if the title of Provincial was abolished, and the difference in pay was retained in the shape of a foreign service allowance, the discontent would to a very great extent be allayed. There was a feeling amongst Provincial officers that they were considered of lower rank than Imperial officers, and if that was the construction put upon the term Provincial it should be abolished.

72,385. There was no difficulty in obtaining recruits to the provincial service on the present salaries, but it was said that the salaries were insufficient. A junior Executive Engineer on Rs. 535 was on a very low rate of pay having regard to his responsible position, and the salaries of the Provincial branch of the Public Works Department did not compare favourably with the salaries of other Provincial services.

72,386. It was very important that increased transfer allowances should be granted, as officers now had to spend money out of their own pockets invariably when they were transferred from one district to another.

72,387. (*Lord Ronaldshay.*) He did not say that all Royal Engineers would come in at the bottom of the list. Tht two men recently appointed had come in at the bottom. If a senior Royal Engineer were brought into the department he should come in with an increase in the cadre, and then there would be no friction.

72,388. If work was done by private contract it would be still necessary to have an Executive Engineer in charge of every district and subordinates in charge of sub-divisions.

72,389. The pay given to a European engineer was based both on the expense of his training and the conditions of service in a foreign country, and did not necessarily imply that his services were more efficient than a provincial engineer.

72,390. In the Bombay presidency a considerable number of temporary engineers were employed in charge of sub-divisions, chiefly owing to the fact that the subordinate establishment was under-manned. If the subordinate establishment was brought up to a proper strength and the training of the officers was improved, it would be possible to draw the sub-divisional officers from the subordinate establishment and thus to reduce greatly the number of temporary engineers.

72,391. (*Sir Theodore Morison.*) In estimating the cost of work the department did not take into account non-effective charges of the establishment, but the effective charges were calculated and added to the cost of the work.

72,392. (*Mr. Sly.*) The system followed in the Bombay presidency for the construction of large works was generally a system of petty contracts and departmental labour, but constructional work was also given to local contractors. Work was done in three different ways: it was given to large contractors, or divided up into petty contracts, or done by departmental labour. There was a large number of reliable contracting firms in Bombay city and a great deal of the construction work in the city was done by them, but he did not think the State would gain if the whole of the work was done by contract. The establishment maintained in Bombay city was large enough to undertake direct construction on a large scale, and if constructional work was put out to contract the establishment would be very largely decreased. It would not be a wise thing to do this as it was always necessary to have something to put up against contractors.

72,393. There were reliable firms of local contractors in the districts who were quite able to take up large jobs of work. The maintenance of works and repairs could not be carried out by contractors and an establishment would have to be maintained for that.

72,394. The Provincial service recruited one candidate every year from the Poona college and one pro-

moted subordinate every other year. As a rule the promoted subordinate was an old man who had been in the subordinate service for over fifteen years and was not a suitable man for the Provincial service. It would be better to select a young man from the subordinate service, as he would be trained in exactly the same manner as the direct recruits coming from the same college and sometimes being only a few marks lower in the examination than the Provincial recruit. The fact that one had four years in the college and the other three made no difference to the class from which they came. The man who spent another year at the college only did so in order to have a better chance of getting the appointment.

72,395. He did not favour a central college for all India for training provincial service men. The college at Poona was very efficient and was being improved year by year and it would be a great pity to reduce its value.

72,396. Admission to the Provincial service was not restricted to statutory natives of India, as any man who entered the college had a right to be appointed to the service. He did not think, however, that a European would come out to India and enter the Poona college with the object of getting into the Provincial service.

72,397. If an officer in the Provincial service was sent to England for one year's training in practical work it would be desirable that he should go after about five years' experience of Engineering work in India.

72,398. Probably it would be true to say that a temporary engineer after having been employed for a certain number of years in India would have little chance of work in England, but he would still be valuable for service in other parts of the world, even for irrigation work. There was a good deal of irrigation work in Canada, for example.

72,399. (*Mr. Madge.*) The men who were selected for the Provincial service came from the same class as those who were in the upper subordinate service, but a man promoted from the subordinate service to the provincial might be out of his element owing to the long time he had spent in the subordinate service.

72,400. The time had not come to make over the whole work of the Public Works Department to private enterprise. He agreed that private enterprise should be encouraged and that local contractors should be employed to a great extent; in fact, they were freely employed and always would be employed.

72,401. If the cadre were increased in the proportion that had been asked for there would be an excess of Assistant Engineers compared with officers in the superior ranks.

72,402. The objection to bringing temporary engineers into the cadre after approved service was that they could only do so to the prejudice of officers belonging to the permanent staff.

72,403. He wanted power to discharge a man for inefficiency at any time and he did not believe that this would be detrimental to recruitment. It would be of great advantage to have the power, and if the discharged man was given a bonus he would not be hardly dealt with. There had been cases in which men had been found to be inefficient long after they had completed their probation.

72,404. (*Mr. Abdur Rahim.*) He did not wish any special inference to be drawn from the figures given in the written statement as to the number of European and Indian officers who died or retired. The figures showed that a large number of Europeans had retired before fifty-five years of age as they had the option to do so. The Indians, however, had no such option and that might explain the difference in the figures. He had not meant to compare Europeans with Indians, but only put the table forward as interesting in connection with the pension question. He had not brought out in the written statement all the facts which might be deducted from the table.

72,405. (*Sir Valentine Chirol.*) To give out the whole of a contract including both the design and execution of the work, and to leave the department simply to act as clerk of works, would be to alter the whole of the present system. The designing of works was all done in the department,—with the aid of consulting architects and other specialists when necessary. It might be that the works already designed had not been so successful as to justify the claim of the department to a monopoly of design, but he thought if the designing of buildings was left to private contracts the country would in many cases suffer greatly. The duty would then fall upon the Department of criticising the designs, and possibly of making out fresh designs. If the door were opened to large contractors, there would be a number of firms to select from, and the Department was already using local contracts to a large extent. The experience of the Department had been that they could do large works at present more cheaply than English contractors could do them, but he could give no definite figures, as tenders had not been invited for recent large works. It might be advisable gradually to extend the system of putting large works out to contract so as to see whether work could not be more efficiently and more cheaply carried out by private enterprise, and the encouragement given to contractors might be desirable in the interests of the country.

72,406. All Provincial service men were drawn from the College of Engineering in Poona. The first man in the examination received an appointment in the Provincial service and the others went into the upper subordinate service. He did not want to increase the number of subordinates promoted to the Provincial service; at present one man was promoted every second year and that seemed quite sufficient. With a larger number of subordinates in the subordinate service it might be possible to dispense with the recruitment of temporary engineers, but he would not increase the proportion of subordinates promoted to the Provincial service.

72,407. (*Sir Murray Hammick.*) A number of officers had retired before attaining the age of fifty-five, but he could not remember a single case where an officer had retired on the completion of twenty years' service.

72,408. The department had never given out large constructional work to a London firm, but probably would do so if it promised to be more economical. Large buildings were given out to local contractors and every bit of the work was supervised by the department. There would be no difficulty whatever in making contracts with private firms. Even if that were done it would not allow the staff of the department to be reduced to any great extent in the districts. On the Sukkur scheme there would be a large number of Executive Engineers, Assistant Engineers and subordinates, and it would be possible to reduce their number by 50 per cent. if the work was given to a large contractor. No consideration had been given to the question of reducing the establishment in that way.

72,409. He had heard it said that Provincial officers were every bit as good as Imperial officers. He knew of certain cases where men had gone to England from the Poona College and after a period of training in England had got into the Imperial service, and obviously these were better trained men than the men who were trained in India only.
